COAL AGE

LIBRARY
UNIVERSITY OF ILLINOIS
URBANA

INDEX FOR VOLUME VI
July 1 to December 31, 1914

Note—Illustrated articles are denoted by an asterisk (*), book notices by a dagger (†). Titles are often abbreviated. They are indexed under their most important words, or, if no word be distinctive, under their first one (except "A," "The," etc.), or under some topical word not found in the title. Authors', geographical and other proper names are also used freely. In some cases references to subsequent discussion are appended to a writer's name.

Following is a list of the pages included in the several numbers of the volume, by date:

July	4	pages	1-50
"	11	"	51-92
"	18	"	93-132
"	25	"	133-168
Aug.	1	"	169-212
"	8	"	213-252
"	15	"	253-290
"	22	"	291-328
"	29	"	329-368
Sept.	5	"	369-410
"	12	"	411-452
"	19	"	453-490
"	26	"	491-530
Oct.	3	"	531-574
"	10	"	575-616
"	17	"	617-656
"	24	"	657-696
"	31	"	697-736
Nov.	7	"	737-776
"	14	"	777-814
"	21	"	815-854
"	28	"	855-892
Dec.	5	"	893-934
"	12	"	935-972
"	19	"	973-1010
"	26	"	1011-1048

COAL AGE

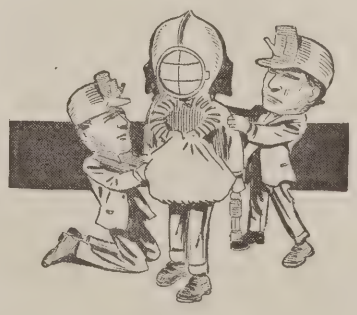
Vol. 6 NEW YORK, JULY 4, 1914 No. 1

Brothers

By Berton Braley

Written expressly for Coal Age

When things seem peaceful-like and calm
The racial ructions rise,
The Polack mixes with the Greek
The Lithuanian tries
To beat his Russian brother up
And bung the Austrian's eyes.



There's trouble twixt the Dutch and French
And all their kith and kin,
The Irish battle with the Swedes
The Croatian with the Finn,
And all the mine and camp is filled
With Inter-racial din!

But when disaster strikes the mine
And women wail their woe,
When fire or gas or dynamite
Has dealt a deadly blow,
When there's a call for volunteers
To dare the Hell below,

THEN Russ and Hun and Celt and Gaul
Lay by their racial pride,
To rescue those who still may live,
And bring up those who died,
The foes in many a long fought feud
Work nobly side by side.

And when the hero list is made
Of those who dared the flame,
There will be men of every race
And every sort of name,
For Austrian, Bulgar, Finn or Russ,
Brave hearts are just the same!

Ideas and Suggestions

Stopping the Leaks

SYNOPSIS—You don't get good results from your automobile engine when there is a loss of compression. It means the cylinders are leaking. Your business is just like that. Every little leak takes that much power and profit out of your organization.

Carefully gathered figures were recently presented in an article in COAL AGE showing the average net earnings of all coal-mining concerns in the United States to be less than 5 per cent. No doubt many individual companies could present statements showing a much better return than this; but, on the other hand, entirely too many concerns are making showings not even as good as 5 per cent., year in and year out.

The advertisers in COAL AGE are continually pointing out to coal-mining men that it pays to be alert and alive to the opportunities for increased production and economy afforded by the use of modern and up-to-date equipment.

In almost any journal the mining man may pick up, "Scientific Management" and "Efficiency" are preached to him until he no doubt wonders whether some of the expert advisors really believe or know anything about what they preach.

I wonder if you coal-mine managers, superintendents and auditors who were surprised to learn that the average earnings of all coal-mine concerns is less than 5 per cent. net, stopped to think of how much the total of small leaks in your own company contributed to this result? Maybe you took it for granted that your corporation was not a contributor because your last annual statement was very good looking. If so, YOU are the very man these remarks are intended to reach.

PROFIT BY THE MISTAKES OF OTHERS

Managing a mining enterprise or running a coal mine is very much like running your own business. You have a lot of experience, hear and read a lot about the other fellows' troubles, and get a world of advice; however, out of it all you take only what you like and use it. As your attention is called to leaks disclosed in the other man's business, such as payroll losses, storehouse shortages and accumulations of excess and obsolete stock, you think, "Well, we're all right there," and let it go at that. It's easy to get advice, but so hard to take it. The man who is profiting by the mistakes of others is hard to find. Those who prove that they can are holding down good jobs. If you find one running loose, it will pay you to hire him.

Take your payroll; it is the largest single item of your operating expenses. Have you ever considered that you ought to safeguard your timekeeper and your payroll in every possible way? Do you let your timekeeper make up your roll and pay it, too? If you do, change your method as soon as you can. It's asking too much of a man who usually doesn't draw a princely salary anyway to do this kind of thing month in and month out. It resolves itself into a condition where the plan itself insistently urges a man to become dishonest with little fear of detection. It isn't fair to the man to permit such a condition to exist, to say nothing of the possible loss to your business.

THE REMEDY

Don't let a timekeeper pay his own roll. Have some one check his work thoroughly, and have still another man do the paying.

Let us look at your supply house. Are you keeping any kind of daily, weekly or monthly inventory of what you are carrying? Is your stock classified so you can have statements drawn off which will exhibit the amount of material of any class on hand, average used per month and number of months' supply on hand?

You don't want to carry two kinds of packing of the same size and grade, do you? Maybe you'll find you are. Your new master mechanic won't use the brand of packing your former master mechanic liked, so he has put in a good stock of his particular brand. The old kind may stay on the shelves and deteriorate or rot. *The remedy for this*: Standardize your packing, along with a lot of other material which can be standardized, and make the soliciting agents go direct to your purchasing department when they want to sell you stuff.

Remember, it costs good money to keep a storehouse full of mine spares, especially in this day of costly electrical equipment. Excess stock will soon tie up a sum of money, the interest on which will pay the manager or superintendent who has learned how to avoid this—the kind of man who knows how to profit by the other fellow's mistakes.

APPOINT AN INVESTIGATING COMMITTEE.

Think it over, and don't dismiss this idea of getting after the small leaks until you have at least formulated a plan for discovering whether they exist in your business. *How can you do it?* One good way would be to appoint a standing committee of members of your departments, your storehouse keeper included. Frequent visits to the storehouse by a committee like this will bring to light stock that is in excess of requirements or apparently obsolete. The same committee may canvass other features successfully, such as the study of production figures, etc. Quarterly or semi-annual inventories of machinery and material inside the mine will also bring to light many items that may be used in such a way as to accomplish a real money saving.

[*This is an important subject. Cannot some of the* COAL AGE *readers tell us how they have stopped leaks in their own companies?—ED.*]

The gallery at the Rotherham rescue station in Yorkshire is so arranged that two teams may be at work at once, while the instructors, through a glass partition and door, can see exactly everything that is happening and ventilate at once in case of necessity; the equipment includes a powerful exhaust fan driven by electricity.

Applying the Methods of Scientific Management to Coal Mining

By H. Alexander Dean*

SYNOPSIS—There is no reason why scientific management, which has accomplished much in industrial works and processes, should not be applied with equal benefit to coal mining. An outline is here given of how this application might be made.

In an article entitled, "Does Bituminous Mining Pay?" published in Coal Age for Sept. 20, 1913, and reprinted in the *Electric Journal* for November, 1913, which attracted much attention and favorable comment at the time, A. E. Rickards, general manager of the Industrial Engineering Co., of Pittsburgh, said in part:

> To make a profit with the low selling price and the continual increase in the cost to produce coal is indeed a problem. One solution is to increase the output.
>
> Mr. Edward W. Parker states that "the present bituminous mines of the United States are capable of producing 600 millions to 700 millions of tons per year without opening another new working." To do this, of course, requires ample transportation facilities and plentiful labor supply.
>
> . . . From the foregoing it is seen that the capital account has reached such proportions that the future profits must be obtained through greater output and greater economies in the operation of the workings, and the investment must be kept down to a minimum.

The above quoted article is a lucid and powerful argument for the reduction of operating costs by the use of central-station electric power for all requirements about the workings.

The same reasoning and the same statistics, so far as they show a decreasing margin between cost of production and selling price of the product, are equally potent as arguments for the application of the principles of scientific management, which have been so successful in realizing economies in a great variety of manufacturing industries, to the mining of coal.

It is my purpose to sketch briefly a few of the most obvious practical applications of some of these well known principles to the operations in and about coal mines.

The latest available statistics of the coal-mining industry (those of 1912), give a total production of bituminous coal of 450,000,000 tons, with a total production cost per ton as follows:

Direct labor per ton	$0.5425
Indirect labor (day work)	0.2383
Salaries	0.0575
Supplies	0.1305
Royalties	0.0320
Miscellaneous expenses	0.0530
Total per ton	$1.0538

Assuming that as claimed by competent authorities, the output from the same workings might have been 600,000,000 tons, an increase of 33⅓ per cent., with little advance in the expenditures, let us see how this increase in output would affect the production cost per ton.

Direct labor and royalties probably would remain about as before, but the other expense items would show a reduction due to the increased output about as follows:

Direct labor per ton	$0.5425
Indirect labor (day work)	0.1790
Salaries	0.0432
Supplies	0.0978
Royalties	0.0320
Miscellaneous expenses	0.0400
Total per ton	$0.9345

This shows a decrease in production cost per ton of $0.1193, or 11.4 per cent., due simply to increase of tonnage produced.

The question is immediately asked by the practical mine manager as to the possibilities of getting out such an increased tonnage without large increases in operating expense.

The answer to this question in regard to the increased production of coal is the same as that given to plant managers regarding increased production of castings from a foundry or finished parts from a machine shop, viz.: *competent counsel.*

The practical mine manager is doubtless an expert as regards methods of cutting coal, getting it out of the mine and marketing the product. But counsel is necessary regarding the economical handling of labor; the planning in advance of work so as to avoid delays which invariably mean added expense; the setting, so far as possible, of standard tasks, and the payment of extra inducements to the workers for attaining these standards. The *square deal* on the part of the management toward the workers is essential that there may be harmonious coöperation instead of discontent, insubordination and distrust.

Production Must Not Be Interrupted

The mine must go on producing coal while these various innovations in the management methods are being worked out, and in order to save time and expensive mistakes in starting the work, a competent efficiency engineer should be employed to take charge of the new work and organize a production department, which will, in time, become a permanent part of the organization.

It is a fact verified by reliable investigators in thousands of observations, that the manual laborer seldom, if ever, delivers over 60 per cent. of the output of work of which he is reasonably capable, unless some special provision is made by the management for rewarding him for the extra effort and for avoiding delays in the continuity of his work.

Hence arises the necessity for a production department, which shall plan the work for each man or gang, standardize as far as possible the tasks to be performed, record the individual performance of workmen under these standards, and see that the workers receive a proper share of the benefits that accrue from the increased production.

In the first place production is kept far below the possible maximum by the lack of advance planning of the work in the mine. Each day a plan sheet should be prepared covering the proposed operations in the mine for the succeeding day, which plan sheet should show the number and location of each working chamber or room with the name or check number of the miner working therein, and the allotment of cars for that day.

In a large mine the workings may be divided into sections of a convenient size, and a plan sheet made out for each section.

A service card containing the above information should be issued to each miner as he enters the mine and stamped with the time of starting work. This should be taken up when the miner comes out, the clerk stamping on the card the quitting time and entering the number of cars reported as loaded by the miner, as a check on the reports from the tipple.

After the plan sheet is made out, the next item in im-

*Sewickley, Penn.

portance is a cutting schedule for the machine men, which should be arranged by the pit boss in such a manner as to be most economical of time in the movement of the cutting machines from room to room.

The next point in order is the preparation of a car-delivery schedule, which should be worked out in detail so that each working room receives its proper quota of cars as needed, taking into account the operations of the machine-cutting gangs, for it is obvious that no cars will be needed at a room during the hour that the cutting gang is working there.

This schedule distribution of cars should be handled by a car dispatcher, located where the trips of empties are made up, and he should have before him constantly a dispatching sheet, on which to note down the cars sent in to each room and the number of loaded cars brought out by the haulage men. The haulage crews should receive from the dispatcher instructions as to the disposition of each trip of empties taken in.

This plan properly worked out as to details will give the maximum use of the available cars in the mine insuring that the miners in the working chambers are supplied with cars at regular intervals and in sufficient number, and above all it should provide a constant and ample stream of loaded cars at the foot of the hoist, or at the dump, so that alternating periods of congestion and idleness will be avoided.

The car dispatcher's tally sheet should record all the trips of the haulage crews, showing time started, number of empty cars taken in, with their destination, time returned, number of loaded cars brought out, elapsed time for the trip, and causes for any delays.

A constant check on the work of the haulage crews with the necessity for adequate explanation of all delays will work wonders in securing promptness and continuity of service in this all-important division of the work.

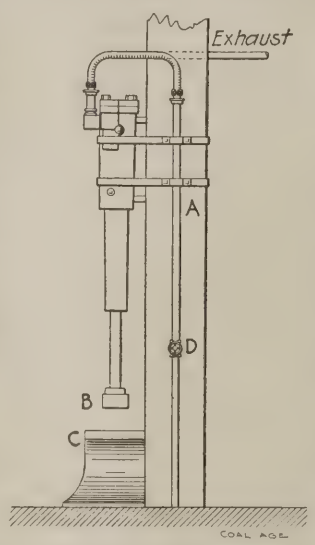
A thorough study of the work of the cutting-machine gangs will soon enable the production supervisor to standardize their operations and offer a bonus inducement for saving time, particularly in moving from room to room and in setting up their machines, thus securing a greater output from these productive units.

The method so far outlined will, if developed and applied with care and judgment, result in large increases in the output of the workers, who are primarily responsible for the amount of coal produced, and the same careful study devoted to the use of the nonproductive labor about the workings will reveal many opportunities for savings.

All material and supplies should be kept in the charge of a storekeeper and issued only on requisition signed by a responsible authority, and stating the use for which the supplies are drawn and the account to which they are to be charged.

In order that the mine manager may at all times keep in close touch with the production costs in his mine, he should receive, at least once a week, a statement from the cost department, showing the following details of operation:

(1) Number cars coal hoisted.
(2) Number cars slate hoisted.
(3) Tons of coal shipped.
(4) Mining labor per ton.
(5) Inside nonproductive labor per ton.
(6) Tipple labor per ton.
(7) Repair labor per ton.
(8) Power-plant charges per ton.
(9) Supervision and office per ton.
(10) Materials and supplies per ton.



The manager should himself plot these results on graphic charts, so that the relation of these items in his cost of production are brought sharply to his attention and any undue rise in any item may be immediately investigated and the cause remedied.

The practical working out of the system, as outlined above, will not require the addition to the payroll of a large number of nonproductive clerks or timekeepers, or the introduction of large quantities of useless red-tape, but, on the contrary, can probably be worked out by utilizing men already on the payroll, simply by changing the character of the work they are doing, under the direction of a competent efficiency engineer.

A Novel Steam Hammer

One of the important elements that enter into the successful operation of a coal mine is the ability to utilize material that has outlived its usefulness in the place or for the work it was originally designed to accomplish.

An example of this recently occurred at our mine, in the adaptation of a discarded coal puncher for use as a steam hammer, in the blacksmith shop. A large coal-punching machine, which was no longer needed in the mine, was taken into the shop on the surface, where it was strapped and bolted to an upright beam or pillar *A*, as shown in the accompanying sketch. A tool-steel hammer head *B* was fitted to the end of the cutter shaft and an anvil *C* placed underneath this to receive the blows.

COAL PUNCHER USED AS A STEAM HAMMER

This improvised steam hammer was found to be very powerful and proved the means of saving much time and labor. The hammer is operated by steam from the boiler house and its action controlled by the small globe valve *D*. I thought that this item might be of interest to some coal operator who may find it of advantage to make similar use of a discarded machine.

BY THE WAY

Saving is a greater art than gaining.

It is better to do well than to say well.

The way to be safe is never to feel secure.

The man that parleys has half surrendered.

It's foolish to try and fly like an eagle with the wings of a wren.

He who has lost his reputation, is a dead man among the living.

It's unfortunate when a man's palate has quicker sensations than his heart.

Prosperity tries the human heart with the deepest probe and brings forth the hidden character.

Coking Possibilities from Different Viewpoints

By H. S. Geismer*

SYNOPSIS—Notes on the methods, troubles, misunderstandings and squabbles of those who furnish the coal, those who make the coke and those who employ it in metallurgical processes.

The man in charge of a coking operation can appreciate the expression "between the Devil and the deep blue sea."

Between the blast-furnace manager who is calling for better and cheaper coke and the coal-mine manager, who is always calling for better weights and less rigid inspection, he finds his time well occupied. Even where one operating company has charge of the mines, ovens and furnaces, disputes are not entirely eliminated, but, under such circumstances, it is at least possible to arrive at the most economical basis for the combined operation.

To intelligently criticize the results obtained from any coking operation, three tabulations are required: "A," cost; "B," yield; "C," quality.

In what follows when we refer to cost, we mean total cost of coke, including that of the coal used: by yield, we signify yield of coke expresed as a percentage of coal charged.

In judging a coking operation, three different interests must be considered:

1. The blast-furnace man who uses the coke; he is principally concerned with quality.

2. The plant manager, who has charge of manufacturing the coke; he is principally concerned with cost. His cost, however, is largely a question of yield.

3. The coal-mine manager, who furnishes the coal to the ovens; he is principally concerned with the yield since his tipple weights are largely judged by tons of coke produced, especially when there is no chance to check coal weights as charged to ovens. As a matter of course, the quality of coke depends largely upon the quality of the coal furnished, but the mine manager dodges that issue whenever possible.

As most coke complaints originate at the furnace, we will consider the furnace-man's troubles first:

An Alabama Coking Operation

At a certain furnace plant, a coke was tried that, according to analysis, should have given fairly good results, but it was noticed that whenever the admixture of this fuel in the furnace exceeded 50 per cent. of the coke charge, the furnace began to "stick." The manager suggested that in some way, this coke was evidently running up the percentage of alumina in the burden. An analysis of the ash in the coke was then made and the percentage of alumina was found to be extremely high.

Since the alumina in a coke can only be introduced through ash in the coal, an investigation was begun at the mine and it was found that the coal was not being properly prepared. Much slate was being loaded by the miners and the washer was not giving a good product. After correcting these evils, the coke produced gave satisfactory results in the furnace.

At another time, at this same furnace, the coke con-

*Birmingham, Ala.

sumption (pounds of coke required per pound of pig iron produced) began to climb, and careful examination of this fuel, as it was being unloaded from the railroad cars, indicated that it contained a large percentage of spongy ends and jamb coke, as well as too much breeze and pieces of firebrick. Such irregularities are supposed to originate only at the ovens and the investigation was continued to that point of the company's property. Strange to say, most of the blame was not chargeable in this case to the coke-oven superintendent.

Too Much Rash Made Spongy Coke

It was found that the coal, as charged to the ovens, contained a large amount of rash and "mother coal," and these impurities did not unite with the rest of the charge to form a firm coke, but produced instead spongy masses that were easily broken up into small pieces of breeze. These inferior masses of coke were very noticeable around the door jambs of the ovens. The mine superintendent tried to lay the blame on his washer man, but it was found that the washer would not eliminate a large percentage of the impurities.

Rules were then adopted, putting it up to the mines to leave these impurities underground. Of course, it is not possible to depend upon miners to load absolutely clean coal, but enough improvement was accomplished to make a marked difference in the quality of the coke.

After the blast-furnace management became satisfied with the quality of the coke, the company auditor began to ask curious questions about the cost thereof.

High cost of coke may be chargeable to several different conditions, but generally, low yield is the governing factor.

Charles Catlett contributed an excellent paper to the American Institute of Mining Engineers, at the New Haven meeting, in October, 1902, which covers the question of yield very fully, and Newell G. Alford, in his paper in Coal Age, of June 7, 1913, also brings out several points bearing on this phase of coke making, but in this particular instance, the high cost was simply a book-keeper's cost. It was found, after careful investigation, that the ovens were being charged with very wet coal (13 per cent.), while only 4 per cent. was being allowed for moisture content. This shifting of the figures did not help the final cost of coke, as chargeable to the furnace, but it put the blame where it belonged.

Loading Coke Into Cars with Automatic Shovel

Occasionally differences arise between the coke-oven and the blast-furnace men, as to what constitutes best practice. For instance; some furnace men prefer 72-hr. coke, while others prefer 48-hr. Now it is quite possible that while the furnace man prefers the 72-hr. coke, the superintendent of the ovens might find it more economical to produce 48-hr. coke.

Again, the blast-furnace man will always contend for the lowest possible limit to ash in coke, because every per cent. of ash that he succeeds in eliminating from the

fuel, cuts down his cost on pig iron approximately 25c. per ton. But it is possible to overdo this. Sometimes it is better to leave a little more ash in the washed coal rather than introduce an undue waste, in an effort to obtain too low an ash in the washed product.

When one company controls the mines, ovens and furnace, it is easy to arrive at the most economical basis for the handling of the combined operation, and it is then simply a question of "laying down the law" to the various operating heads, but, under different conditions there will always be more or less wrangling. All parties cannot be satisfied.

From the standpoint of the coking superintendent, the question of uniform operations and output is of supreme importance, yet he can get little sympathy from the blast-furnace man in this matter. When the blast furnace begins to "act up," and refuses to take its burden, it is much easier to stop the supply of raw material at its source than to begin work on the stock piles and the coke-oven men receive orders over night to bank ovens.

This constant banking and starting adds a considerable amount to the cost sheets of many coking operators, besides affecting quality by increasing ash in the product. At times the delays call for more than "banking," and in that case the expense of firing up the ovens brings about even more serious additions to the cost sheet.

Rules for Good Results in Firing Up

There are several different methods of firing up ovens. The following instructions, written out a number of years ago, have always been found to give good results:

Preparation—Have all wood and kindling in place on yard. Begin at midnight to put fire in the ovens.

Method—Put up half door, leave hole in bottom about 6 in. square. Put in two ties as a sort of flue, extending on the bottom of the oven toward trunnel head. Build fire opposite hole in door and between ties, using plenty of kindling, enough to fire coke. Use plenty of coke, a cart-load or two (black jack will answer), placing just inside of door, on top of kindling.

When coke is well caught up, which may take four or five hours, charge with 5½ tons of coal. Level this and then put in all the old ties or other wood you can get in at the door. Put up the door, sealing it tight where you usually draft, but leave two holes level with the top of coal in the ovens. This will give a draft at bottom for the kindling and coke and a draft higher up for the ties after ignition. There should be a competent man to keep these holes cleared out as ashes form.

When the coal has fired as it should and it is considered safe to do so, seal the three holes and draft at top of door, only the latter must be much lighter than usually given to ovens in service. Someone used to drafting and with some judgment is needed here. Many of these ovens, nearly all of them, will burn in all right, giving no more trouble and making good coke, but some will need the crust broken and other attention. We usually blame this on the man looking after the ovens, but the truth is that some ovens will do well and others the reverse.

Even Loading May Become a Bone of Contention

Determining the best method for loading coke from beehive ovens presents another problem for the coke-oven superintendent and in this he again comes in conflict with the blast-furnace manager.

There are two things to be considered—labor and waste.

The four photographs show four different ways of accomplishing this work. The old original method of hand forking and throwing each forkful up over the side of the car, probably yields the best results considered from the viewpoint of the blast-furnace man, as it gives him clean coke almost free from breeze.

But this method is far from satisfactory to the coke-oven operator. It introduces an acute labor problem since it is becoming more difficult each year to keep a complement of coke pullers, and furthermore the waste of fine coke with the breeze is always noticeable.

The photograph showing the runway suggests a method that overcomes, to an extent, the shortage of labor, as one good coke puller can use two ordinary laborers to wheel up the coke and thus accomplish as much as three trained men. This method also reduces the loss of fine material

A Modern Coke-Loading Machine at an Alabama Plant

and breeze, as the coke can be dragged directly from the oven door into the iron wheelbarrow, thus avoiding one handling. Here again the blast-furnace manager will register a kick if the men are not closely watched to prevent ashes and breeze being loaded.

One runway will serve seven ovens. The top of platform is so arranged that the wheelbarrow will dump over the top of car sides without an effort on the part of the laborer.

This brings us to a consideration of the third party—the coal-mine superintendent.

A Runway Can Be Made to Serve Seven Ovens. This Effects a Considerable Saving in Labor

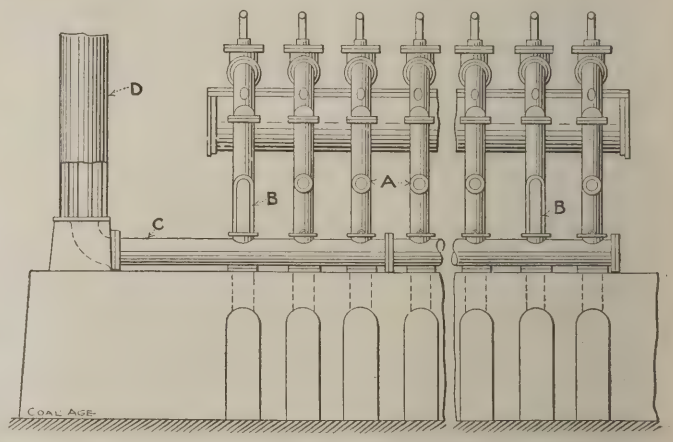
As a rule, the coal-mine superintendent gets little credit for improvement in coke, and yet the quality is almost entirely dependent upon his product. The only possible way to keep peace between the coal man and the coke man, is to eliminate all guesswork in computing their weights and then base price entirely upon quality of coal delivered.

Where one company operates both the ovens and the mines, the mine official should be given his share of the credit whenever quality of coke is improved.

The Ohio Labor Situation

Nothing has been accomplished towards negotiating a wage scale for Ohio mines. Conferences between operators and miners started June 23 and lasted for the greater part of last week. After failing to reach an agreement, operators from Eastern Ohio and Cambridge withdrew, saying that it was useless to confer longer. The best that the eastern operators would offer was 41.12c., and this the miners refused point-blank to accept.

After their withdrawal, operators and miners of the Hocking Valley, Jackson, Crooksville, Pomeroy Bend and a part of the Bergholz districts resumed negotiations. The operators, after a general meeting, offered a scale of 44.61c. for machine-mined coal on the mine-run basis. This was made in the form of an ultimatum and was refused by the miners. The final conference for the week was held June 27, and an adjournment *sine die* was taken.



Senator William Green, author of the mine-run law, hearing of the adjournment, rushed to the meeting and succeeded in having that action rescinded and an adjournment until 10 a.m. June 30 was taken.

Operators in every section of the state have little hopes for an early adjustment of the wage question. The miners' officials have a firm hold on the rank and file, and, despite certain dissatisfaction, are holding them in line. It will probably be necessary to have another general miners' meeting before a less scale than 49.64c. will be accepted by the miners.

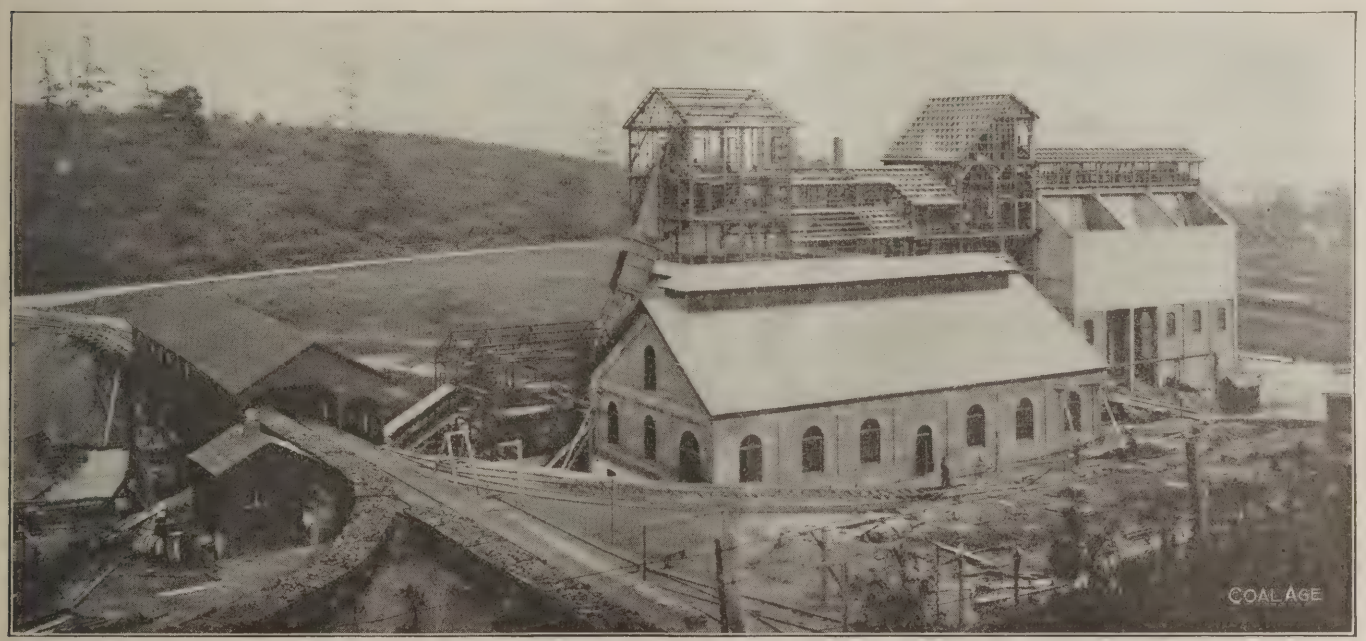
Device for Rendering Coke Oven Gases Harmless*

At the Colonial shaft of the Mansfield mine in Langendreer, Germany, experiments have been made with a process for rendering harmless the vapors and gases escaping from byproduct coke ovens when they are charged. Since the results of the trials have been good in every respect, the works management has arranged for the installation of this device for a group of fifty ovens.

As shown by the accompanying figure, the riser pipes are each provided with a branch, *A*, which, whenever the several chambers are to be charged, is put in communication, through a sheet-metal bend *B*, with the horizontal conduit *C* over the ovens. This conduit ends in a furnace *D*, about 30 ft. high, in which the vapors and gases, as they pass through, inflame and are consumed. The draft caused by the high temperature is so strong that gases are sucked in from a distance of about 170 feet.

Sketch of the Waste-Gas Consumer

Electrification of the Bearcreek Coal Field in Montana—One of the most important new deals just consummated is the entry of the Montana Power Co. into the Bearcreek coal field in the southeastern part of the state, to supply the mines and towns with electric power and light. This is one of the leading coal fields in Montana. The coal mines at Sand Coulee and Stockett, a few miles from Great Falls, have for some time found it cheaper to buy hydro-electric power than to utilize their own boilers and coal for steam, but the Bearcreek district is the first instance in the history of the world where electric power has been shipped any considerable distance to supplant steam power at coal mines themselves. The Bearcreek field is being reached from Billings by a 60-mile line, which will tap Joliet, Fromberg, Bridge and Bearcreek. The power will come chiefly from the new Great Falls plant, some 300 miles distant. It is expected that 4000 to 5000 hp. will be consumed in the Bearcreek district by 1915, netting the Montana Power Co. approximately $100,000 per year.—"Boston News Bureau."



*Translated from "Glückauf."

The Huron Plant of The Keystone Coal Company

By Edward Colston Taylor*

SYNOPSIS—The efficiency of the Huron washery plant is exhibited in the excellence of its washing, in the small number of men employed, in its freedom from breakdowns and the speed with which such difficulties are corrected. In regard to the former, which the author does not treat, it said that less than 4 per cent. of what should be re-wash coal, as determined by the float-and-sink test, finds its way to the refuse pile. Three men run the washer and rewashers which handle 150 tons of coal per hour and 13 men operate 100 Belgian ovens. Three men take care of the boiler house, the ashes being removed by flushing with water.

The Huron plant of the Keystone Coal & Coke Co. is situated on the Alexandria Branch of the Pennsylvania R.R. The shipping point is Dundale, and the post office New Alexandria, Penn.

View of Plant as Seen from Above the Drift Mouth

The coal seam is the Pittsburgh, with an average height of 7 ft. 2 in. This is a good steam coal and burns into excellent coke.

The washery and coking plant were put into operation in 1910 and have been in continuous service ever since; the coke commanding a ready market even in dull times. Beside furnishing washed coal for the ovens, the washery prepares fuel which is shipped for use in byproduct ovens and for smithing purposes.

The original mine opening was made in 1899 by the Huron Coal Co., which built the present tipple and dwelling houses, but shipped only run-of-mine coal. In 1907 the Keystone Coal & Coke Co. acquired the property and immediately began to plan for the erection of a washery and coke ovens.

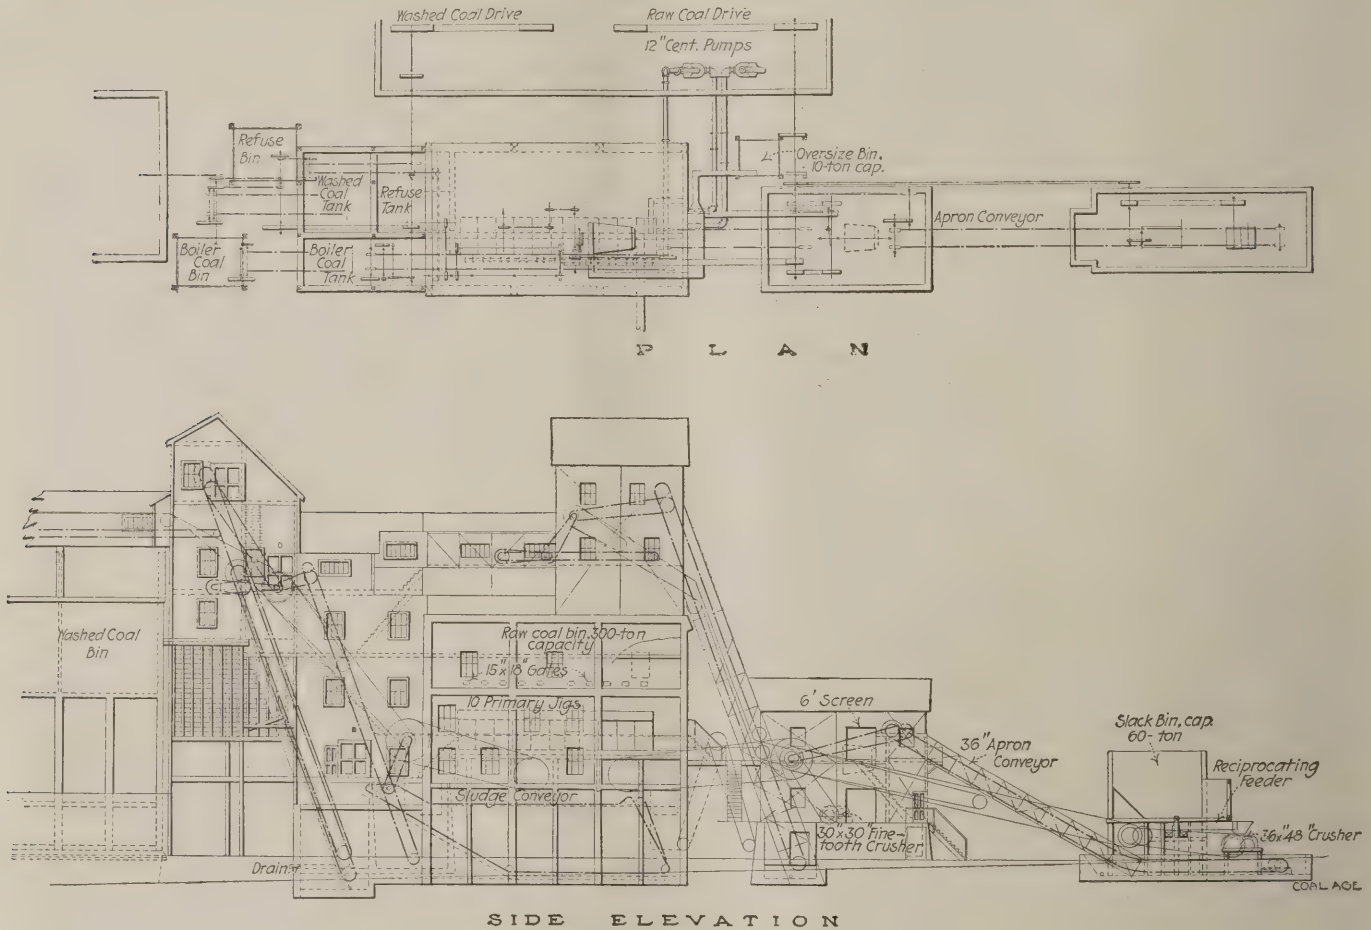
*Superintendent, Keystone Coal & Coke Co., New Alexandria, Penn.

Two Plants with a Single Supply House

The workings and plant being adjacent to the Salem mine of the same company, the two plants were put under the same management, so that full advantage could be taken of the experience gained at Salem in washing and coking this coal and in the handling of such equipment as the management intended to use at both operations. Salem being equipped with a complete machine shop and an efficient supply warehouse and storage yard, there was no necessity of duplicating this equipment at the proposed workings. The same office force by the addition of one man handles the mine records for the two places.

From the autumn of 1907 until the autumn of 1909 nothing in the way of construction was attempted. During this time the management gave close attention to the operation of the Salem plant with a view of determining any changes which might be desirable in designing the new plant, in visiting other plants in this and other fields and in working out tentative plans. The information thus acquired was of inestimable value in working out the design.

It was the desire of the management if possible to produce a plant which would be a model of efficiency and at the same time which embodied no radical departures from conservative engineering. They desired to depend on the careful working out of details along well established lines.

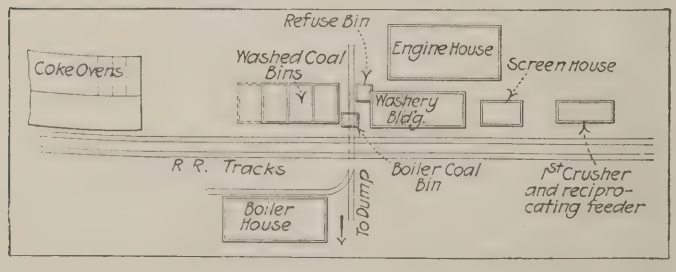


Eliminating and Anticipating Breakdowns

All buildings are well lighted and ventilated. Especial attention was paid to insure the accessibility of all machinery for repairs and to insure the comfort and convenience of all workmen. All machinery was designed

just large enough to insure the longest possible life in performing a given amount of work.

In the washery, stairs of easy slope are provided and safe-guarded by substantial railings. Windows are so arranged that there are no dark corners in the whole structure. The building is heated throughout with steam.



All the heavier machinery is provided with special breaking pins which are easily replaced and thus many disastrous wrecks are avoided. All elevating and conveying machinery is large and heavy, so as to be slow moving for a given capacity. Where any two or more like pieces of machinery were required of nearly equal capacity,

General Plan and Section Elevation of the Huron Washery

Every floor is provided with water lines for fire protection and for convenience in washing out the building.

All dusty places are sealed off, but at the same time left light and roomy so that in case of making repairs there are no casings to tear out nor close places in which to work. Around the heads of all elevators ample space is provided, the flooring around these places being sufficiently heavy to bear the weight of any repair parts. Care is also taken to provide ample light in such places and beams are projected from the building above every part which may need replacing, so that the heaviest machinery may be lowered, and repair parts hoisted into place in a few minutes.

General Plan of Plant

units of the same size were chosen so that the equipment is standardized and fewer repair parts need be carried in stock.

A Three-Man Washery Plant

The benefit derived from this careful and generous design has been marked. The washery easily has a capacity of 150 tons per hour. The washery proper is operated by two men, one man on the jigs and one man for oiling and general inspection of machinery. The only other man connected with the direct operation of the washery is under the tipple; he attends to the crushing and screening plant.

Although a complete stock of repair parts is provided, few replacements have been necessary. The machinery was furnished and the washery erected by the Link-Belt Co.

The raw coal is crushed so that the largest size passes through 1¼-in. round perforations. It is then elevated to a 300-ton capacity reinforced-concrete storage bin, which is a part of the washery building. From this bin the coal is fed into a battery of 10 jigs by means of revolving feeders. The washed coal is sluiced into a large elevator boot. The water from this boot is drawn off in a

thin stream, every effort being made to insure settling. Though 150 tons of coal per hour is taken out of this boot, 12,000 gal. of water are drawn off in the same time with the loss of only such material as will pass through a 60-mesh screen.

The Inferior Coal Is Saved for the Boilers

The primary refuse, consisting of 10 per cent. of the product, is sluiced to two rewashing jigs, which take out about half of the material for plant fuel and throw one-half into the final refuse elevator boot. The water from the boots of the elevators which lift refuse and washed coal, respectively, is sluiced into a large settling tank provided with a slowly moving scraper, which recovers the sludge below 60-mesh and places it in an elevator boot, where it is mixed with the best product from the rewashing jigs, and thence is elevated and sent to the boiler house for fuel.

The water is circulated by means of a centrifugal pump furnished by the Blackall & Baldwin Co. This pump is set in the cellar of the main engine house. The washed coal is stored in reinforced-concrete bins divided into six compartments, each of 200 tons capacity. Thence it can be run into the charging larry for the ovens or direct into railroad cars for shipment.

Almost Entirely of Fireproof Construction

In the construction of the washery building, various materials were used to meet each special condition. In the dry coal or preparatory end, structural steel was used set on heavy concrete foundations, this being advisable on account of the rapidly moving machinery. In the central portion of the building, where are located the settling tanks of concrete and the jigs and the raw-coal storage bin, reinforced concrete was used.

The wet-coal elevator towers are of yellow pine and made a part of the main building. The reinforced concrete was erected by the Baltimore-Ferro Concrete Co. The structural steel and frame part of the building is covered with Asbestos Protected Metal, as is also the roof.

The original tipple was left standing unchanged except for the additional bins and the crushing and conveying machinery for handling the washery coal. It is of frame construction, equipped with a Phillips cross-over dump. The mine cars which hold 1½ tons are fed to the dump by gravity and the empties run away in the same manner.

The coal is hauled outside by one 15-ton and one 10-ton General Electric locomotive. Six men and boys man the tipple.

Boiler-House Economies and Appliances

The boiler house is of brick with steel roof trusses, the roof covering being asbestos protected metal. The equipment of the boiler house consists of two 300-hp., class E Stirling boilers, equipped with McClave shaker grates and Argand blowers. The boiler house is set in a hollow across the railroad tracks from the other buildings of the plant. This was done so that the fuel could be delivered in mine cars or in special dump cars from the washer at sufficient height to allow of ample storage and so that the wet washery fuel may have steep slopes to slide on.

The Huron Power House, Washery, Boiler House and Coke Ovens in Process of Construction. The Tipple Is Seen on Left in the Rear

Advantage was taken of a small stream in the hollow, the water from which is passed under the boilers. Aided by some fresh water it flushes the ashes away without handling. The feed pumps and feed-water heater are set in a wing of the boiler house sealed off from the main building. There are two single-plunger Yough feed pumps, 16x8x18 in., one of which is held in reserve. The heater is set high above the pumps and is of open type 1200 hp., and was furnished by the Platt Iron Works.

In this room is also set a small Ingersoll-Sergeant air compressor, which operates a Lagonda boiler-flue cleaner. The water forms a scale so that it is economical to clean boilers about once every six weeks. The fuel from the washer is sufficient to supply requirements at all times, no run-of-mine coal being used. Two firemen in daylight and one at night man the boiler house. Space is provided for two additional boilers.

Engine House

The engine house is set parallel and adjacent to the washery and is of brick with steel roof trusses, covered with slate. In this building is located one 150-hp., 250-volt Westinghouse direct-current generator, which furnishes all power for mine and coke yard. Two 200-hp. Erie City twin engines drive separately by means of rope transmission and shafts through the washery building the dry coal or preparatory machinery and the wet coal or actual washing equipment. The engine, which drives the washing machinery, also drives the circulating pump mentioned above. There is space in this building for two additional generators Thus practically all the power for the plant is developed in the one building and is tended by one man. When the generator has to be run at night the plant watchman attends it.

Repair Shop

The carpenter and blacksmith shop is the original frame building, equipped with a 7½-hp. motor and light shafting for small drills, saws, etc. The repair men are in charge of the master mechanic and consist of one machinist, three carpenters and a blacksmith and helper. A considerable part of these men's time is taken up in filling temporary vacancies of regular men in other parts of the work. The carpenters are also used at the Salem plant in emergencies.

Belgian Ovens Discharged and Coke Loaded by Machinery

The coking plant consists of 100 Belgian ovens, 5 ft. wide by 34 ft. long and 8 ft. high at the crown. The brick for these ovens were furnished by the Harbison-Walker Refractories Co. The frames of the doors are of cast iron and are lined with firebrick furnished by Hay & Rule. The charging larry was supplied by the Phillips Mine & Mill Supply Co., and was specially designed for the safety and convenience of the charger. The coke is watered by a machine, designed and built at the plant. This machine quenches 50 ovens in 8 hours with one attendant.

The coal charged in an oven is leveled by a machine in 2 min.; the ram pushes out a charge of coke in 1½ min. A pan is set at the opposite end of the oven to receive the charge of coke. This pan is provided with a screen set 12 in. off the bottom, which allows the ashes and breeze to drop through. A gantry crane picks up the pan and dumps the contents into the railroad cars. After every fourth oven, the ashes are dumped into mine cars running on a track on the yard.

Thirteen Men Run One Hundred Ovens

The leveler, pusher and loader were furnished by the Alliance Machine Co. When fully manned, this machinery is capable of handling 100 ovens per day, or an average of 600 tons. There being at present only 100 ovens, or 50 to draw each day, the labor force had to be arranged so that the men double up on machines. The man who runs the crane also runs the larry; one man runs both the leveler and the ram. In this way the labor cost is low. The total force consists of 13 men, including the foreman, a coke burner, a mason and an attendant.

Water is supplied from a large reservoir 5 miles away, the storage capacity of which is 300,000,000 gal. The water flows by gravity to the Salem plant and is pumped thence to storage tanks above Huron.

Float Demonstrating Washer Constructed for Greensburg Centenary

New Coaling Equipment on the Great Lakes—The formal opening of the $2,000,000 docks and terminals of the Hocking Valley R.R. is scheduled for July 1. The docks are built entirely of concrete and have the largest coal and ore handling equipment at this end of the lakes. With the opening of the docks, the Hocking Valley will have many times its present coal and ore handling capacity. It will therefore be prepared to meet the increased coal tonnage when the Chesapeake & Ohio builds its proposed line from Portsmouth to Columbus, thus giving it the shortest route from the coal fields of West Virginia and Kentucky to Toledo.

The proposed new route of the C. & O. will parallel the tracks of the Norfolk & Western but according to the published announcement the former will not compete for the local traffic, the extension being used only for through traffic. When the new docks are opened the Pennsylvania will take over the dock machinery and other equipment on lower Summit St., heretofore used jointly by the two roads. The new terminals and docks of the Pennsylvania Co., at Sandusky are expected to be ready for use by July 15. A force of 400 men are now busily at work on these improvements. In making room for the new tracks it was necessary to make a fill nearly a half mile long and 20 ft. deep. Seven tracks are being laid to the new loading machine, five for loaded cars and two for empties. All the time the work of improvement has been going on the docks have been used to their full capacity. When the new docks are completed the capacity will be trebled. The present dumping machine has a capacity of a car every three minutes while the new one will handle a car every minute and a half, the two machines taking a car a minute or a train of 60 cars every hour.

The opening of the new Wheeling ore hoists at Huron has been delayed because of defective parts found in the machinery. Under hydraulic pressure, defects, due to sandholes in the casting developed and it was necessary to dismantle part of the structure and the new parts are now being awaited.

Development and Present Status of Byproduct Coking in the U. S.

By W. H. Blauvelt*

SYNOPSIS—Byproduct coke is forging rapidly to the head, the production more than doubling during the interval from 1909 to 1913. Some of the enormous losses incident to beehive practice. Popular misconceptions regarding the high first cost of the byproduct ovens, and inferior quality of the product. American practice excels European.

The first byproduct coke in America was pushed from a plant of 12 Semet-Solvay ovens in Syracuse, N. Y., in December 1892, and the following year 12,850 tons of coke were produced. The following table shows the growth of the industry since that time in short tons:

Year	Beehive Coke	Byproduct Coke, Short Tons	Byproduct Coke, % of Total
1893.....	9,464,730	12,850	0.14
1901.....	20,615,983	1,179,900	5.41
1907.....	35,171,665	5,607,899	13.75
1908.....	21,832,292	4,201,p26	16.14
1909.....	33,060,421	6,254,644	15.91
1910.....	34,570,076	7,138,734	17.12
1911.....	27,703,644	7,847,845	22.07
1912.....	32,868,435	11,115,164	25.27
1913.....	33,596,669	12,714,700	27.45

The tonnage of byproduct coke produced in 1913 is over twice that for 1909. On the other hand, the production of beehive coke in 1913 was exceeded in the years 1907 and 1910.

Losses Incurred in the Beehive Oven

The waste of coal in the manufacture of coke has long been a reproach to this country, as compared with some of the European countries, and long after Germany had practically forgotten the wasteful beehive oven, a large percentage of the coke made in the United States has been produced by that process. Not only does the beehive oven destroy all the byproducts, gas, tar, ammonia, etc., but it also produces a smaller yield of coke.

Taking the average value per ton of the coal coked in the beehive oven, as given by the United States Geological Survey for the year 1912, $1.01 per ton, the loss of coal values that may said to have been destroyed in the beehive oven during the six years ending with 1912 amounted to $42,110,000. Using the United States Geological Survey figures again for the value of the byproducts, the total return from the byproducts that would have been recovered if this coke had been made in byproduct instead of beehive ovens, would have been $266,700,000. This makes a total waste in the six years of $308,810,000, or an average waste per year of over $50,000,000 of the country's mineral wealth. This enormous waste is a most serious matter from the point of view of the conservation of our country's resources, yet it is gratifying to note the rapidly increasing percentage of coke produced in the byproduct oven, so that this economic loss bids fair to be eliminated before many years.

To an owner of deposits of coking coal it is interesting to note the Geological Survey's statement that the average yield of coke from coal in byproduct ovens in 1912 was 74.9 per cent. and in beehive ovens 64.7 per cent., a difference in favor of the byproduct ovens of 10.6 points, or 16.4 per cent. In the coking of low volatile coals, such as those obtained from the Pocahontas field, this difference is even greater. The actual yields of coke from Pocahontas coal in the beehive oven are usually not over 60 per cent., while in the byproduct oven the yield is 80 per cent. or more. This means that any given acreage of coking coal of this quality will yield one-third more coke if byproduct ovens are substituted for beehives; or, if a given acreage will supply a blast furnace with coke from beehive ovens for 20 years, the substitution of byproduct ovens will add 6⅔ years to the life of the acreage.

Cost of the Byproduct Oven

It has been the general impression in many places that byproduct plants are very costly. A high authority, familiar with both beehive- and byproduct-oven practice, has worked out the following comparison from a careful analysis of many installations. In a coking field like the Connellsville, or other fields where the coal is well adapted to beehive oven conditions, the cost of a complete plant of beehive ovens, including all the accessories of railroad sidings, water supply, workmen's houses, etc., would be somewhat less than the cost of a byproduct-oven plant correspondingly equipped. In the Pocahontas district, on the other hand, where the coking process in the beehive oven is more wasteful, the byproduct plant can be installed at a smaller cost than the beehive.

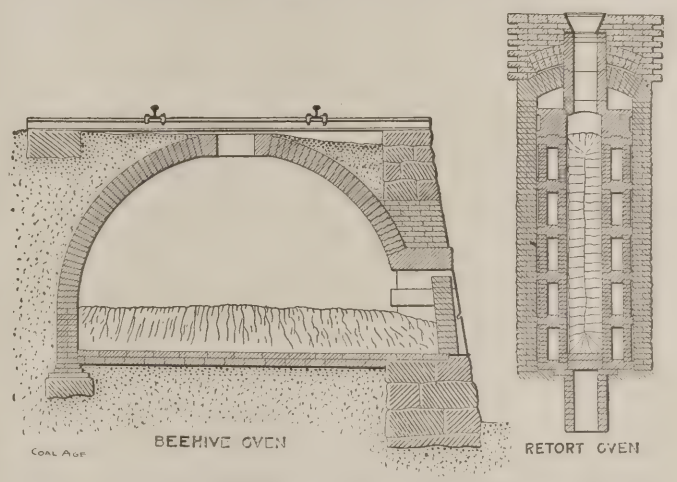

Fig. 1. Coke Structure in the Beehive and Retort Oven

There are now between 40 and 45 plants of byproduct ovens in the United States. In almost every case these plants are located at the point of consumption of the coke, rather than at the coal mines, as distinguished from the almost universal practice with regard to beehive plants. This fact, together with the very general practice in byproduct ovens of mixing two or more coals for the purpose of making a better quality of coke than could be made from either of the coals alone, has made available for coking purposes many coal deposits which could not otherwise have been utilized. As a result, many coal deposits are now recognized as yielding excellent coking coal which were formerly not so rated.

*Consulting engineer, Semet-Solvay Co., Syracuse, N. Y.

A Comparison of Byproduct and Beehive Cokes

The process of coking coal in beehive and byproduct ovens differs in one essential particular. The beehive oven is a circular chamber with a dome-shaped top, which gives the oven its name; it is usually about 12 ft. in diameter and 6 ft. high. The coal is charged into the oven through a hole in the top and levelled off into a layer about 30 in. deep. The coal is fired from the heat remaining in the walls from the previous charge, air being admitted through a side door, and the coking of the coal is effected by the combustion of the volatile matter with a partial consumption of the fixed carbon. The combustion is regulated by the amount of air admitted at the door and all of the volatile matter is consumed in the process, see Fig. 1.

The outside quenching removes the carbon glaze, familiar to all users of beehive coke, and in the early days the absence of this was counted a great objection to byproduct coke. This objection is no longer raised, and a prominent authority in blast-furnace work has recently published a statement that "today byproduct coke, which surpasses in quality most of our beehive product, and rivals the best, is made at several American plants." In the foundry trade byproduct coke has won an enviable position, and hundreds of thousands of tons of it are now being sold annually at a premium of from 50c. to 75c. above the standard grades of beehive coke.

Requirements of Good Coke and Difference in the Byproduct and Beehive Products

The development of the best cell structure is of the highest importance in the production of the best metallurgical coke. A well developed cell structure presents a large surface to the air, producing rapid combustion, while a strong cell wall prevents crushing and maintains an open fuel bed. Moreover, the relation of cell wall to cell space must be properly developed, in order that when the coke reaches the furnace tuyeres it can be attacked promptly by the oxygen in the air, with resulting rapid and intense combustion. A soft thick cell wall is objectional in blast-furnace coke, since it permits the oxidizing action of CO_2 gases in the upper part of the furnace by which the coke is wasted and the furnace top temperature increased.

But in foundry work it is more desirable to have a coke with a softer cell wall, smaller cell space, and a strong, tough structure. This permits the air to burn the coke immediately to carbon dioxide, with the production of the highest temperature in the melting zone of the cupola, and the weight of the charge is easily supported. This present practice seems to indicate that somewhat different treatments are required for producing the coke best suited to furnace and foundry practice.

The essential differences in the appearance of byproduct and beehive coke are first, the duller appearance of the former, on account of its being quenched outside of the oven, and second, the byproduct coke is produced in shorter, blockier pieces, as compared with the long finger-like pieces typical of the beehive coke. This difference is due to the method of applying the heat in the different types of ovens, see Fig. 1. In the beehive oven, the coking process works from the top downward, so that sometimes pieces are produced equal in length to the full depth of the charge. In the byproduct oven the coking process starts from both sides of the chamber, which averages from 18 to 20 in. wide, and proceeds toward the middle, so that the pieces will always be somewhat shorter than half the width of the oven.

It is natural that in the 21 years, during which the byproduct oven has been developed in this country, many improvements have been made, and in some respects, American practice has advanced beyond the latest progress in Europe. One of the most notable improvements has been the increase in the output per oven unit and per man employed. When the first ovens were brought over from Europe they had a capacity of 4.4 tons of coal per day, and one crew of of men was capable of handling about 25 ovens. This gave a capacity of 110 tons of coal per day with a unit crew. Today the most modern ovens have a capacity of 20 tons of coal per day, and improved organization and modern machinery permit practically the same crew to handle from 50 to 60 of these ovens, thereby coking from 1000 to 1200 tons, instead of the original 110 tons.

The use of silica material in all portions of the oven structure subjected to high temperatures has also brought improved results, as compared with European practice. The European brick makers have not as yet successfully adapted silica material to oven construction. The higher refractoriness and greater conductivity of silica has been one of the important factors in the larger output of the American oven, and the abiltiy to maintain higher coking temperatures has been a material help in developing the best coke structure from the various coals employed. The modern American oven cokes from one-third to one-half faster than ordinary European practice, and as stated above, the improvement in the quality of the coke from the American furnace man's point of view is quite as important as the larger output by the shortened coking time.

The Modern American Byproduct Oven

A typical modern byproduct oven is illustrated in Fig. 2. Each oven is equipped with a pair of regenerators which preheat the air to about 1100 deg. C. Since the oven gas used for heating carries from 500 to 600 B.t.u. per ft., the temperatures in the heating flues can be maintained quite as high as even the refractory silica brick can stand. The gas is admitted at several points in the series of flues, and by this means, it is possible to maintain the entire surface of the oven walls at a uniform and high temperature.

To control the temperature in all parts of the oven is of the greatest importance since any comparatively cool spots delay the operation, and part of the coal is overcoked, while the cooler portions are finishing their work. The operation of the regenerator is, in general similar to that of an open-hearth furnace except that an entire block of 60 or more ovens is reversed at one operation by means of reversing dampers arranged at the end of the block. The air enters at the bottom of the regenerator, rises and passes through the flue system, meeting the gas at the several burners arranged at the ends of the combustion flues. On reversal the air enters the other regenerator, rises through the air flue, shown in dotted lines at the left of the illustration, and descends through the horizontal combustion flues, meeting the gas as before. The products of combustion pass out through the other regenerator to the reversing damper and the stack

in the usual manner. By this system the entire series of combustion flues is swept by all of the air required for combustion, as well as by the products of the burning gas, so that hot spots are prevented, and a uniform temperature is maintained throughout.

Fig. 2 also shows the charging car on top of the oven with openings for delivering the coal into the oven, and at the left an opening providing for carrying away the gases to the apparatus for recovering the byproducts. On the left is shown the head of the pusher for discharging the coke, and on the right the car standing ready to receive the coke as it is pushed out, and in which the coke is quenched.

Recovery of the Byproducts

The byproducts recovered from the coking of coal in a byproduct oven consist mainly of ammonia, tar, benzol and gas. When the gases are driven off from the coal by the heat of the oven they are usually cooled and then scrubbed in a suitable apparatus. The cooling takes out the water vapor, together with part of the ammonia and most of the tar. This cooling is usually done in large cylindrical vessels where water is used as the cooling agent, either passing through tubes arranged like a vertical boiler, or the water is showered over a series of grids in direct contact with the gas.

The scrubbing of the gas is effected in similar vessels arranged in series. As water has a strong affinity for ammonia, it is a very effective scrubbing agent. In this method the ammonia is recovered in the form of a weak impure solution of ammonia and water, the ammonia averaging about 1 per cent. This weak ammonia liquor is then distilled with steam, and purified and condensed into the ammonia of commerce, or else the ammonia gas from the stills is passed through sulphuric acid to form sulphate of ammonia, largely used in the manufacture of fertilizers. The tar is separated from the weak ammonia liquor by gravity, and is then ready for shipment or for distillation into pitch and tar oils.

In some of the latest byproduct oven plants the ammonia is recovered by what is known as the direct process. In this process the tar is first removed either by cooling the gas or by a scrubbing process, and the tar-freed heated gas, is passed through large vessels so arranged that the gas is forced through sulphuric acid, thereby removing the ammonia, with the direct formation of sulphate of ammonia. In this process it is essential that the tar be removed as thoroughly as possible, in order that the quality of the sulphate of ammonia may not be contaminated by the tar. After the tar and ammonia have been removed the benzol products are recovered by passing the gas in intimate contact with the heavy oil, which absorbs the benzols. The gas is then ready for use as a fuel, or in gas engines. In case the gas is to be sold for illuminating purposes the benzol is not removed. The utilization of coke-oven gas for illuminating purposes has developed much farther in America than in Europe. Several important cities use coke-oven gas as their only supply, while in a number of others it forms an important portion of the gas supply. From 50,000,000 to 60,000,000 ft. of oven-gas per day is sold for illuminating purposes in the United States.

Production and Marketing of the Benzol Products

In the recovery of the benzols, these products are removed from the heavy scrubbing oil described above, by distillation with steam, and are then separated by a fractionating process and purified. The benzol products are used largely in Europe for making dyes, and latterly also for motor fuel in place of gasoline. A recent British publication contained a list of over 400 towns and villages in the United Kingdom in which supplies of motor benzol can now be obtained. In America benzol products are only used to a small extent for motor fuel, but where used they have been very satisfactory, as they are more efficient than gasoline. With the rapidly growing demand for motor fuel, benzols promise to become an important factor in this trade.

The pure benzol products as produced from coke-oven gas are benzol, toluol, xylol and solvent naphtha, all of which have important uses in the arts. Owing largely to tariff conditions, the manufacture of chemical products from the benzols has not been developed to any important extent in America. The policy of taxing intermediate

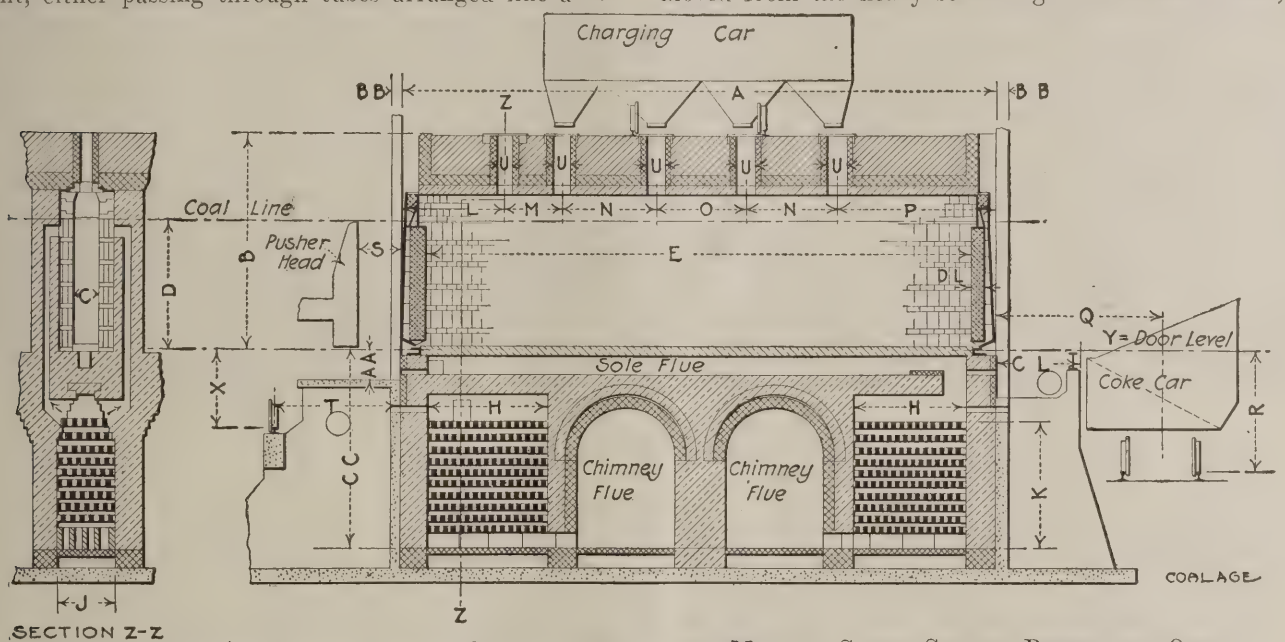

Fig. 2. End and Longitudinal Elevations of the Modern Semet-Solvay Byproduct Oven

products, while having the finished products, on which much labor has been expended, admitted free, has produced a condition which does not encourage the chemical manufacturers to invest in the necessary plants for this class of product.

The operation of the byproduct oven calls for a high grade of technical skill and a combination of mechanical, metallurgical and chemical engineering. But the advance from the old beehive process is in accord with the progress that has been made in other technical industries, and in the conservation of our natural resources the byproduct oven has a place which is surpassed by few of our manufacturing processes and presents still further possibilities along this line.

Some Types of Coke Oven Doors

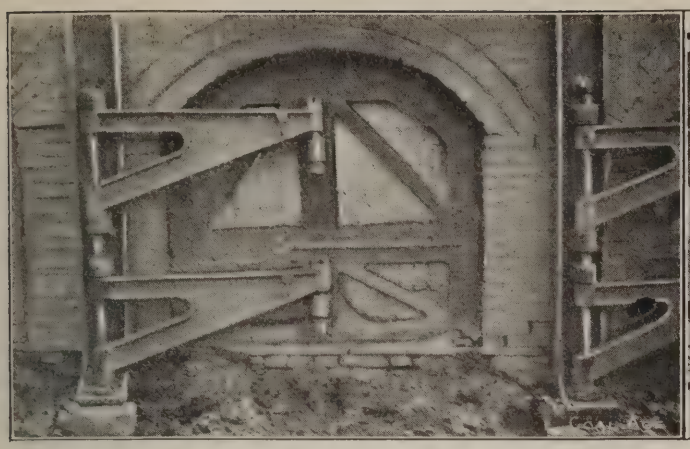
SYNOPSIS—The large doors of the rectangular (Mitchell or Belgian type) oven are expensive to brick up. Doors mudded around the edges have replaced them, but the life of these stoppings was at first short. This article describes the steps taken to make this necessary accessory as durable as the lining of the oven. The new asbestos-clay daub for oven doors is described.

The square of the beehive-oven door measured about 2 ft. 9 in. by 2 ft. 9 in. Above this square was a low arch with a spring of 9 in. Thus roughly about 9 sq.ft. had to be bricked up or mudded every time a charge was coked at suitable periods during the progress of burning.

THE OVEN DOORS AT THE ACME PLANT, NEAR BENTLEYVILLE, PENN.

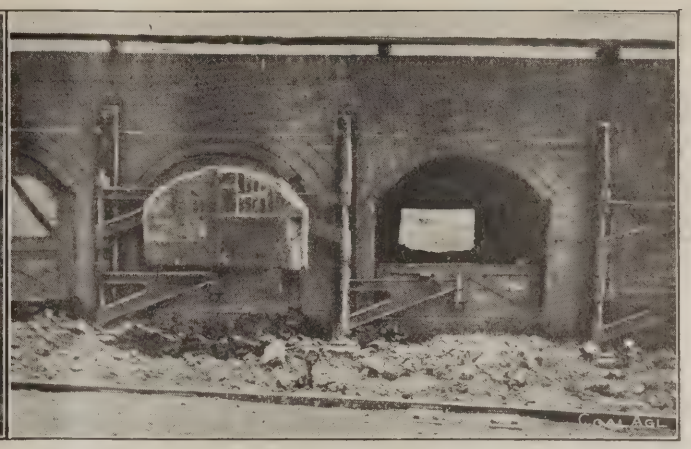
The introduction of the Mitchell or Belgian ovens, in which there are two doors, and each of these is merely one end of the oven and has dimensions equal to those of the oven cross-section, made the cost of building doors an item of much interest. The Mitchell oven was adopted by those people who were looking for decreased cost of production and they naturally viewed the two large doors with great disfavor.

THE DOOR BUILDING OF THE MITCHELL OVEN COST FOUR TIMES THAT OF THE BEEHIVE



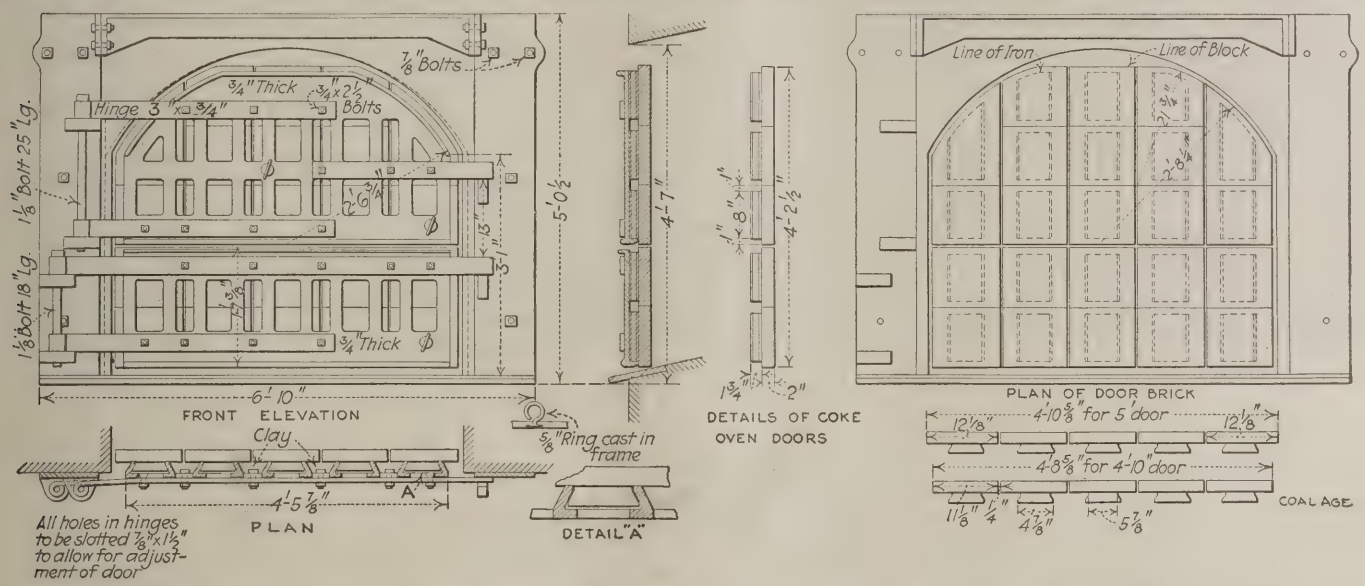
For instance, the door openings at the Acme No. 2 plant of the Pittsburgh-Westmoreland Coal Co., Bentleyville, Penn., illustrated herewith, are 4 ft. 10 in. to 5 ft. wide and at the top of the arch are 4 ft. 7 in. high. Thus 42 sq.ft. of opening approximately has to be filled and torn down with each recharging. It has been estimated that the cost of this work, including the mixing of the clay and coke breeze for making the door airtight, would be about 50c. per oven. However, whatever may be the cost, the filling up of the doors of a Mitchell oven with brick would be 4.6 times as expensive as the closing of the single opening in an oven of the beehive type.

To save this expense, doors were introduced, but they were found most expensive to keep in repair. They were barely put in commission before they had to be renewed. Now, however, there are several doors giving effective service. The difficulties to be met were four—to discover a door which would stand the heat, one which would not be too heavy to handle, one which would not rack itself by its own weight, and one with such favorable conditions for expansion and contraction that heating and cooling would be without evil effect.



THE OVEN DOORS AT BENTLEYVILLE, PENN.

It will be seen that the door is so arranged, as are, indeed, all successful doors, so that its iron framework does not come in contact with the fire, but is protected by 2 in. of firebrick, which is kept in place by being molded integrally with a wedge-shaped back, which fits into the door frame. The whole face of the door between the iron work is usually plastered with clay and this prevents air from passing through the door between the loosely fitting firebrick. The iron in the door castings is specified as No. 1 Bessemer or Cherry Valley foundry iron.



These doors have been in use about three years and they have given complete satisfaction. It will be seen that they are made in two parts. The lower half reaches to the level of the top of the charge and is closed before the coal is run into the oven. The upper half is swung too, and is mudded later as the oven gets hot and all the cracks are carefully mudded so that the oven is as effectually closed as if walled in. Each part of the door is hinged on one side and has a latch by which it is secured, and in the lower half a ring by which the

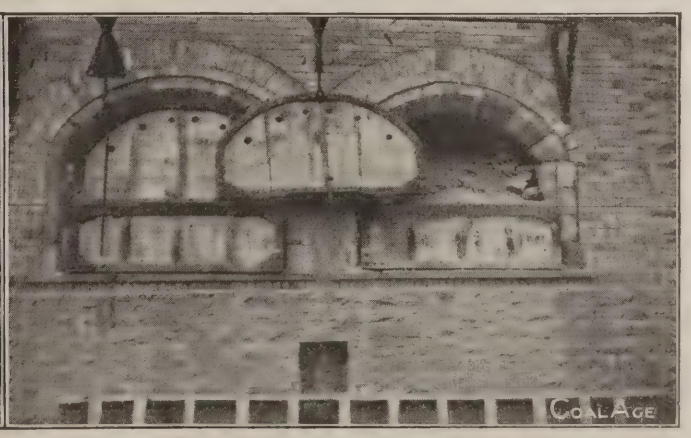
Coke-Oven Doors Installed at Acme Plant of Pittsburgh-Westmoreland Coal Co.

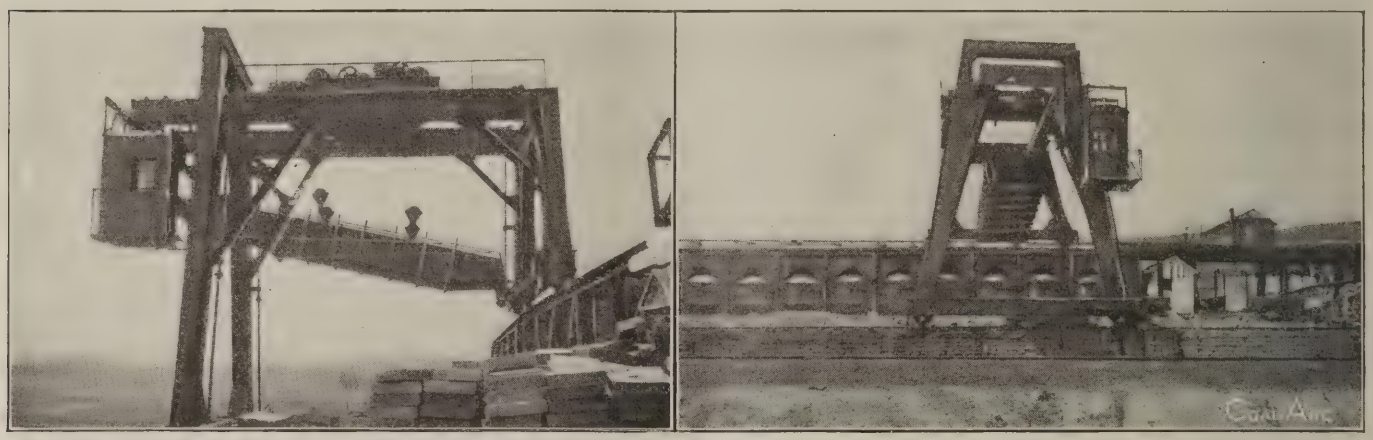


door may be swung open. Two laborers each mud 150 doors per day.

The Coke-Oven Doors at Denbo, Penn.

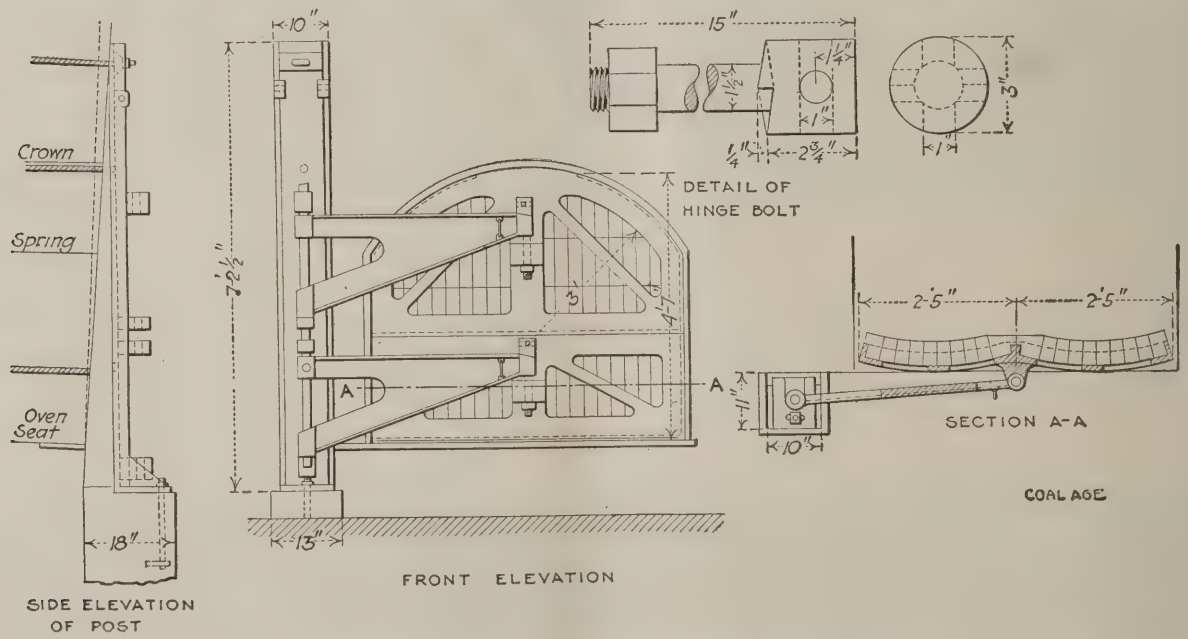
At the Denbo mine, at Reliance, a door is used which can be swung from a track, bracketed above the row of oven doors. This track projects somewhat, therefore, beyond the front of the oven wall. The suspension is by means of a hook attached to a small trolley wheel. This hook projects from the side of a bar and can be pushed into a hole at the top of the door and secured in place by passing the end of the bar into a catch on the lower part of the frame of the upper half of the door. The lower half of the door can be attached to the upper half, so that both can be swung from the track above, as has been described.

A Door for the Gantry End of an Oven at the Huron Plant near New Alexandria, Penn.



Oven Doors at Denbo Plant of Reliance Coke Co. near Brownsville, Penn.

The lower half of the door is none too heavy and is sometimes pushed out when, the leveler being at work, a large pile of coal runs forward onto the door. The round holes for airing the oven will be plainly noted. The one in the center line of the door and near the top is used for attaching the lifting hook. The oven wall, being on a slight batter, the weight of the door rests on the jambs and keeps the door in place. These doors have been in use at Denbo less than a year, but, so far, they are giving perfect satisfaction.



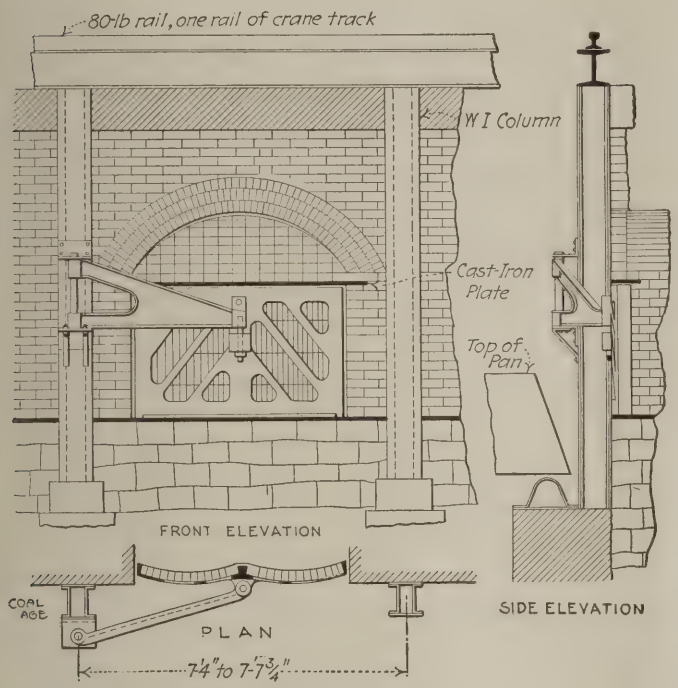
The Hay-Rule Door

The Huron plant, of the Keystone Coal & Coke Co., is using patented doors of R. Hay and P. B. Rule. by a cast-iron post, which rests on a small concrete base. The hinges are fastened to the post by a wrought-iron pipe and to the door section by a hinge bolt. The base of this hinge joint is in the shape of a helical screw, and as the supporting end of the hinge is made in a corresponding manner, it will be seen that a half turn of the bolt will raise the door, allowing it to be swung out.

On the crane side there is only one section to the door and this reaches almost up to the spring line of the opening. The balance of the door is filled with firebrick resting on an iron plate. The cast-iron posts which support the open doors on the pusher side are here replaced by posts, which are intended mainly to sustain an 80-

Two Views of the Gantry at the Huron Plant of the Keystone Coal & Coke Co.

Hay-Rule Door as Built for Pusher Face of Oven



There are two types of these doors, those on the pusher and those on the crane or receiving side. The frames of the doors are constructed of cast iron, which holds the lining of arch firebrick. The door on the pusher side, when closed, occupies all the opening except about an inch on either side and a small segment on the top. These side spaces are closed entirely and the top space is arranged to be just enough to permit the charge in the oven the requisite quantity of air.

The door is supported when swung away from the oven lb. T-rail. On this rail the forward end of the crane for handling the coke travels.

The whole arrangement on both sides was installed three years ago and has given satisfaction. The doors on the pusher side and the upper segment on the crane side have needed few replacements and none of the doors on the crane side have had to be renewed. It will be seen that the doors "fit" snugly at the bottom and at the line common to both sections. The only extended mudding to be done is at the sides and top.

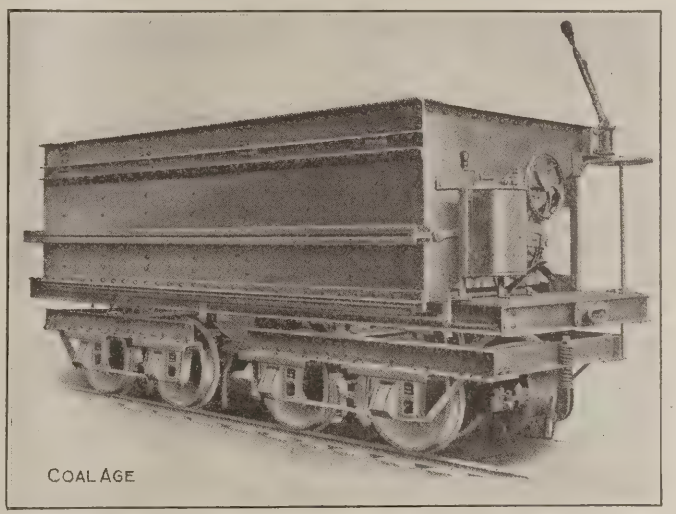
The Campbell Asbestos-Clay Daub

J. R. Campbell, chief chemist of the H. C. Frick Coke Co., has invented and patented an asbestos daubing material for coke ovens, and the Taylor Coal & Coke Co. has almost one hundred of them in service, some of which have been in operation since August. They are used with doors of the McMurray type. There are 12 doors at Lemont No. 2 of that type, and they are daubed with the asbestos-fireclay mixture.

Hay-Rule Door, Gantry End of Oven

It may be stated for those who do not know this type of door that it consists of a cast-iron plate with finger protrusions on which the asbestos-clay mixture is daubed. It was invented by William McMurray, superintendent of the Mount Pleasant Coke Company.

The material used is described as a special mixture of fireclay and asbestos, shipped out in the plastic state ready to be applied to the door. It must be well tamped into place and, if possible, the door should be allowed to dry out before being placed in service. However, that is not essential. A "green" door may be used without any harm being done. About 200 lb. is needed for an ordinary beehive-oven machine door. It is thought that one application, with a few occasional repairs, will last two or three years, though, of course, this will have to be ascertained in practice. So far the longest service has been for one year, at the Taylor Coal & Coke Co.'s Searight plant.



The material is made by the Harbison-Walker Co., and costs $10 per ton, f.o.b. cars, in minimum carload lots. In less than carload lots but in bulk, the cost is $12 per ton. If sent packed it will cost $4 to $5 more per ton.

A Slate Disposal Car

At many mines the disposal of slate and mine refuse from the tipple is a serious problem. Frequently mules are used for this purpose, while in some cases main and tail rope haulage is employed to move the slate cars on the dump.

The Atlas Car & Manufacturing Co., of Cleveland, Ohio, has brought out a line of self-propelled cars which appear to be admirably adapted to purposes of slate disposal, one of which is shown in the accompanying illustration.

The car shown, as may be clearly seen, is arranged for side dumping. It has double trucks built up of structural shapes. Two enclosed motors are supplied, operated from a drum type controller.

A Double-Truck, Side-Dump, Self-Propelled Mine Car for Slate Disposal

The car shown has a capacity of 200 cu.ft. The height above rail is 7 ft. 6 in., the width and length over all being 7 ft. 6 in. and 18 ft., respectively.

These cars may be made in many different sizes and types. Although the car illustrated is supplied with a trolley pole, it might with equal facility be equipped for operation by means of a third rail or be supplied with a storage battery. This latter arrangement would probably be the most convenient motive power for slate disposal.

Coal Freight Rates in Idaho—Freight rates on coal are to be made the basis of a suit before the Interstate Commerce Commission on behalf of the citizens of Boise and southwestern Idaho against the Oregon Short Line according to reports. The freight department of the road has been advised that the statements made by the coal dealers of Boise in respect to freight charged on coal from the Wyoming fields has caused much dissatisfaction.

The controversy is an outgrowth of the fight between the Boise school commissioners and coal dealers. Bids were asked for storage of coal, and as was the case in Salt Lake, all were the same. The coal dealers admit that they charge high prices, but insist that the Oregon Short Line refuses to weigh the cars at destination and that they have to charge for coal lost in transit.

According to the reports the utilities commission will bring suit before the Interstate Commerce Commission in the name of an individual, as the commission is said not to have the power to prosecute in its own name suits outside of the state courts. It will ask that the freight rates on coal from Wyoming points be reduced $1 a ton. The suit will also ask for the removal of the differential of 50c. a ton placed against Utah coal at American Falls. The coal dealers of southwestern Idaho say that this differential prohibits the shipment of coal from Utah into Idaho at a price low enough to compete with Wyoming coal. It will also be set up in the suit, that the Union Pacific owns the coal mines in Wyoming and that the differential is placed on the Utah coal at American Falls in order to bar Utah coal, most of which is mined by a subsidiary of the Denver & Rio Grande.

The Hillcrest Explosion

The explosion at Hillcrest is perhaps the worst mining disaster that ever occurred in Canada. Out of a total of 237 men who went down into the mine on the morning of the accident, only 41 were saved.

As the rescuers neared the seat of the explosion in the underground workings, the terrible force of the accident became more plainly visible; some of the bodies were literally torn to pieces.

It is probable that if General Manager Brown had not reversed the fan at the time he did, none of the 41 survivers would have been saved. Mr. Brown realized, immediately after the explosion occurred, that the first thought of the survivors would be to make their escape by means of the stope to mine No. 2. This conviction caused him to immediately reverse the course of the air. "When I felt that whiff of fresh air, I knew I was saved," is the statement of several survivors. They were about ready to give up in their fight for life when the fresh air came upon them.

Three of the rescue gang were overcome by gas and had to be carried out. The helmet men found bodies strewn in every direction and lying in every conceivable position. One man was found in a kneeling position with pick in hand ready to strike; when he was brought out, his arms were so rigid they had to be broken before they could be folded.

Joe Atchinson, a miner, was brought out and had every appearance of being dead. Some slight evidence of life, however, caused the doctors to work over him with artificial respiration methods. After some time, a faint flush appeared under the dust on his cheeks, and the doctors redoubled their efforts. The miner fought against them, and in his dazed state seemed determined to die, but after three hours he recovered and was soon able to assist in the rescue work.

Another miner by the name of Madison on his rush to safety passed many men who had just been overcome. One miner was struggling with his shoe, which had become fastened in a frog of the track. He finally succeeded in cutting the shoe from his foot and came out of the mouth of the stope with but one shoe. Madison, himself, says he felt inclined to lie down, but did not yield to the inclination and finally walked to safety.

The survivors have advanced different theories as to the cause of the accident. One man says it was a defective lamp; another believes it was a defective shot, while a third miner claims that a pocket of gas was liberated. All of these ideas are mere guesses, as none of the survivors was near the seat of the trouble. It is a fact, however, that for two days previous to the explosion, the mine had been idle, owing to slackness of business. During that time, gas may have collected in sufficient quantities to explode. Against this theory stands the favorable report of the fireboss who made his rounds before the men went to work.

Description of Hillcrest Colliery

Concerning the mine where the disaster occurred, W. J. Dick, Ottawa, Canada, has this to say: 'The mine is situated on a hill 1½ miles from Hillcrest Station. The mine tipple is on the valley level and is connected with the Canadian Pacific Railway by a spur track. The coal is brought from the mine to the tipple by means of a conveyor. There are three seams, of which only the upper one is being worked. The strike of the coal is northeast, and the dip 28 deg. to the west. The seams are badly broken by faults, and the coal is cut off by a fault at the face of the main entry, 4000 ft. from the entrance.

The room-and-pillar system of mining is used. Chutes 14 ft. wide and varying in length from 400 to 800 ft. are run up the dip. Room pillars are 50 ft. wide. The crosscuts are driven at intervals of 50 ft. An extraction of 65 per cent. is obtained. The pillars are removed by slicing on each side of the chute.

Gas has been found in the mine and Wolf safety lamps are used. The main road for 2000 ft. is lighted by electricity, 250 volts being used. All blasting is done under the supervision of shotfirers. Monobel powder, No. 6 detonators and fuse are used for shooting the coal. Holes are tamped with clay sent in from the surface. The mine is not subject to windy shots, nor has it experienced any previous explosion.

The mine has a capacity of 2000 tons a day, but only an actual average daily output of 800 tons.

The only other great accident in Alberta's coal-mining history occurred Dec. 9, 1910, when 31 men died in an accident at the Bellevue mine, not far fram Hillcrest. What the beneficiaries of the Hillcrest disaster will receive by way of compensation is a question that will come as an aftermath of the accident. The compensation act of Alberta decrees $1800 for each loss of life.

The Labor Situation

SYNOPSIS—Colorado is quiet but as the strike is not nearly settled and as the army may be removed before the militia regains its former strength, the prospects of trouble are imminent. In West Virginia peace seems insured. Some operators in Sebastian County, Arkansas, are trying to work without submitting to union dictation. In Ohio, there seems no hope of a wage settlement except in the lack of union funds. Iowa has agreed on a scale. In the anthracite region the certificating of mine foreman and the activity of safety inspectors are causing much trouble.

The fight between the Western Federation of Labor and the Industrial Workers of the World in the city of Butte, which is dominated by a Socialist administration, is convincing the world that dynamiting and murder are not always excusable avocations of a mining population. In this case there can be no talk of the iron heel of capital. If two factions of working men can so violently assault the other without excuse surely it is easy to conceive that one or either of them might assault another party, to wit capital equally without excuse. The Butte miners by their anarchy have weakened the sympathies of the whole country with the miners, whether of coal or copper, and disposed every one to accept the version of the operators concerning the Colorado trouble.

EMPLOYMENT OF MINE WORKERS

It is declared that the Colorado Fuel & Iron Co. is violating the proclaimed will of the Secretary of War and is bringing, into Colorado, men who are willing to work in its mines. This is not improbable seeing that the deliberate closing of certain of the plants and the crippling of others by governmental action is a high handed proceeding not at all justifiable under the circumstances and is obviously done not to preserve peace, but to legislate by force of arms. The autocratic manner in which this has been done would be more becoming in a mediaeval monarch than in a present-day appointee of the people.

GOVERNMENT HAS CLOSED NEARLY A SCORE OF MINES

The mines, the companies are endeavoring to recruit, are Sopris and Starkville. It is alleged that W. J. Gooden has smuggled men from New Mexico into Sopris under cover of darkness. It may be added that 19 coal mines are still closed down; Starkville, Santa Fé, Bowen, Empire, Thor, Southwestern, Wooten and Majestic in Las Animas County, Rockvale, Coal Creek and Fremont in Fremont County, Crested Butte in Gunnison, and Pictou, Maitland, Piñon, Rockland, Mutual, Gordon and McNally in Huerfano County. The strikers have driven the men out in the past and now the U. S. troops secure to the illegal forces of the union the ground they have gained in violation of the law, making the government a bulwark of violence and disorder.

SMALLER COMPANIES FACING FINANCIAL DISASTER

The chief sufferers appear to be the smaller companies. Their tonnage amounts to little, as far as the public is concerned, but much to themselves and they have registered a protest to the President. On June 18, J. A. Ownbey saw the President on behalf of the independent operators and represented that the closing of their mines by the union and the U. S. Army had made the financial difficulties so severe that the probabilities were that the stronger companies would eventually absorb them. And indeed reviewing the list of idle mines it is clear that the smaller mines have suffered most.

THE OWENS-KEATING RESOLUTION

The President is repeatedly stated to be about to compel arbitration and the Owens-Keating resolution in the House provides for a committtee to that end appointed by the president containing a mining engineer, a navy and army engineer, a man familiar with the handling of coal as merchandise, a sociologist and an employer of labor.

We doubt whether Congress has power to pass a law to determine wage and working conditions in any of the states of the union. It is hard to know what can be done by martial law because its limitations are ill defined, but constitutional law is less nebulous and a special law to regulate a specific industry at a special time in a certain section of the country and not applying specifically to interstate business is easily seen to be in conflict with our national constitution.

Mother Jones was finally admitted to Canada. The authorities were duly moved by clamor from the Canadian unionists and Mother Jones has been enabled and has fully availed herself of the opportunity to stir up strife between two friendly nations. She visited Nanaimo, Cumberland, South Wellington, Victoria and Vancouver. It is reported that she will speak in Charleroi, Penn., June 29.

Statements have been circulated that the pay-rolls of the Colorado Fuel & Iron Co. have been found to be heavily padded and that among the present miners there is a large amount of dissatisfaction. It is stated that they were given on entering the employ of the company places of such a character that large earnings could be made with but little labor. These places are now exhausted and the men are being moved to points where to get a large wage involves more work.

THE MILITIA'S DEMORALIZED CONDITION

The militia of the state of Colorado is not in condition to take the field, should the army be withdrawn. The 4 per cent. bonds for their payment and further expenses have not proved desirable to the public especially as the bonds must be marketed at par. They have been advertised in New York, Chicago and in Colorado without success.

The militia men are still resenting the one-sided truce called after the Ludlow battle and fear that the weakness displayed at that time may again put their lives in needless jeopardy. The strikers repeatedly broke their obligation. Gov. Ammons, despite this fact, kept his agreement, and as a result the militia was easily outnumbered by the movement of the strkers and the bands of militiamen were unable to go to one another's assistance. In all probability 35 officers will resign.

The report of the court martial of the Ludlow militiamen is not yet made public (June 23). All the men in troop A at Ludlow, including the 124 coal operators' employees, have received their pay. Governor Ammons, State Treasurer Leddy and Attorney-General Farrar voting for payment and Secretary of State Pearce and Auditor Kenehan voting against it. Company B has also been paid.

OPERATORS CONCEDE CHECK-OFF IN WEST VIRGINIA

In West Virginia a marked change has taken place. The operators who could not well be compelled by the arbitrating committee to pay a check-off, for some reason conceded it, stipulating that the amount collectible should not exceed $1.10 per man per month. The vote was taken on the proposition of the federal board of conciliation on the evening of the 22d and 23d, but the result is now declared irregular and the vote must be taken again.

It might be well to quote in full the recommendations of the commissioners, prefacing them with the remark that the public cannot expect the operators to defend them against iniquities such as the check-off. The people support such conspiracies by their influence and grumble whenever the effects are violence and slaughter and even the Department of Labor fully realizes that the most popular work it can perform is to aid the agitators to obtain funds for such desperate enterprises.

THE RECOMMENDATIONS OF THE COMMISSION

The following are the recommendations of the Commissioners of Conciliation who took under advisement the strike situation in West Virginia:

To the miners and operators of the Kanawha District of West Virginia, who are now in dispute and whose mines are idle and men are on strike:

We, the undersigned, Commissioners of Conciliation, duly appointed by the Secretary of Labor, recommend:

First. That the mines resume at once and the scale of 1912 be renewed for a period of two years, for the reason that we do not believe that there should be any change made in the terms and conditions of that agreement at this time or under the present business conditions.

In the event that either party is unwilling to adopt this recommendation we would then recommend that the miners return to work at once under the following conditions:

First. That the same wages be paid as were paid when the mines were closed down.

Second. That the operators pay the check-off for dues and assessments, not to exceed $1.10 in any one month, to the treasurer of the Local Union of the United Mine Workers of America, deducting the same from the wages of their employees for whom a scale agreement is made, when authority for such deduction is made in writing and releases the company from liability.

Third. That a Commission consisting of three persons, one to be selected by the miners, one by the operators, these two to select a third, and, in the event of their failure to select a third, then ten days from date the third member to be appointed by the Secretary of Labor from a list of five names jointly agreed upon to be transmitted to him within five days from the date of this recommendation, and, in the event that no list is transmitted the Secretary of Labor shall then appoint the third member of the Commission; this Commission shall be empowered to investigate and determine the actual wages paid for all classes of labor, and the tonnage rates, including such yardage as was provided for in the last scale agreement, in any and all mines which mine the same grades and character of coal, and which ship to the same markets at the same freight rate in competition with the coal mined by the operators of the Kanawha district of West Virginia.

Fourth. The Commission shall also be empowered, upon completion of its investigation, to fix the wages for all such labor ,and tonnage rates, including yardage, which shall be paid by the Kanawha Operators' Association to the miners in their employ during the life of a scale agreement which shall be immediately entered into by the Kanawha Operators' Association and the United Mine Workers of America, District No. 17, upon receipt of the finding of a majority of the Commission.

Fifth. The Commission shall render a decision within thirty days after its selection and the expenses of the Commission shall be paid jointly by the United Mine Workers and the Kanawha Operators' Association.

Sixth. The scale agreement signed upon receipt of the decision of the majority of the Commission shall be retroactive and cover the wages paid from the date of resumption.

We also recommend that rules shall be formulated in the new contract which shall provide for the settlement of disputes which may arise through Commissioners from the parties to the contract, who failing to settle a dispute, shall refer the matter in dispute to a Board of Arbitration; and that a further rule shall be made which shall enforce the carrying out of the contract by both parties thereto.

Respectfully submitted,

PATRICK GILDAY,
CHAS. W. MILLS,
A. L. FAULKNER,
Commissioners of Conciliation.

The second of these recommendations was accepted by the executive board of District No. 17 U. M. W. of A. and by the operators of the Kanawha district, but up to date it is not certain what the result of the referendum will be, the vote being exceedingly close, but probably in favor of that proposal of conciliation board, which the officials have seen fit to submit for consideration. The first which omitted the check-off did not meet with their approval. The second which may cause a reduction in wage is unsatisfactory to the men. They do not like to sacrifice wages for the privilege of having a check-off.

The fact that only the second of the two recommendations was submitted to the miners for ballot, has created much discontent. Thomas Haggerty, the international board member, received a telegram, June 4, from Secretary of Labor Wilson expressing surprise that the miners had not been given their choice of accepting either of the two propositions, or of rejecting both. Haggerty and Cairns in reply declared that both had been submitted.

Haggerty is extremely wrathful that the proposition he favors is not more popular and accuses some of the union men of collusion with the operators and as a result there has been a heated correspondence between Secretary Evans, of the Kanawha Coal Operators' Association and himself. In any event the strike cannot long continue. The union has neither funds nor harmony.

SUIT AGAINST MINERS' UNION WITHDRAWN

We are glad to note that the suit again John P. White and the other mine leaders is withdrawn because we do not like actions against the union to be entered except for the purpose of preventing them from performing illegal actions or to punish them for actual and not technical crimes. But the attorney's reasons for withdrawing the action and seeking a nolle prosequi are amusing if they are as related by the "Charleston Mail."

He is said to have pointed out that "while the organization might have affected competition in interstate commerce indirectly, it was not such as could be classed as a violation of the Sherman anti-trust law, the provisions of which are only applicable in cases where an agreement is made for the primary purpose of restricting interstate commerce to the advantages of one class and the detriment of another."

COMMENDABLE INACTION FOR A STRANGE REASON

Who ever violated the Sherman Act for the primary purpose of breaking its provisions? Does not every rich man who violates it, do so to make more money? Similiarly the miners were breaking it that they might make bigger wages. If this is an excuse, murder is not a crime because no one violates the law for the purpose of breaking it, but with the idea of killing his man. We are glad the miners are not to be prosecuted, but we are sorry that such a flimsy excuse has been taken for doing nothing. As a matter of fact, everyone believes that there is a need for winking at some technical faults in working men which are barely excusable in men of large property. Hardly anyone believes that the union, though a trust, should be suppressed. Beside faith in the Sherman act even for the rich is on a decline.

FOUR STATES AND MILBURN COAL COMPANIES

The Four States Coal Co., at Dorothy, W. Va., on Coal River has so far not settled its dispute. The rate at this mine has hitherto been 26½c. per ton for machine work and 31½c. for pick work, which latter rate is only operative in the drawing of pillars. The miners think the price should be equal to that paid for mining the Coalburg seam, which is 32½c. for machine loading in rooms and 56½c. for pick mining. They also want the check-off, though the ton rate is the main burden of their requirement. They also desire a shorter day and a 9-hr. day has been conceded by the company to take effect when the scale shall be signed in place of the 10-hr. day now worked.

The Milburn Coal Co., operating at the head of Paint Creek and mining gas coal desires a rate of 25c. a ton for machine-mined coal as in the present contract. The miners would raise this rate to 26c. The company produces no pick coal. The miners are on strike though the Union officials promised to keep them working until the Kanawha scale was settled.

THE TROUBLE IN ARKANSAS

The Bache interests in Sebastian County, Arkansas, some months ago, concluded to abrogate their contract with the union on the ground that they could not operate successfully under the scale in force. We do not know the nature of the agreement, but if it was for a specified time and did not give the Bache interests the right to nullify it at will, then the action which they took must subject them to the strongest criticism, though it must be conceded the unwillingness of the union to abide by its bargain and its frequent violation of its agreement furnished an excuse for nullifying the contract as was the case in central Pennsylvania. It is stated that the reason why the mining of coal was not profitable was because the mines were not properly operated, at least, Labor Commissioner J. C. Clary makes this statement in his report to Governor George W. Hays.

TROOPS BEFORE TROUBLE

Frank A. Youmans, of the federal court, enjoined the union not to interfere with the reopening of the Prairie Creek Mine No. 4 of the Mammoth Vein Coal Co., at Midland, Ark., on the St. Louis and San Francisco R.R. and the district attorney requested Franklin Bache not to begin hoisting coal until sufficient force was secured to assure them that the injunction would not be violated. On June 3, between 40 and 50 armed deputy United States marshals left for Midland to establish a guard about the property. According to U. S. Marshal Frank Mayes, none of the men who were employed by him had served as mine guards for the company.

On June 5, J. V. Bourland, the U. S. District Attorney, was ordered by Attorney General McReynolds to withdraw the deputies.

OHIO WAGE SCALE

So far no agreement has been effected in the state of Ohio and none may be expected for some time. On June 25, the eastern Ohio and Cambridge district operators withdrew from the joint-wage conference. The tonnage of these operators is about 20,000,000 tons or nearly 60 per cent. of the whole Ohio output. Still the conference continued in session, the Hocking, Pomeroy, Jackson, Crooksville and a part of the Bergholz districts trying to effect an agreement.

The operators offered a rate of 43c., which was an increase of 1.88c. on the 41.12c. previously offered. The operators insisted that if an agreement was made, no contract should be made thereafter with any other Ohio district at a lower figure and to this National Secretary-Treasurer Green alone assented.

The operators in five subdistricts mentioned, on the 26th inst. delivered an ultimatum stating that they would pay 44.69c. a ton for machine-mined coal on the mine-run basis, which is virtually the same as the mine-run rate in the Pittsburgh district, and 3.57c. more than the original offer. The miners want 49.65c. for machine and 71 3/7c. for pick-mined coal feeling that they are entitled to a better rate than Pittsburgh miners because of the cleaning which must be done,

because the coal has several bands of impurity. On the other hand, the operators having to compete with Pittsburgh coal feel unable to concede such a differential.

The Industrial Workers of the World have been organizing and urging the miners of Ohio to stop the passage of West Virginia coal through the disaffected districts, as this coal is replacing the Ohio coal on the markets. The method of "direct action" is openly advocated and the miners are urged to blow up railroad bridges and tie up traffic. The trains in Belmont County are moving slowly and guards have been placed on duty at the Little Grave Creek bridges above the Baltimore & Ohio R.R. passenger station, at Moundsville, W. Va., and at the Big Grave Creek bridge just near that city. The Benwood-Bellaire bridge is also being guarded.

IOWA WAGE AGREEMENT SETTLED

About 17,000 miners composing the Iowa district No. 13, voted on the 16th whether to accept or reject the wage scale under which they were working. The vote carried by 6136 to 3624, only 9760 out of 17,000 voting.

ANTHRACITE TROUBLES

The attitude of the Unions relative to the certificating of mine foremen will be noted editorially in our next issue, but we may say here that in accordance with the demand of the unions at the recent Pottsville meeting, on June 25 a suit was brought to restrain James E. Roderick, chief of the State Department of Mines from issuing certificates to 139 mine foremen and assistant mine foremen who passed the examinations held at Pottsville on May 25 and 26. James Matthews, president of district No. 9 brings the suit.

The Delaware, Lackawanna & Western R.R. coal department has had a dispute with its men who claim that the safety patrolmen have been making note of and reporting whether the men worked or not and have not confined themselves to their duties of protecting the men from the dangers of the industry. The miners desire that the patrolmen enter the union and declare these officials are underpaid. On the 24th the grievance committee of the 26 collieries, David W. Fowler, president, met Colonel Phillips, C. E. Tobey, P. J. Williams, Harry Davis, David Lloyd and Harry Harris and discussed the difficulty. It is said patrolmen will be told to restrict their activities to protection of the lives of the miners.

VANCOUVER NEWS

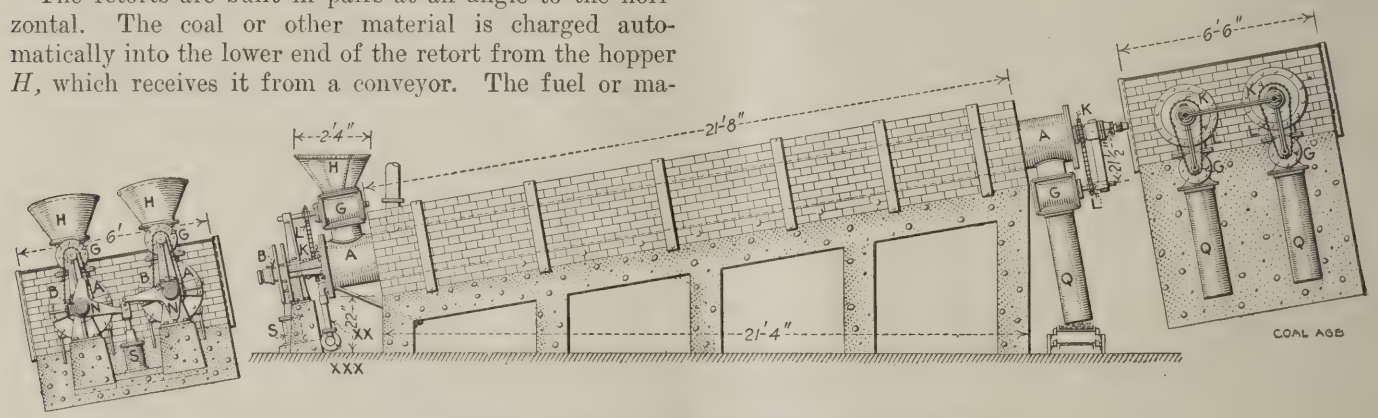
Robert Foster, president of District No. 28, notified the striking Vancouver miners that they must not be surprised if strike benefits were stopped at any time as the funds of the organization have been depleted. The organization had been paying them $15,000 weekly and $35,000 weekly to the Colorado strikers. Consequently it has been impossible to give relief to the Ohio strikers. Strike benefits might continue a week or even six weeks, but the men must not be surprised of a discontinuance at any time.

Notwithstanding the prospect of an early stoppage of strike pay the miners decided by 1467 to 274 in favor of a continuance of the suspension. It is interesting to note how few adherents the union in Vancouver now has. Meanwhile the mines in the district have all the men they can employ, the Western Fuel Co. having a waiting list of 100 men. No. 1 shaft at Esplanade in the middle of June hoisted 1121 tons, all the coal coming from the north side of the mine, the south side having been flooded when a fire started a year ago. The union would not permit the miners to wall off that part of the mine.

Attention should be called to the fact that the statement made by M. D. Foster, chairman of the House Committee of Mines and Mining relative to William Green, and published in our issue of May 9, p. 775, was declared by Green himself to be untrue. He stated, on being questioned by the Illinois District Mine Convention at Peoria, Ill., May 2: "I am not responsible at all times for what appears in the press reports, and take this opportunity of denying the article. I never agreed under any circumstances to waive recognition of our organization in Colorado."

How They Look to Each Other in Relative Importance

The Del Monte Process



By Samuel Dean*

SYNOPSIS—By this process, oil, gasoline and paraffin wax are secured as byproducts in coke making as well as tar, gas and ammonium sulphate.

Through the courtesy of the Oil & Carbon Products, Ltd., an opportunity was secured of examining the Del Monte plant, which is in operation near London, England. As is well known, there is a great demand at the present time for "oil" and motor spirit (gasoline), and the future will see this demand increased. Anyone interested may well pay a visit to this particular plant.

Crude oil is here distilled from bituminous coals, cannel coal, shale and peat. The hydrocarbons are driven off at the different temperatures at which they vaporize, and are then condensed by being brought into contact with cooler material. The liquid obtained is not a heavy tar, but a true petroleum of the paraffin series, which yields by treatment 30 to 40 per cent. of motor spirit.

The retorts are built in pairs at an angle to the horizontal. The coal or other material is charged automatically into the lower end of the retort from the hopper *H*, which receives it from a conveyor. The fuel or material passes from *H* into an air-tight rotary valve *G*, the function of which is to prevent the inlet of air or the outlet of gas.

Coke Retort Employed in Del Monte Process

The valve *G* delivers into the tube or retort *A*. *B* is an interior tube which runs through *A*, an Archimedean screw conveyor being threaded thereon. The hydraulic ram *S* actuates the hollow tube and Archimedean screw through the levers *N*.

The fuel material after being divested of the required byproducts, such as oil, gas, etc., is discharged from the tube *A* through the valves *G* to coke conveyors by means of the pipe *Q*. The valves *G* are operated from the hollow tube *B* by the chain and sprockets *L* and *K*.

The retort is heated externally by gas burners placed in brickwork beneath it, and internally by similar burners placed in the hollow tube *B*. No condenser is required, the incoming fuel condensing the greater portion of the volatiles which run from the pipe *XX* in the form of liquid distillates. The incondensible gases pass off through pipe *XXX*, to be scrubbed for the recovery of ammoniacal liquor and light spirits. This gas is afterward used for heating the retorts and in otherwise carrying on the process.

The flame temperature of all the burners varies from 1000 to 1100 deg. F., and the material being treated never reaches even these comparatively low temperatures. Depending upon the nature of the material being treated, the time consumed during its passage through the retort varies from 45 to 75 min. The coke or other residue is discharged in a cool state and quenching is not necessary.

130 Gallons of Oil Is Sometimes Secured

The yield of crude oil varies from nothing to 130 gal. to the ton, according to the material being treated. A sample of Scotch cannel coal produced 85 gal. of oil to the ton, the specific gravity being 0.82 to 0.92. Such oil could be scrubbed and used for motor purposes, although, of course, not very satisfactorily.

The analysis of the cannel coal was as follows:

	Per Cent.
Moisture	3
Volatile matter	42
Fixed carbon	41
Ash	14
Total	100

The residue from bituminous coking coal is semi-coke or smokeless fuel, which is excellent for domestic purposes. Ten to 12 per cent. of the volatile is left in this residue and is sufficient to give free combustion. If metallurgical coke is required, the residue can be further treated at high temperatures.

Bituminous coal with 30 per cent. of volatile matter yields approximately $\frac{8}{10}$ of a gallon of oil per ton for each 1 per cent. of volatile; 30 per cent. of this will be motor spirit, 30 per cent. fuel oil, 40 per cent. paraffin wax and liquid bitumens. By sacrificing the last two, the yield of motor spirit can be increased.

Taking a ton of bituminous coal with an analysis as follows: Volatile matter, 35 per cent.; ash, 5 per cent.; moisture, 4 per cent.; fixed carbon, 56 per cent., the yield would be about 30 gal. of crude oil, which would convert into 12 gal. of motor spirit and 5 gal. of fuel oil. The byproducts would also include 56 lb. of pitch, 15 lb. of sulphate of ammonia and 1200 lb. of residue fuel.

The expense of the process would be about as follows:

The cost of retorting would be	24c. a ton
The cost of converting oil	2c. a gal.
Standing charges	24c. a ton
Contingencies	10c. a ton

A plant capable of treating 1000 tons a day can be attended to by 4 to 6 men per shift, with an almost entire absence of noise, smoke or external heat. The whole proc-

*Croppers Lathom, Ormskirk, Eng.

ess is mechanical and continuous, the charging and emptying of the retort being done automatically and without interruption. At the present time the plant is stopped every night and started again in the morning. Nearly always a different sample of material is tested each day, as within two hours sufficient heat can be gotten up to start running.

The capital outlay for a complete plant is, roughly, $500 per ton per day, or, in other words, $500,000 to handle 1000 tons daily.

Fifty to 60 gal. of crude oil were obtained from one ton of bituminous shale or "oil shale." This substance contained from 40 to 50 per cent. of volatile matter. Tests are being made of shales and other material from Utah, Wyoming, North Dakota, Australia, Africa and other parts of the world. The cost of mining shale, which lies in thick beds near the surface, with a steam shovel, should not be more than 10c. per ton.

It is interesting to note that the inventor of the Del Monte process, Smith Everett, is an American. His home is now in England, but he was born in Palmyra, N. Y., and learned engineering in the United States. He was formerly engaged in railroad work (electric and steam) in Cuba. Mr. Del Monte is a Cuban. The concessionaire is W. H. Heath, 154 Cromwell Road, Kensington, London.

The writer desires to express his thanks to the above gentlemen for courtesies shown him during his visit.

The Byproduct Coke Industry in Russia

A few years ago the byproducts from coke works here were allowed to go to waste, but now there are in South Russia 10 factories, owned by nine firms, for the production and utilization of these products. During the first nine months of 1913, these firms were operating 887 recuperative coke ovens, in addition to a larger number not of the recuperative type, the former producing byproducts. The monthly average number of working recuperative ovens was 825, as compared with 389 in the corresponding period of 1912. The increase in the last four years in the proportion of recuperating ovens to the total number of coke ovens is shown by the following table:

Year	All Ovens Number	Recuperating Ovens Number	Recuperating Ovens Per Cent.
1910	4524	344	7.6
1911	5024	344	6.8
1912	5318	799	15.0
1913	5747	907	15.8

The aggregate of European Russia's coal deposits was stated in a recent report of the Russian Geological Committee to be about 75,000,000,000 tons. As regards the quality, it is said that the Donetz basin is the only locality that can supply metallurgical coke. The following table, covering a period of 10 years, shows in tons of 2000 lb., the quantities of coal used for coking in Russia and the amounts of coke produced therefrom:

Years	Coal	Coke	Years	Coal	Coke
1903	2,774,733	2,020,831	1908	3,963,600	2,932,560
1904	3,656,362	2,639,920	1909	3,958,866	2,890,393
1905	3,559,610	2,597,676	1910	4,079,930	3,018,213
1906	3,415,098	2,479,249	1911	4,930,655	3,642,647
1907	3,823,380	2,794,860	1912	5,689,411	4,252,697

Prices for coke given out on March 31, 1914, were as follows: First quality, $6.87 to $7.72 per ton; second quality, $5.72 to $6.29; small coke, $2.15 to $7.44; metallugrical coke, first quality, $6.58 to $7.44; briquettes, $5.44 to $6.02.

Coke and Byproducts in South Russia

The nine firms previously mentioned produced in all of their ovens 1,788,660 tons of coke during the first nine months of 1913, of which 1,022,400 tons went through the ovens designed for recuperating byproducts. The following table shows, in tons of 2000 lb., the production of byproducts during 1911 and 1912, and the first nine months of 1913:

Byproducts	1911	1912	Jan.-Sept., 1913	Byproducts	1911	1912	Jan.-Sept., 1913
Coal tar	9049	13,916	30,771	Sulphate of ammonia	357	2445	10,434
Ammonia water (25% strength)	3295	5,548	13,228	Spirits of ammonia	141	92	120
				Pitch	2745	2889	9,969
				Heavy oils	2229	2369	8,909

The increase in production was due to increases in the size and the number of ovens. Sulphate of ammonia is beginning to be used in Russia as a fertilizer; but most of it is still exported, principally to the southern states of Europe. The pitch found ready employment within the country, where it is mainly, if not exclusively, used in the production of briquettes. The heavy oils are used to great advantage for the impregnation of railway sleepers. Many more recuperating ovens are planned for 1914 and it is believed that all the pitch produced will be absorbed by the rapidly increasing output of briquettes, of which it is expected that over 500,000 tons will be manufactured in 1914. Some years ago briquettes were manufactured in Odessa from cheap coal dust, but they fell into disfavor when they began to contain too much clay, sand, and ashes.

The development in Russia of the manufacture of sulphate of ammonia, spirits of ammonia, and pitch has resulted in the almost total cessation of imports of these articles. Benzol, phenol, naphthalin and anthracene continue to be imported because they are not produced locally.

The Coppe system of ovens predominates in south Russia, but many ovens of the Carway and Otto types are also to be found. The control of the sale of coke byproducts from south Russian works is almost wholly in the hands of a firm in Kharkof, which publishes no price lists and is very conservative about furnishing information as to the average prices of the byproducts that it handles. A list of the firms in south Russia engaged in the production of byproducts from coke may be obtained from the Bureau of Foreign and Domestic Commerce or its branch offices.—*Daily Consular and Trade Report.*

Value of Service

[Quoted by David Ross in address before mine inspectors' convention at Pittsburgh, June 11, 1914.]

Is your salary all you receive for your working?
Is it prospect of hunger that keeps you from shirking?
Do you toil for the coin and for that by itself?
Is your industry wholly a question of pelf?
If so, heaven pity you, poorest of men,
You ought to be back with the mollusks again
In time protoplasmic—'mid pliocene murk,
If your salary is all you receive for your work.

If there isn't a smile from someone well served,
If there isn't a soul whom your kindness has nerved,
If there isn't a service you've rendered—beyond
The price of a coupon or government bond—
If there isn't a thrill of achievement in
The work of your day—something worthy to win
Past cash—you're a negligible part of the mob,
If your salary is all you get out of your job.

—Strickland Galligan in Indianapolis "Star."

Coke Manufacture and Blast Furnaces in Inner China*

SYNOPSIS—Coke was first made without ovens; later hand-washed coal and rectangular ovens of clay or brick were built. The coke is principally used in the smelting of iron in small clay furnaces, blast for which is furnished by hand.

An experience of several years in the oldest mine of China, known as the Pinghsiang mine, the only one in that country producing coke in accordance with European practice in commercial quantities, afforded an opportunity to become acquainted with the original methods of coke manufacture pursued in the provinces of Kiangsi and Hunan.

Interior of a Chinese Foundry, Showing Primitive Blast Furnace and Means of Supplying Draft

These methods, although relics of former times, are still largely followed, and a few ancient blast furnaces are yet in working condition. These furnaces, both in design and construction, give evidence of extremely early origin and are of especial interest to those historically inclined.

Following the fate of the ancient coke ovens, these blast furnaces are gradually becoming extinct, their disapearance being in direct ratio to the increase in the imported products—an increase which has been consistent in spite of the disadvantage of the great distance that separates China from foreign sources of supply.

The simplest method employed in the manufacture of coke consists in piling the coal taken from a suitable seam in a columnar form 16 to 19 ft. in diameter and 6 to 7 ft. high. Ignition is made at the bottom, and after the entire mass has reached incandescence it is covered from the bottom upward with a mixture of coke ashes and common clay. When the heat has cooled off after several days this jacket is removed, the coke then being available for distribution.

Hand Washing Is Employed.

Since the combustion losses were over 50 per cent. and the supply of a suitable grade of coal was not readily available, the next step in the evolution of coke-making methods represented a great advance. The coal coming from the mines with an average ash content of 25 per cent. is first crushed by wooden mallets or beetles, and then washed by hand in wooden tubs. In these tubs a flat, open-sided trough or basket made of bamboo matting is swung back and forth in such a manner that the lighter or purer coal is washed off and deposited in the bottom. The remainder or heavier material left in the trough contains about 50 per cent. of ash content. This is used as a material for firing the coke.

When the tubs have filled up a sufficient amount with

*Note—Abstracted from a translation from "Stahl und Eisen."

the washed coal they are emptied into carrying baskets, which are transported to the ovens slung on poles between the shoulders of two carriers.

The washing of four tons of crude coal represents a day's work for a laborer, the compensation being 4 cents, in addition to which he receives his meals, which represent an equivalent of 2 cents. An analysis of the coke made from coal washed in this manner shows an ash content of from 10 to 14 per cent.

The coke ovens are made of air-dried brick or clay, the walls being about 16 inches thick. They are rectangular in form and open at the top. They cover a space of about 8 ft. 3 in. by 65 ft. 6 in. at the base, and are 2 ft. 5 in. high on the inside.

The ground forming the floor of these ovens is first well tamped and then paved with brick. Spaced about 3 ft. apart in the long sidewall are openings approximately one by two feet in cross-section, provided for ignition purposes. These are faced on the opposite wall by brick chimneys 3x4 ft. in cross-sectional area, and about 3 ft. high.

The openings above mentioned are filled with wet coal transported in baskets, while the charge for coke making is covered with unburned brick and dabbed with clay and ash in as air-tight a manner as possible.

The material previously placed in front of the ignition openings is then fired. When combustion has progressed through the charge of coal as far as the chimney on the opposite wall, all of the air openings are closed.

These ovens are calculated to contain a charge of about 24 tons, delivering aproximately 16 tons of coke, although the average may not be so high. The life of the fire depends largely upon the amount of rain which falls during the coking process. This often soaks through the coal in the ovens to such an extent that coking is prolonged three days or more, during which time the ignition fires are frequently restarted five or six times. Ordinarily, however, the ovens are not tampered with, so that a good quality of hard coke is obtained, possessing a compressive strength of 2130 lb. to 2580 lb. per sq.in.

The construction of these ovens is simple and inexpensive, and their operation requires but little attendance. The losses due to wasteful combustion and the nonutilization of gases, however, are correspondingly high, and the production of one ton of coke requires an equal amount of ignition material.

Notwithstanding the fact that the coke produced under these conditions is uneconomical in the light of modern practice, the method is doubtless practical for small mines having limited capital.

This coke is used by the Chinese for smelting in small continuous blast furnaces. Limonite or brown iron ore and hematite, red iron ore, are usually employed for this purpose.

Small Clay Blast Furnaces Are Employed.

The type of blast furnace used consists of a conical vessel 6 ft. 6 in. high and divided into upper and lower halves. The walls are made of clay 12 in. thick, and the inside diameter at the top is 4 ft. and at the bottom 22 in. The walls are held together by circumferential iron bands.

Two openings lead into the bottom. The upper one serves as a passage for the air blast, and the other, which is closed by a clay plug, acts as a discharge for the pig iron.

To produce a draft a section of a hollow tree trunk is employed. In this a leather-packed piston is moved back and forth by hand. A suitable set of flap valves is employed, and the resulting air blast is conducted to the smelting furnace through a pipe.

The furnace is so arranged that for purposes of discharging its contents it can be tilted about 30 deg. toward the outlet opening. Charging is done hourly, brown iron ore and black sand, together with coke of the above manufacture, being mostly used. The output of such furnaces ranges according to the quality of ore from 1000 to 1500 lb. per day.

For smelting any given quantity of iron an equal weight of coke is necessary. Small pigs about 5 in. long and 1¼ in. square are cast from these furnaces, also small plates about 10x5x12 in. are produced. Although an analysis shows a comparatively high percentage of sulphur and silicon, this iron is not as brittle as might be expected. It is used chiefly in the manufacture of household dishes and utensils and in agricultural implements.

Ohio Breaks Coal Record

All previous records in the coal production of Ohio were exceeded in 1913, both in quantity and value, according to E. W. Parker, of the U. S. Geological Survey, notwithstanding the fact that coal-mining operations were seriously interfered with by an unprecedented flood in March and April of that year. It is estimated that the possible production was cut down probably 5,000,000 tons on account of high water.

In spite of this interruption the production increased from the previous maximum output of 34,528,797 short tons in 1912, to 36,200,627 in 1913, or a gain of 1,671,830 tons. The value increased from $37,083,363 to $39,948,058, while the average value per ton showed an advance of 3 cents, or from $1.07 in 1912, to $1.10 in 1913.

The average number of working days made by the employees was 206 as against 201 in 1912, and the average production by each man employed was 790 tons for the year, compared with 758 in 1912. In 1913, 32,642,848 tons or 90.2 per cent. of Ohio's total production was mined by machine. At the present time Ohio has less than 4 per cent. of the total output reported as shot off the solid. Out of a total of 1681 machines in use in 1913, 1421 or nearly 85 per cent. were of the chain breast type. Short-wall machines are growing in popularity as is indicated by an increase in their numbers from 106 in 1912, to 187 in 1913. The number of long wall machines increased from 2 to 17, and the number of pick machines decreased from 77 to 56.

Reports of the Bureau of Mines show that the coal-mining fatalities in 1913 numbered 165 as against 133 for the previous year.

Washington State First-Aid Meet

A first-aid and mine-rescue contest will be held at Seattle, Wash., on July 22 and 23, under the auspices of the Bureau of Mines, the Washington Coal Operators' Association and the State Mine Inspection Department.

Who's Who in Coal Mining

James Pearson

Out in Montana there is one man who graduated from the school of "hard knocks" and has succeeded with only that brand of college education. The fellow we refer to is James Pearson, who was born in Massillon, Ohio, 49 years ago.

He started as a trapper boy when 11 years old, and by the hardest kind of work advanced himself to the po-

JAMES PEARSON

sition of mine foreman with the What Cheer Coal Co. in Iowa. Later he became superintendent of the same company, afterward leaving the mines to accept a position as traveling salesman with the Harrison Machine Company The call of his early vocation, however, was too strong for him to resist, and he again took up coal mining, serving as foreman for the Sand Coulee Coal Co. in Montana. In a short time he was appointed superintendent of the Sand Coulee Co., later becoming superintendent of the Cottonwood Coal Co., another Montana concern, subsidiary to the Great Northern R.R.

Mr. Pearson's next position was that of manager for all the mines of the Cottonwood Coal Co. He continued in this capacity until he was appointed mining engineer for the Great Northern Ry. Co.

He is president of the Neal Creek Cattle Co., director of the Brown Coal Co., and president of the Sage Creek Coal Co., which corporation is opening a large coal mine at Lehigh, Fergus Co., Mont. He is also a member of the Electric City Club and the Elks Club, both of Great Falls, Mont. In addition, he is an executive board member of the Montana Coal Operators' Association. Mr. Pearson has been with his present company 22 years, and during that long period of administration has not had one day's shut-down on account of strikes. Nothing could bear more forcible witness to his ability as a leader and manager of men.

Henry S. Geismer

It used to be the vogue to always go West when seeking an avenue to dissipate business energy, and incidentally accumulate a bank account, but the direction of travel has changed somewhat, and many men look upon the South as the land of promise. One young man who has cast his lot in the southland is Henry Geismer. He first saw the light of day in Union City, Mich., early in the spring of 1875.

Mr. Geismer had excellent advantages in the way of an education ,graduating from the University of Mich-

HENRY S. GEISMER

igan as a civil engineer in 1897. Without wasting any time amid the pines of Michigan, he hit a hot trail for Alabama, secured a job right away as mining engineer with the Sloss-Sheffield Steel & Iron Co., later serving as engineer for the Tennessee Coal, Iron & R.R. Co.

This work occupied about eight years of Mr. Geismer's time and effort and prepared him well for his next job as chief engineer of the Republic Iron & Steel Co. (southern district). From 1907 to 1909 he filled the

position of general superintendent of coal mines for the last-mentioned company in the same southern district.

From 1909 to 1911 he was district manager of Georgia and Tennessee for the Southern Steel Co. While serving in this position he had charge of coal mines, ore mines, limestone quarries and two blast furnace plants.

In 1911 Mr. Geismer decided to start in business for himself, and formed the Keiser-Geismer Engineering Co. This new firm started business in September and met with much success from its earliest inception. In December, 1911, he was appointed receiver of the Chattanooga Iron and Coal Co., a $700,000 corporation. In December, 1912, he was appointed one of three appraisers for the properties of the Georgia Iron & Coal Co., a concern capitalized at $1,000,000.

He is a member of the American Institute of Mining Engineers and is a technical writer of ability and prominence.

Coke Crushers

By F. V. Hetzel*

SYNOPSIS—For best results coke must be split, not crushed. The most successful machines for this purpose are made with corrugated mating rolls built up of chilled segments. These should be provided with some means for uniform feeding.

In crushing run-of-oven size coke to smaller sizes, there are two important considerations: first, that the coke be reduced in size with a minimum amount of breeze or dust; second, that the crusher be such as to produce a fairly uniform range in the size of the product.

The brittle nature of coke calls for handling of somewhat different kind than that to which coal is ordinarily subjected. The coke should be split rather than hit or mashed, and the crusher should be such as to give the material this treatment with the minimum amount of contact between the lumps of coke and the crushing surface. On this account it has not been found practicable to size coke in crushers of the jaw or of the centrifugal hammer type. Two-roll crushers are in general use for reducing the size of coke, and these are of several varieties.

Over in England some gas works use a crusher which has spiral steel cutters, like lawnmower blades, mounted close together in the circumference of one roll, the other being made of a number of steel blades or disks with saw teeth, mounted on the roll shaft. The idea in this design is that the saw teeth act as a feed while the cutter blades shear the coke. This machine has not been used to any extent in this country, the disadvantage being that bits of coke wedge in between the saw blades, and in doing so and in being pushed out again some of the pieces are reduced to dust.

Some coke crushers in successful use have pyramid-shaped teeth, like those used on coal crushers, but the trend of modern practice is toward machines with grooved or corrugated rolls, the length of the grooves being parallel to the roll shaft. These grooves vary in width from 2½ in. to 3½ in. and in depth from 1½ in. to 2½ in. The grooves are rounded on the bottom so that pieces cannot stick in them, and the action of the machine is such that lumps which bridge over between the tops of adjacent grooves are split or cracked by the shearing action of the ridges on the mating roll.

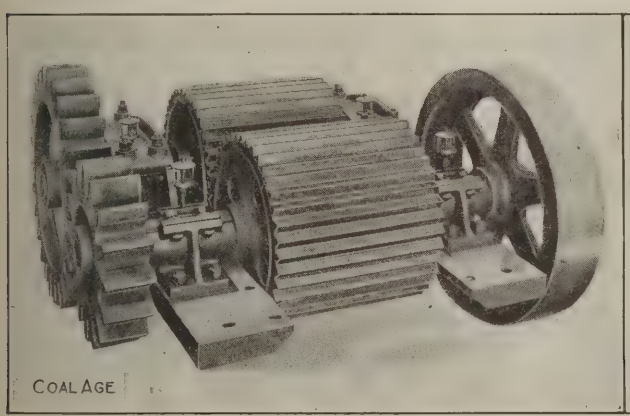


Fig. 1. Crusher with Chilled Cast-Iron Rolls

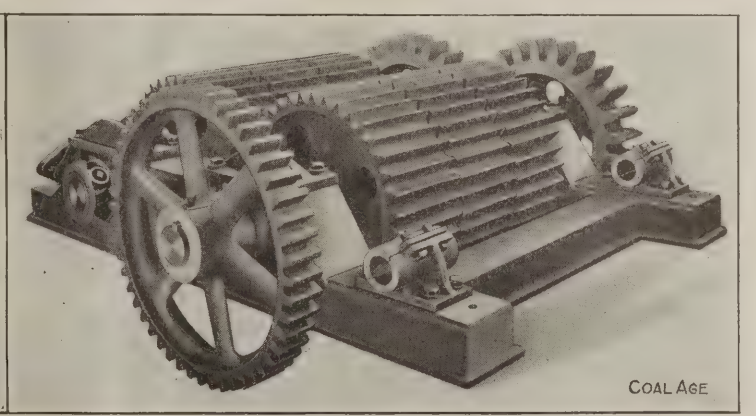

Fig. 2. Crusher with Rolls in Sections

Rolls of this kind are, in the smaller sizes (see Fig. 1), made in one piece of chilled cast iron; in some of the larger sizes, the rolls are made in sections which can be turned end for end or changed in position on the shaft if the diameter should become unevenly worn (see Fig. 2), but in the best crushers the rolls are built up of chilled iron segments bolted to heavy steel or cast-iron centers which are keyed to the roll shaft (see Fig. 3).

Feeders Are Necessary

In order to size coke properly the feed to the crusher should be steady and uniform and evenly distributed across the face of the rolls. If coke is drawn direct from a bin into the crusher, or if a skip load or carload

*Chief engineer, Link-Belt Co., Philadelphia, Penn.

is dumped into it, the crowding and tumbling of the material on top of the rolls causes useless breakage and the production of too much breeze.

At the same time, the middle portions of the rolls drag in more coke than the ends, and as a consequence the middle part has more work to do, becomes smaller in diameter than the ends, and it becomes difficult to maintain a proper sizing of the product. The same bad effects are produced if the crusher is fed by a chute which is narrower than the face of the rolls.

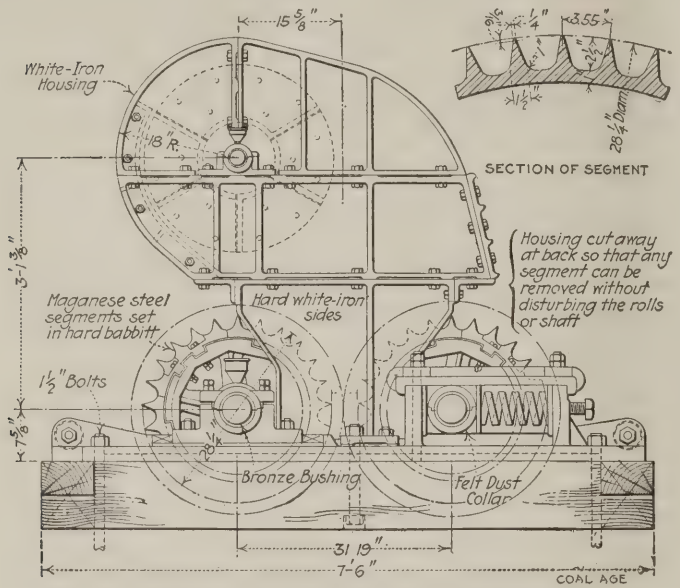

FIG. 3. CRUSHER WITH CHILLED SEGMENTAL ROLLS

The remedy for both of these evils is to use a feeder of some kind. Sometimes this is a belt conveyor or a conveyor of the steel-apron type (see Fig. 4). The advantage of the latter is that it works at a slow speed and will draw coke out of a dump hopper without that danger

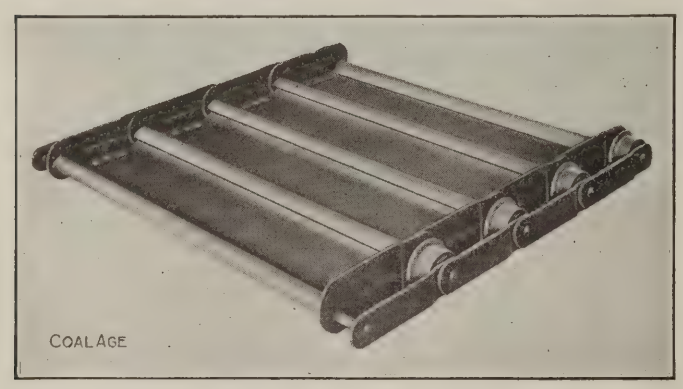

FIG. 4. SECTION OF STEEL APRON USED FOR FEEDING

to the carrying medium which is always present when a belt conveyor is used for feeding.

THE REVOLVING VANE FEEDER HAS DECIDED ADVANTAGES

Another feeder which has decided advantages is the ordinary vane or roll feeder, and when this is mounted directly on the crusher frame the installation becomes quite simple and compact (see Fig. 5). The crusher shown in the picture has rolls 31 in. in diam. by 30 in. long, mounted on heavy shafts geared together by long tooth spur gears, the teeth being made long so that the space between the rolls can be varied to produce crushed coke of several ranges of size.

The rolls are built up of chilled-iron segments bolted to cast-iron centers, and the frame or housing is so made that either shaft can be backed out of position and lifted clear without disturbing any part of the frame, feeder or the chutes. In a similar way any segment on either roll

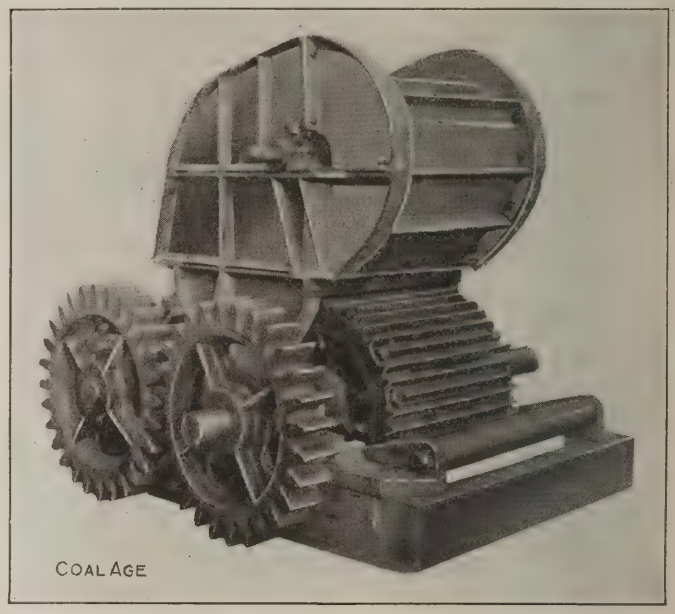

FIG. 5. CRUSHER WITH VANE FEEDER MOUNTED ON THE HOUSING

can be unbolted and a new one inserted without disturbing the roll shafts or the setting of the gears.

The feeder roll is made of hard cast-iron plates or vanes fastened to centers keyed to the shaft; a slow-speed drive is employed, and the plates or vanes pick up coke from the chute and deliver it to the crusher at a uniform rate. At the same time they distribute it over the full face of the rolls and prevent the uneven wear previously referred to.

Crushing coke is not easy work. It demands hard rolls, hard cast-iron housing plates, dust-tight protection for bearings and convenient means for copious lubrication. No crusher can be depended upon to give a perfectly sized product, nor one which is entirely free from breeze. Hence it is necessary to use screens for separating the sizes and removing the fine material.

American Mine Safety Association

The business meeting of this association will be held in New York City, Sept. 7 to 10, inclusive. The first-aid and mine-rescue contest will be held at Terre Haute, Ind., on Saturday, Sept. 12. The details are not yet fully arranged. H. M. Wilson, the secretary-treasurer of the association, may be addressed at the Bureau of Mines, Pittsburgh, Penn.

Apart from the high economy and reliability of large steam turbo units there are other reasons in favor of turbines especially for electrical work. The turbo-generator is capable of holding momentary overloads even up to 100 per cent. without detriment to the plant itself.

Editorials

True Fuel Economy

There are at some coke works as many as four possible sources of power, and at all two. These last are the waste gases in coke making and the coke breeze, which latter, though available for the raising of steam, has no commercial value.

In plants where there are washeries, there is also the washer refuse, which may be separated into two parts, a fair boiler fuel running about 16 or 20 per cent. ash and a worthless refuse which is only fitted for the culm pile. Perhaps if the boiler feed mentioned were properly dried, coal having even more than 20 per cent. of ash might be used with economy. However, at present, such use is not practicable as the boiler fuel contains 6 or 7 per cent. of "free" water and is usually fed by shovel, such wet and adhering coal not being mechanically stoked. Under these conditions, it does not pay to burn refuse having a lower thermal efficiency than that indicated.

Another source of power is often found in the roof of the mine; the "rooster bed" of the Pittsburgh seam, for instance, being nearly always too sulphury to convert into coke, but well suited for steam uses on the plant. In many cases, large quantities of this coal are brought out with that portion of the draw slate which is not stowed in the mine. This fuel piled with the slate in great hill-like dumps soon catches fire, burns and fills the valleys with sulphurous fumes and clouds of smoke.

These are the great losses in the coke region. We should perhaps lash ourselves into a fury about them, and imitate the conservationists in condemning the operators for them. Perhaps, however, the charge will rest more appropriately on other shoulders, for the losses will hardly be eliminated till there is a demand for power in those sections of the country where they occur. The mines, it is true, do themselves need power for their operation and this need is continually on the increase, but the many sources of fuel which the wastes provide cause the operators to utilize part of some one of these sources and neglect all the rest. Almost any one alone will give the average operator all the power he wants.

And in this condition there will be no change until the sections of the country now producing coal are supplied with factories and peopled with artizans making finished products. As long as the New England states and the state of New York produce the bulk of the articles in common use, largely out of raw materials manufactured in the coal-mining states, and as long as the fuel for the factories making these products is brought hundreds of miles over the railroads and along the American coast at a useless expense of more fuel, so long will other fuel values, too low grade to transport long distances, be wasted at their source.

One of the crying needs of industry today is for a relocation which will make operation cheaper. Manufacture and fuel should come closer together. We believe that in England the correct allocation of industry has been more nearly reached than in this country. Unfortunately, from an early date excellent railroad connections have made the separation of mine and factory less objectionable and wasteful than it well might be, but it is hardly necessary to declare that because the fault might be a greater source of loss than it is, is no conceivable reason why it should not be rectified.

A drift from the present coal-consuming to the coal-producing sections should have taken place long ago and even today such a tide of industry is not too late. We discuss freight rates and coal prices with unreasoning fierceness and talk economy with a convincing knowledge of thermal units, but might we not show equal discretion in discerning that freight rates will never be lower than when eliminated and fuel will never be cheaper than when we obtain it from the combustion of waste products? These eliminations and economies we can only secure by locating our factories where the logic of the situation would place them.

If you would take a short convincing course in "motion study," stand by a coal-carrying railroad and watch the cars passing by, transporting fuel that should never be transported and returning with manufactured products to the places where those products should have been advanced to their completed state. One-half our present-day travel is the result of a habit rather than the outcome of an economic study of the needs of industry.

And then the thoughtful observer seeing the riot of transport on our trunk lines, shuffling freight that never needed shuffling, will wonder whether a tariff between districts which would prevent fuel from moving to factories instead of factories moving to fuel would, on the whole, be a curse or a blessing to humanity in general and this country in particular. Would not such a measure, perhaps, unthinkable in some ways, tend to bring the coal consumer and producer into closer touch to the benefit of both?

The Good Faith of the Union

Settlements are still being made between miners and operators, though over three months have passed since the first day of April, the day on which the old scale expired. Yet outside of Ohio there has been no real suspension or strike in the central competitive district, though in some places the operators, and in some the miners, have been disposed to lay the mines idle, despite the vote at Indianapolis requiring a continuance of work during settlement. But on the whole, it must be conceded that J. P. White and his coadjutors have endeavored to keep faith with their declaration that they would not suspend or strike till it was clear that an agreement could not be secured by any other method.

We never suspected that Mr. White did not mean all that he said, though, of course, we knew, and the president of the United Mine Workers would not have denied, that he came to the conference with the strike as a potential weapon, even if he did not intend to use it. In fact, some think that he had already decided, when he came

into conference, that, if coaxing failed to accomplish his purpose, he would concede everything and indeed he ultimately did, after the nation's business had rapidly gone from bad to worse, and hopes for an increase in wages became nil. Some of the operators at the time, however, did suspect chicanery and frankly told him so. We are pleased to note that they were wrong.

Perhaps two years from now the leaders of the United Mine Workers will come to the conference having power, in case of a deadlock, to submit the matters at issue to arbitration. Meanwhile why not now discuss the basis on which arbitration should proceed? Otherwise, we shall establish a court without precedents and without known principles and may not find its decisions to our liking. Perhaps a constitution as a basis for decision would be a considerable help in making both sides willing to submit their case or ready to agree, before submission to arbitration becomes necessary.

When is a rise in rate justifiable? We fear some operators are a little disposed to say, "never, so long as it can be avoided"; whereas surely there are often good reasons for increases in wages, and a little investigation would furnish them as a basis for arbitration.

Looking backward, the doubts of Mr. White's faith seem ungenerous. He offered the operators exactly what they asked. They realized that he was making the public favorable to his ends by the concession and feared that he might be proposing nevertheless to play false. So they increased their demands to include arbitration. White might have been willing to concede it, but could not, in view of his instructions from Indianapolis.

The refusal to accede to arbitration did not prove bad faith and now we think it will be conceded that White never intended to do less than he promised. The logic of the situation and the pressure of bad times eventually proved that it was not for him to demand concessions, but to accept the operators' propositions unaltered. But in all the protracted discussions, he never shifed his position that there must be no strike, if an adjustment were obtainable without it.

Machine-Mining Fatalities

It is interesting to compare the fatalities in machine rooms with those in the breasts and pillars which are worked by hand, and to note how much fewer are the deaths resulting from machine methods than those resulting from pick mining in the bituminous mines of Pennsylvania.

SOME FATALITIES IN BITUMINOUS MINES OF PENNSYLVANIA IN 1912

Pick miners killed at face of workings by falls of roof.	92	
Pick miners killed on pillars by falls of roof.....	75	
Company men killed on pillars by falls of roof.....	1	
Total men killed in breasts and pillars by falls of roof		168
Miners killed by mining machines	1	
Machine runners and scrapers killed at face of workings	11	
Machine runners and scrapers killed removing pillars.	1	
Machine runners and scrapers killed by machinery....	4	
Machine runners and scrapers killed by electricity at face or in entry	3	
Loaders killed at face of workings.....	28	
Loaders killed on pillar work.....	1	
Loaders killed on entries by electricity.....	3	
Total men killed in breasts and pillars where machines are employed		52

This shows that though more than half the coal (50.8 per cent.) was mined by machinery, not one-fourth part of the accidents occurred in machine rooms and pillars reckoning all accidents likely to be affected by methods of operation except possibly explosions of gas, dust and powder. To include these figures would hardly change the calculation.

These results are much more convincing than those in Illinois, which have excited so much interest and concern. They apply also to a state with almost three times as large an output and where we believe machinery is more evenly distributed. It may be said that they prove nothing absolutely, for machines are excluded from the most dangerous places, but we nevertheless believe that mining machines do help the safety movement.

They speed up recovery and so enable the coal to be mined before the roof is weakened, for there seems to be something in the theory that it takes time for a mine roof to break. They increase the output per man and so reduce the fatality rate per ton. They prevent blasting out of the solid and so render heavy shattering shots unnecessary. They make it needless for men to crawl under the cut in the dangerous manner of the pick miner and perhaps the reduction in the labor involved may render the machine cutter better able to attend to his roof testing. The greater frequency of inspection where a large tonnage comes from a small number of rooms may also be a cause of this better result.

Anthracite Region--A Modern Tower of Babel

The seven counties of Pennsylvania where anthracite mining is the principal industry, have a total population of 1,122,361 people, of which number 529,262 or 47.15 per cent. are foreigners, or the children of foreign-born parents. According to race, the Russians come first with 119,382; next in order come the Austrians, Irish, Germans, Italians, Welsh, English, Hungarians and Scotch.

Is it any wonder that the officers of anthracite companies, as well as the state inspectors, have difficulty in securing obedience to mine rules and mining laws? A large number of these foreigners are too old to master the English language, and it is because of this fact that the companies post notices in half a dozen languages.

When we consider this polyglot population, it is easier to understand the difficulties that invariably arise when employers and employees about the mines attempt to reach an amicable understanding in regard to wages and conditions of employment. Out of such a heterogeneous mass of men there is little likelihood of any large percentage of them gaining a correct idea of what it is they are contending for in their labor disputes. There is no doubt but that the labor leaders clearly understand the facts, but we doubt if even they can convey a lucid idea of their demands to the men they represent.

There is surely a wide field for effective work on the part of the state, the Y. M. C. A., and local mining institutes, in the hard-coal regions. Mining companies have of necessity come to a full recognition of the true situation and realize that their problems of ventilation, pumping and engineering are not of any greater importance than the vital question of educating and satisfying their employees. Industrial peace and industrial efficiency are essential to the success of any mining or commercial enterprise, and peace and efficiency cannot exist if the men entirely lack in understanding.

The successful corporations of the future will devote much time and effort to the study of social and educational work.

Motor Trucks for Handling Coal

That a large-capacity motor truck with power-dumping body may be just as efficient and economical on short-haul work as on long, has been abundantly proved again and again by the record sheets of the Youghiogheny Coal Co., of Pittsburgh. This company has shown it to be practicable to deliver from 250 to 400 tons of coal with a Peerless five-ton truck in a single night.

These tonnages have not been carried under special conditions, when the stage has been set for record-breaking, but were accomplished in the usual course of the company's business without any previous preparation whatever.

The Youghiogheny Coal Co. has a contract for coaling numerous large buildings in the downtown district of Pittsburgh. It operates a dock at the foot of Eighth St., where coal is unloaded from barges into overhead bins. The average haul from the dock to the various buildings which the company supplies is four-fifths of a mile.

On the night of Apr. 14, last, truck "C" of the company's fleet—a five-ton truck—left the dock on its first trip at 6:30 o'clock. By 11:30 o'clock it had hauled 30 loads to the Oliver power plant. Two loads went to the Fort Pitt Hotel, between 11:25 and 11:36 o'clock. Seven loads to the Union bank building took from 11:45 to 1:22 a.m. From 1:37 to 4:22 a.m., 11 loads were carried to the Farmers' Bank building. These 11 loads, owing to conditions at the building which make it necessary to unload with a slide instead of a rear dump, required as much time as 18 loads to the other buildings.

These trips consumed 10 hours. A total of 51 loads had been hauled, amounting to 316 tons 928 pounds.

The truck continued to be operated by the night shift for an hour and thirty-five minutes longer, carrying nine additional loads to the Oliver power plant, and one more to the Fort Pitt Hotel. This brought the total volume for the night to 60 loads, or 370 tons, 1760 lb. The mileage for the night trips was 46 miles, or four-fifths of a mile per trip.

Ohio Wage Scale

The latest information from Ohio is to the effect that on July 1, the operators and miners in the Hocking Valley, Pomeroy, Jackson and Crooksville districts were still negotiating. The miners cut their offer of 49.64c. for machine coal on the mine-run basis to 47c. The operators held firmly to 44.61c. Adjournment was taken till the following morning, both sides being optimistic of an early settlement.

Interesting Articles Next Week

We have found it impossible to crowd all the coke articles prepared for this special number in our issue this week. As a consequence, succeeding numbers of COAL AGE will contain various articles covering many other interesting problems pertaining to the manufacture of coke. In addition we will continue the series of articles on "The Use of Electricity in Coal Mining." Still another article we will publish next week, describes in great detail, "Indiana's First Electrically Operated Coal Mine."

Extracts from a Superintendent's Diary

When we abolished the saloon from our camp, we hoped that one kind of family discord would be abolished with it, but we were mistaken. Apparently we'll have to abolish a certain few of our families before we can achieve so desirable a condition.

Take old John Ross for example: Every pay-day since the saloon was outlawed, John has sneaked off to the city, urged on by terrible thirst, and returned with the thirst quenched, but with fists and tongue active.

Sometimes the grand finale came at ten and sometimes at twelve o'clock the same night, but, aside from the time element, there is little variation. His wife calls in the neighbors just in time to prevent a knock-out blow, and the day following Tom awakes somewhere near noon, quite unconscious of all the commotion he has originated and proceeds to bathe the swollen eyes of his wife, the while he vows that he has forever sworn off.

Yesterday being pay-day, I decided to assist Tom's wife, and so, when I saw Tom sneaking off, I hailed him and reminded him that his little five-year-old (Harry) had been promised new shoes with blue kid tops, and that, according to promise, Harry should be taken to town and thus be assured a perfect fit.

I make no claim to the scheme; it was furnished me by Tom's wife. Here is how it worked out:

At six o'clock Tom returned as usual on the local, accompanied by his usual jag, but Harry was nowhere to be found. The more we questioned Tom, the less we knew, and so in disgust we hurried him off to bed and began to search out all of the others who had been to town and had noticed Tom during the day.

By plotting all the facts (during all this time, while we were gathering the news, the entire camp was in an uproar; some wanted to lynch Tom, others wanted to hire a special and go to the city in search of Harry, while still others routed the telegraph operator out of bed and got busy with the wires), we learned that by ten o'clock Tom had purchased the shoes and he and Harry had been seen marching up and down, quite after the approved manner of father and son. By twelve o'clock Harry had been left in the waiting-room of the station while Tom went out to purchase a lunch; by two o'clock Harry had considered himself deserted and had been seen by several at the station, in very great distress; that was the last dope on Harry.

Tom had been found sleeping in an alley by a policeman, at about ten minutes before leaving time for the local, and had been hustled aboard by the policeman and several of our miners who happened along. None of these particular miners had recalled that Harry had accompanied his father in the morning, and so made no inquiry.

About twelve o'clock Mrs. Tom came down and plainly told me what she thought of me for allowing a man like Tom to take off her child without having someone made responsible for his return. That settled the matter! It was up to me to return Harry. I promptly got in touch with the city police department by long-distance 'phone. Yes; there was a little boy who had said that his name was Harry, now sound asleep in the chief's office, and in one hand he still held on to two little blue top shoes.

Perhaps, because of the fact that Mrs. Tom does our family sewing, Mr. Tom and his family won't be abolished forthwith.

Legal Department

Recent Decisions

BY A. L. H. STREET*

Corporation's Lien on Shares of Stock—The provisions of the Arkansas statutes which give a lien in favor of a corporation on stock, to secure payment of debts due the company from the holder of the stock, extends only to debts which are actually due, and not to unmatured obligations. (Arkansas Supreme Court, Young Coal Co. vs. Hill, 165 Southwestern Reporter 292.)

When Employer is Not Responsible for Defective Condition—A coal company is not liable for injury to an employee resulting from a defective condition in ways or machinery, unless negligence is attributable to the company in the matter of permitting the defective condition to arise or continue. (Alabama Supreme Court, Epsey vs. Canaba Coal Co., 64 Southern Reporter 753.)

Injury Caused by Falling Slate—A coal-mining company is liable for injury to a member of a timbering crew caused by falling slate, if his foreman, after making an investigation, directed him to continue work, and if there was no such obvious danger as would have justified the injured employee in refusing to proceed. (Kentucky Court of Appeals, Bracken vs. Lam Coal Co., 165 Southwestern Reporter 686.)

When Seller Need Not Tender Delivery—If a contract for a sale of coal for monthly deliveries obligates the buyer to order approximately a certain tonnage each month, the seller is not bound to tender that amount before he can recover damages for the buyer's failure to order the specified amounts. (United States Circuit Court of Appeals, Seventh Circuit; Alwart Bros. Coal Co. vs. Royal Colliery Co.; 211 Federal Reporter, 313.)

Damages for Delay in Constructing Coal Handling Apparatus—When a contractor for the construction of a coal-hoisting tower inexcusably fails to complete the work by the time agreed upon, damages are recoverable against him for loss of economic operation during the period of such delay, together with interest on that amount. (Massachusetts Supreme Judicial Court, C. W. Hunt Co. vs. Boston Elevated Ry. Co., 104 Northeastern Reporter, 728.)

Duty to Warn Employee of Danger—A coal company is liable for injury to an employee, caused by sudden starting of a wheel upon which he was assisting in adjusting a belt, if the company's represenatives failed to warn him of dangers which he could not readily appreciate, or if they failed to use reasonable care to safeguard him against the accident. (United States Circuit Court of Appeals, Third Circuit; Valley Camp Coal Co. vs. Kucewicz; 211 Federal Reporter 953.)

Recovery of Freight Overcharges—In a suit to recover from a railway company the excess of freight charges collected on coal shipments above reasonable charges, a shipper is entitled to show rates charged on shipments originating at the same points and hauled through the destination to other points, and, also, what rates are usually charged for hauling coal like distances under similar conditions. (Colorado Supreme Court, Kindel vs. Colorado & Southern Ry. Co., 139 Pacific Reporter 1105.)

Validity of Agreement for Payment to Shipper—An agreement by a railway company to pay a shipper 20c. per ton for "spotting" cars on the shipper's tracks in its own yards, is invalid under the Interstate Commerce Act, as amounting to a contract for an unlawful rebate. This charge cannot be sustained as a terminal charge, if it has never been published as such, as required by the Act. (New York Supreme Court, N. Y. Central & H. R. R.R. Co. vs. General Electric Co., 146 New York Supplement 322.)

Duty of Railway Company to Continue Switching Service—The fact that a shipper has denied liability for demurrage charges sought to be collected by a railway company is no excuse for discontinuance of switching service previously afforded him on a private track. He is entitled to sue to enjoin the company from wrongfully discontinuing the service, if discontinuance would seriously impair his business. If a railway company knows in advance that a consignee will not accept delivery of freight on a certain track and he is entitled to delivery elsewhere, demurrage charges cannot be based upon a delivery there. (Tennessee Supreme Court, Dunlap Lumber Co. vs. Nashville, Chattanooga & St. Louis Ry. Co., 165 Southwestern Reporter 224.)

Reasonableness of Freight Rates—The finding of the Interstate Commerce Commission as to the reasonableness, or otherwise, of a rate charged by a carrier in interstate commerce, is an administrative function properly delegated to the Commission, and is, if lawfully made, conclusive. If such finding of the Commission is, that a given rate is unreasonable, it is as if the unreasonableness of such rate were fixed by statute, so far as future charges are concerned. But such finding, although possessing evidential value, is not conclusive nor even prima facie evidence of the reasonableness of a rate in a suit brought by a shipper for damages sustained by him on account of excessive charges. (United States Circuit Court of Appeals, Third Circuit; Lehigh Valley R.R. Co. vs. Meeker, 211 Federal Reporter 785.)

Liability for Mine-Foreman's Negligence—Injury by Explosion—A mine foreman employed under the Pennsylvania laws may be engaged by the operator to perform service beyond his statutory duties, and the operator is liable for negligence in the manner in which he performs such outside duties. Plaintiff, a miner, inserted charges of explosive in coal in the wall of a chamber on assurance from a superior that, though the explosive was damp, it was safe for use. The charges, however, did not explode when set off nor when new charges were inserted near them. In striking a large mass of coal broken down by the second charges, one of the first charges was exploded by plaintiff's pick with the result that he was injured. Held, that the operator was liable for the injury sustained. (United States District Court, Southern District of New York; Calausky vs. Lehigh Valley Coal Co.; 212 Federal Reporter 304.)

Safety of Miner's Place of Work—An employer's failure to use a proper degree of care to furnish a safe place of work for his employees may be established by circumstantial evidence. "A miner who had just been employed by a coal company was directed to begin work in a room of a coal mine in which mining had been done a few days before. He drained out some of the water and cleared away débris, and then began to pick coal, and after he had been at work for about five minutes his pick struck an unexploded charge of an explosive that had been left in the coal, which caused an explosion that seriously injured him. It was held, that the explosion and the attendant circumstances are prima facie proof that the company failed to perform its absolute duty of furnishing the miner a safe place to work, and also that the miner was free from contributory negligence." (Kansas Supreme Court, Broseghini vs. Sheridan Coal Co., 139 Pacific Reporter 1025.)

Penalty for Mining Coal Near Boundary Line—Suit brought under the West Virginia statutes to recover a $500 penalty from a coal company for mining coal within 5 ft. of a line dividing adjoining coal lands must be instituted within one year after the penalty accrues. Such a company is liable for the acts of its employees in violating the statute without regard to whether the company authorized the violation. "The mere fact that the corporation had a general uninforced policy against violating the statute does not absolve it. * * * Those in charge of a mine for a corporation must see that the statute against mining within 5 ft. of a division line is observed, otherwise the corporation itself is liable for the penalty. The neglect, mistake, or disobedience of its servants in this particular will not excuse it. In this day of accurate civil engineering and efficiency organization there can be no neglect, mistake, or disobedience of the company's servants in violating the statute, but that for which the company itself is reasonably chargeable. A failure on the part of the corporation to see that its servants obey the statute, is its own nonobservance of the statute. A coal company cannot say that it notified its mine management to observe the property line and therefore is not responsible for the violation of the statute If this were so, there could be no enforcement of the statute under its terms. The act of the management and servants at the mine in such a particular is the act of the corporation without other proof of authority or approval." (West Virginia Supreme Court of Appeals, Gawthrop vs Fairmont Coal Co., 81 Southeastern Reporter 560.)

The Human Element in Coal Mining

By George N. Griffin*

During recent years much thought and attention have been given to the conditions of coal-mining camps as matters of consideration apart from the actual working conditions of the mine itself, and its immediate surroundings. Mining companies are realizing that many conditions are in existence in the various coal camps, which, to a great extent, make or mar the plant as a whole.

It is realized, of course, that a coal mine is opened as any other industrial enterprise is started, primarily for the purpose of getting a fair return for the money invested; hence the further fact must be acknowledged that unless such enterprises can be made to earn a fair return they cannot be kept in operation, as none of us relish the idea of investing money at a loss.

While this is true, yet I believe that several improvements can be made in many coal-mining camps and villages, which, though they call for the investment of much capital, will, indirectly, bring adequate returns to the plant as a whole.

Better Mining Towns Needed

First, I would mention suitable and comfortable dwellings for the employees; such as can be rented at a reasonable figure. Most of us have heard of houses which have been equipped with all the modern conveniences, such as electric lights, bath, toilets, etc., only to find that some of the tenants have used the bathtub as a receptacle for wood or coal or some of the other paraphernalia of housekeeping. This may be true in a few isolated cases, but usually good, comfortable dwellings are appreciated by the average mine worker.

It is true, though, that in some cases tenants will leave good houses owned by a company, to live in mere shacks for the sake of economy. Many of such shacks, if owned by a company, would be declared unfit for human habitation. Such people as these need educating up to a higher standard of living, and I think this is gradually being done. This is especially true of the rising generation, the members of which are rapidly assimilating American ideas of the correct standard of living. It would be well, also, if all coal companies (as some do) would take more interest in religious, educational and all other matters pertaining to better living conditions. It is a common practice on the part of many writers on life in mining camps to denounce conditions as altogether bad. That there is some truth in the statement that they are not what they should be, we all must admit, but it will not be so, if the same attention is paid to the educational, religious and amusement features, as is given in the average town.

The Employment of Idle Time

The great trouble, as I see it, is that frequently the only place to which the men can go except to their homes after the day's work is done, is the saloon with its attendant evils. Coal companies, I think, are beginning to realize that the intemperate habits of their employees are costing them much money.

To offset this, encouragement ought to be given to all kinds of healthy amusements and entertainments, such as baseball, football, picture shows, lectures on first-aid work, etc. A good game of football or baseball is much better for our men and boys than hanging around questionable places; hence a playground ought to be furnished, if possible. Much good can be accomplished if the fathers and mothers can be induced to keep in close touch with the school. This can be done by visiting the classes frequently, encouraging the teachers in their work and incidentally stimulating the children in their studies. By these visits the officials of the mining company will, also, be able to judge, to a certain extent at least, as to the ability of the teachers.

In all this work, great care must be taken to avoid the appearance of patronage, for the average workman detests being treated with condescension. In attempting to do these things, one of the most important matters is to secure the coöperation of the residents of all places where such work is undertaken. This includes the wives and children of the employees. If such coöperation can be secured, the sociological work will be made much easier, for the reason that all will feel that it is their job.

The bravery displayed at numerous tragedies with which mining centers have been afflicted, goes to prove that many unselfish, heroic souls are hidden behind grimy faces. Acts of heroism are being performed day by day that cannot be surpassed in any other department of human activity, war even included. Such material as this ought not to be neglected for we are quite sure that any uplift work expended will get its reward in a higher plane of living on the part of the residents of such camps. And as a byproduct, companies will get more intelligent and better service as a financial return for their additional investment.

*Mining superintendent, Republic Coal Co., Roundup, Mont.

Convention of American Peat Society

The eighth annual convention will meet at Duluth, Minn., Aug. 20 to 22, 1914. Experts of international renown on the commercial uses of peat lands and the reclamation of swamp lands will address the convention. The itinerary of the delegates, of whom more than 100 are expected, includes a trip over the Mesaba Range by special train as guests of the Duluth, Missabe & Northern Ry. and the Duluth & Iron Range Ry., auto rides about the city of Duluth, and a trip of inspection through the Minnesota Steel Co.'s new plant on the St. Louis River above Duluth. This will be the first convention at which the European countries will be represented. Among those scheduled to address the gathering are: C. L. Wood, of Stockton-on-Tees, England; Thomas Tomlinson, a well known engineer of Dublin, Ireland, who will discuss Ireland's peat bogs; K. Lubkowski, of Warsaw, Poland, who will talk on Russian peat deposits; Dr. Joseph Hyde Pratt, state geologist of North Carolina; Charles A. Davis, peat expert of the U. S. Bureau of Mines, who has made a special study of Mesaba Range formations; Dr. F. V. Coville, of the U. S. Bureau of Plant Industry; Robt. Blei, of Sacramento Calif.; John Wiedmer, of St. Louis, Mo.; Dean A. F. Woods, of the University of Minnesota; W. H. Emmons, State Geologist, and other state and national officials. On account of its international character, the convention is receiving much attention from Duluth and Mesaba Range engineers and professional men.

It is contended that producer gas provides a more satisfactory means of transmitting heat through an extensive plant than steam. The mains are probably less costly, and there are no losses corresponding with steam condensation, while for furnace work, high temperature and evaporating, it offers great convenience and an all-round economy which might be set down as equal to 30 per cent., over the direct burning of coal under such apparatus. In plants spread over a large area, gas can advantageously be carried to isolated gas engines, which, unlike steam engines, do not fall off in efficiency in the small sizes.

Discussion By Readers

A Longwall Proposition

Letter No. 4—The discussion of the proposition, submitted by H. R. Hartsuff, COAL AGE, June 6, p. 944, relating to the adoption of the longwall system of mining, should prove of interest, not only by way of determining whether the longwall method of mining is applicable under the conditions cited, but also by the comparison it suggests of the two general systems of mining, with respect to the safe and economic extraction of the coal.

Personally, I do not consider the conditions submitted by Mr. Hartsuff as favoring the adoption of longwall mining for the following reasons:

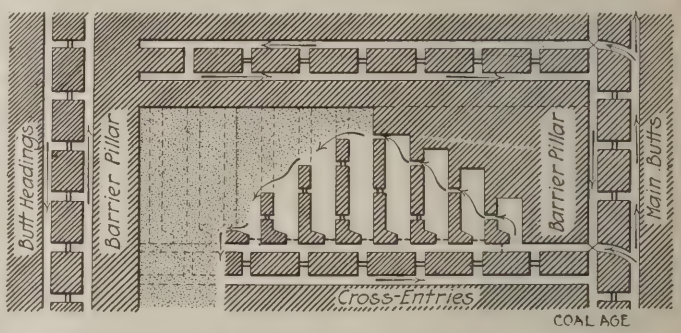
1. Longwall mining depends on three essential conditions; namely, (a) a hard bottom; (b) a pliable or yielding rather than a brittle roof; (c) a thin seam not exceeding 4 ft. in thickness, lying flat or but slightly inclined, at some considerable depth below the surface and free from faults or other troubles. The conditions last mentioned are the only ones that appear to be fulfilled in the present case.

2. In the application of the longwall method, in the present instance, disintegration of the fireclay bottom can reasonably be expected to take place over a large area of extraction. This disintegration would be more rapid in the roadways where the bottom is already broken, with the result that the roadside packs would be weakened and demolished very rapidly over the entire mine.

3. Under the conditions cited, the roof slate, varying from 4 to 10 ft. in thickness, would be the first affected by the extraction of the coal. This slate would settle away from the hard rock above and its weight would rest heavily on the packs and cause them to subside more rapidly. But the greatest danger would be experienced when a sufficient area has been mined to cause a break in the sulphur binder above. This break would be sudden, and the force of the impact when this overburden dropped through the few inches of space intervening between the roof slate resting on the packs and the rock above would undoubtedly be disastrous.

4. If the seam is gaseous, another danger would be presented by the accumulation of gas in the void space formed by the settling away of the roof slate from the overlying rock. This space would form a very convenient reservoir for the accumulation of dangerous gases. By the breaking of the rock strata above, the gas would be driven out forcibly into the mine workings, increasing the danger of the situation tenfold.

5. The cantilever action of the unbroken roof would cause an excessive pressure to be thrown on the coal face, which, owing to the large leverage, would be productive of grave danger unless successfully controlled.



The method of mining this seam, as described by Mr. Hartsuff, is an antiquated one. My experience as a miner in the northern bituminous coal field, where this method has been in operation for a period of about 80 years, leads me to conclude that it is not applicable to the mining of coal under any conditions. When compared with the room-and-pillar system of mining, the defects of the method become very prominent, the most important being: (a) Ineffectual ventilation; (b) the loss of a large percentage of coal.

I have come to regard the two general systems of mining—the room-and-pillar and the longwall system—as being sequential. In my opinion, the room-and-pillar system stands first and is adapted, either advancing or retreating, to any conditions where the coal seam does not lie at such a depth below the surface that the required width of room pillars is such as to restrict the rooms to the dimensions of entries. Before this condition is reached, the longwall system may be adopted, chiefly for monetary or economic reasons.

I would not adopt or advise the adoption of the longwall advancing method. While, for a time, it may possess advantages over the retreating method, these are soon superseded by the disadvantages that develop as the work progresses.

Referring, again, to the case in hand, I would make the following suggestions:

1. Make no change in the entry development.
2. Drive single rooms and proportion the width of

SHOWING PANEL WORKED ON RETREATING PLAN

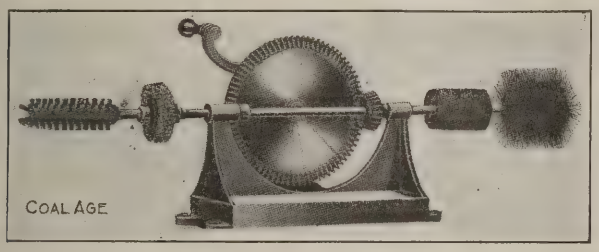
room to width of pillar, having due regard to the depth of cover, thickness of seam, character of roof, floor and coal, which elements practically determine this ratio.

3. As indicated in the accompanying diagram, drive the cross-entries only to the barrier pillar flanking the next pair of main entries, or butt headings; and make this barrier pillar of such width as to protect those headings from any danger of squeeze.

4. As each pair of cross-entries reaches the barrier pillar, start to turn rooms on the rise side of the entries, at the inby end; and work out the coal in this panel on the retreating plan. (This is a modified panel system of mining.)

In closing, let me say that I have seen this method in operation in a seam almost identical with that described by Mr. Hartsuff, except that there was an overburden of from 400 to 600 ft. The mine was operated with entire safety, and little trouble or expense was incurred from squeeze in the mine.

I. C. PARFITT.



Jerome, Penn.

Cleaning Safety-Lamp Gauzes

Referring to the inquiry from Johnstown, COAL AGE, June 20, p. 1024, I note a contributor asks for a "cheap and convenient method" for cleaning safety-lamp gauzes, so as to do the work effectively and avoid the installation of "a special machine for that purpose."

I have found, by long acquaintance with the work, that the statements made by this inquirer are correct. He states: "The usual method of cleaning the gauzes of a large number of safety lamps, especially where two gauzes are used in each lamp, consumes much time and is often imperfectly done. Without a close inspection of each gauze, it is difficult to detect when this work has been slighted."

While a number of machines have been designed and constructed for cleaning safety-lamp gauzes, I have found

A CHEAP AND EFFECTIVE MACHINE FOR CLEANING SAFETY-LAMP GAUZES

that the cheapest machine doing effective work of this kind is that illustrated in the accompanying figure. This machine is shown as being operated by hand; but, if desired, it can be readily mounted to be operated by power. I believe it has been found to do effective work wherever it has been employed. The same machine has been used to clean the glass chimneys of the lamps, as well as the wire gauzes. It is a great improvement over the common hand brush used for that purpose; and for this reason, I have suggested its use, for the benefit of the readers of COAL AGE.

Working Coal Seam with Heavy Parting

Letter No. 1—The question as to whether it would be profitable to work a 5-ft. coal seam with a heavy parting, depends to a very large extent on the market conditions and the competition with coal that can be more economically mined. If this competition is keen, it is possible that the seam in question cannot be worked with a profit. But if there is a fair margin between the market prices and the operating costs of the competing coals, it should be quite feasible to operate in this seam profitably; especially as the coal is said to be of a better quality than other coals in the district. It should be possible, also, to get a larger percentage of lump coal, than would usually be obtained from working a 5-ft. seam.

I have had a long experience in the longwall method of working, and, unless there are reasons, not stated, that would prevent, I would strongly recommend its adoption, for the following reasons: Yardage is eliminated; a maximum recovery of coal is obtained, which is an important factor in the working of a thin seam; the longwall method of working is more favorable to machine mining; ample space is available for stowing the waste from the thick parting; a larger percentage of lump coal will be obtained; ventilation is simplified; and supervision is easier.

The mining should be done in the parting, which should all be removed and stowed away before the coal is mined, in order to insure loading only clean coal. There are several methods by which the mining may be done and the best can probably only be determined by experiment. Machines that will undercut in the vein above the floor level can be used; or, by keeping the face of the upper bench of coal always in advance, an ordinary longwall machine can be used to mine either in the top or bottom of the parting, using the lower bench of coal for the floor. The remainder of the parting not cut out by the machine must be removed by shooting or by a hand pick. A few light shots should do the work. Another method that might be employed would be to cut out the parting with punching machines. It is necessary to mine in the parting, however, as it would be found to be impossible to separate the dirt and load clean coal if both were shot down together.

By the longwall method of working, the weight of the roof can be utilized to assist in bringing down the top coal, and but little powder will be required either for this work or in blasting out the bottom bench. A large proportion of lump should be obtained, especially as the mining is done in the parting, and no slack coal should be produced by this plan.

The parting will be used to make the packs, which must be built solidly; and, in order to do this, some large pieces will be needed to face up the packwalls. If these are not available from the parting, they must be obtained from the roof, which should break down in the waste spaces between the packs and thus relieve the face of some of the roof pressure. Some timber will be needed at the longwall face; but these props can be drawn and used over again as the face advances and the packwalls are built.

Not knowing the exact working conditions and the scale of wages, it is impossible to estimate with any certainty, the cost of mining this coal; but it should not exceed by 10c. per ton, the cost of mining a 5-ft. seam of coal under similar conditions but without the dirt parting. This additional cost would be partially, if not altogether, offset by the superior quality of the coal and the larger percentage of lump that will be produced.

C. V. GOULD,
Mining Engineer.

Salt Lake City, Utah.

Letter No. 2—Referring to the inquiry in regard to working a seam of coal 5 ft. thick with from 6 to 18 in. of parting in the middle of the seam, much will depend on the conditions. However, it may be stated, in a general way, that in order to insure good drainage in the mine, it is important to reach the lowest point of the seam and work toward the rise. By so doing the face of the workings will be generally dry.

If the mine is not already opened, the plan should be drawn on the triple-entry system. Cross-entries should be turned off the main road 600 ft. apart. Double rooms, 40 ft. wide, should be turned off on each side of the cross-entries and driven 300 ft. These rooms should be driven

on 70-ft. centers so as to provide a 30-ft. pillar between adjoining rooms. Tracks should be laid on each side of the rooms next to the rib or pillar. The cross-entries should be driven on 60-ft. centers so as to provide a good width of entry pillar, to avoid the danger of a squeeze, cutting off the roadways. As each room reaches the limit the pillars should be drawn back, in regular order. There will be plenty of space in these wide rooms for stowing the waste of the parting in the seam.

I am satisfied that this coal can be worked profitably, providing the parting can be cut with mining machines and provided there is a good market for the coal. Allowing 25c. per ton for loading the coal into the mine cars, 7c. per ton for machine cutting and 7c. per ton of coal for stowing away the slate and waste of the parting, would make the cost of coal loaded in the cars and ready to be hauled out of the mine, 39c. per ton. To this it will be necessary to add 10c. per ton for hauling and loading the coal into the railroad cars and, say 5c. per ton for royalty and 16c. per ton for other expenditures, such as rails, ties, posts and cap-pieces. This will make the total cost of the coal loaded on the railroad cars 70c. per ton, which I believe is possible under ordinary conditions of mining such a seam.

There being a large percentage of sulphur in this coal (3.73 per cent.), it will be necessary to take extra precautions, in the development of the mine, to avoid spontaneous combustion and gob fires. It is important to load out all the fine coal and slack produced and not permit this to be thrown into the gob. The time to take these precautions is when the mine is first opened out. It is less trouble to start right than to overcome the difficulties resulting later, in the development of a mine subject to frequent gob fires.

Should the plan I have suggested not prove successful, a change can be made to the longwall system of mining, with little or no extra cost. The longwall method, it is true, affords plenty of space for stowing away the waste material and yields a large recovery of the coal. In this system, the stalls or roads should be turned from 200 to 300 ft. apart. It will be necessary to shoot down the top over the roadways to provide sufficient headroom. This material can be used for building the roadpacks, which should be from 10 to 12 ft. in width on each side of the road. These packs must be well built in order to maintain a sufficient height in the roadways when the weight comes on the packs. The roads should be wide enough to allow a little room to stow any slate that may fall in the roads later; but this will not be much if the roof is good, as stated.

SAMSON SMITH.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Operation in Proportion—In any proportion expressing the equality of two or more ratios, there is usually one unknown term whose value is to be determined from the combined values of all the other terms. To ascertain the value of the unknown term **x**, write the couplet containing it as the second member of the proportion and the remaining couplet or couplets as the first member.

Observe carefully to write each couplet as a direct ratio when it increases or decreases in the same order as does the unknown ratio. If, however, an increase of the former causes a decrease of the latter or vice versa, the couplet must be written as an inverse ratio. The following example will serve to make this clear.

Example—If six miners load 200 tons of coal in 10 days, working 8 hr. a day; in how many days will five miners load 300 tons, working 9 hr. a day?

Solution—There are clearly four ratios in this question, including eight terms of which one is unknown and must be designated by **x**. The ratio of the miners is 6: 5; the tonnage, 200: 300; the days of work 10: **x**, and the hours per day 8: 9. These are all direct ratios, as they compare the first case mentioned, with the second, in the same order as that of the unknown ratio containing **x**.

The first step after finding these ratios, is to write the one containing the unknown term **x**, as the second member of the proportion; thus,

$$\frac{\quad}{\quad} : \frac{\quad}{\quad} :: 10 : x$$

Now, consider the miners as compared with the number of days they work. It is evident the more men employed, the less time will be required to do the work. Hence, this first couplet must be written as an inverse ratio: 5:6.

Next, considering the tonnage, it is clear that the more coal to be loaded, the more time will be required; and the tonnage is expressed, therefore, as a direct ratio, which is 200: 300.

Again, in regard to the last ratio, it is certain that the longer the working day, the less will be the number of days required to finish the work. This is, therefore, an inverse ratio, namely, 9: 8.

Writing these ratios, then, as a compound proportion,

$$\begin{matrix} 5 & : & 6 \\ 200 & : & 300 \\ 9 & : & 8 \end{matrix} :: 10 : x$$

The **rule of proportion** makes the product of the means equal to the product of the extremes. The value of the unknown term **x** is, therefore, found by dividing the product of the means, by the product of the known extremes, which are the antecedents of the couplets in the first member of the proportion. The method of cancellation simplifies the work; thus:

$$x = \frac{\overset{2}{\cancel{6}} \times \cancel{300} \times 8 \times \overset{2}{\cancel{10}}}{\underset{3}{\cancel{5}} \times \cancel{200} \times \cancel{9}} = 16 \text{ days}$$

The Coal Age Pocket Book

INVOLUTION

The word "involution" means a rolling up or involving. As applied to numbers, it means the process of multiplying a number by itself any given number of times. In other words, the number is taken so many times as a factor; and the resulting product is called the first, second, third, etc., **power** of the number according to the number of factors taken.

Powers of Numbers—The required power of a number is indicated by writing a small figure expressing such power, at the right and slightly above the number. The small figure is called an **"exponent"** or the **"index"** of the power.

The first power of a number is always the number itself. The second power is commonly called the **"square"** and the third power the **"cube"** of the number..

The following examples will serve to illustrate the process of finding the indicated power of any number; as 3, for example:

First power	$3^1 = 3$	$= 3$
Second power,	$3^2 = 3 \times 3$	$= 9$
Third power,	$3^3 = 3 \times 3 \times 3$	$= 27$
Fourth power,	$3^4 = 3 \times 3 \times 3 \times 3$	$= 81$
Fifth power,	$3^5 = 3 \times 3 \times 3 \times 3 \times 3$	$= 243$

The process of involution is thus seen to be that of a continuous multiplication of a number into itself, the resulting product being the power sought, such power being indicated by the number of factors employed. For the sake of ready reference, the squares and cubes of numbers from 1 to 1000, together with their square roots and reciprocals are given in the "Useful Tables for Engineers and Students."

Important—To shorten and simplify numerical calculations in involution it is well to note the following:

1. To find any power of a number having one or more ciphers at the end; discard the ciphers and find the required power of the number so diminished. To that result annex as many ciphers as the number discarded multiplied by the index of the power.

Thus, to cube 600, proceed as follows:

$$6^3 = 6 \times 6 \times 6 = 216.$$

To this annex, $2 \times 3 = 6$ ciphers; hence $600^3 = 216{,}000{,}000$

2. To find any power of a decimal, find the required power of the number, discarding the decimal point; and, in the result, point off as many decimal places as those in the original number multiplied by the index of the power.

Thus, to cube 0.4, proceed as follows:

$$4^3 = 4 \times 4 \times 4 = 64.$$

Then, point off $3 \times 1 = 3$ decimal places; hence, $0.4^3 = 0.064$.

3. The power of a number is equal to the product of two powers of that number, such that the sum of their indices is equal to the index of the original required power. For example, the fifth power of a number is equal to the product of the square and the cube of the number.

$$3^5 = 3 \times 3 \times 3 \times 3 \times 3 = 243$$

or

$$3^5 = 3^2 \times 3^3 = 9 \times 27 = 243.$$

Inquiries of General Interest

How to Buy Coal

Last year we purchased coal for the plants, at a contract price of $2.05 per net ton delivered. The contract for the purchase of this coal was based on the following proximate analysis:

	Percentage
Moisture	0.64
Volatile matter	39.07
Fixed carbon	55.14
Ash	5.15
Total	100.00
Sulphur	1.05 per cent.
Heat units	14,510 B.t.u.

During the year, we had two samples of this coal analyzed for our own satisfaction. Each of these analyses showed considerably less combustible matter and a far greater percentage of ash and sulphur than the original analysis on which the contract was made for the purchase of the coal. These two analyses also showed a much less heat value (B.t.u.) than the previous analysis. The samples for analysis were taken from two separate cars, at different times during the year. They are as follows:

	Percentage
Moisture	1.21
Volatile matter	34.39
Fixed carbon	52.51
Ash	11.89
Total	100.00
Sulphur	2.04 per cent.
Heat units	13,347 B.t.u.

The above sample was taken from Car 62,462. Another sample taken from Car 72,494 gave the following analysis:

	Percentage
Moisture	0.90
Volatile matter	28.00
Fixed carbon	52.58
Ash	18.52
Total	100.00
Sulphur	7.73 per cent.
Heat units	11,760 B.t.u.

Prior to last year, we had used only Pittsburgh district coal, which was purchased at a contract price of $2.40 per net ton, delivered. This coal gave a proximate analysis as follows:

	Percentage
Moisture	1.70
Volatile matter	31.80
Fixed carbon	60.10
Ash	6.40
Total	100.00
Sulphur	0.84 per cent.
Heat units	13,480 B.t.u.

A brief calculation of the cost of heat units, under last year's contract, as compared with the same item under the contract of previous years, shows that each cent expended for fuel, purchased 141,560 B.t.u., this calculation being based on the contract analysis of the coal first above given; while each cent of outlay in previous years purchased only 112,333 B.t.u. The increase in B.t.u., in favor of last year's contract, is thus 29,227 B.t.u. for each cent of outlay; or 26 per cent. of gain over the contract price of previous years. To offset this reduction in the price of coal, however, an examination of the records for the year shows that a considerably larger amount of coal was used during last year than in any year previous.

The question I desire to ask is whether the reduction in the price of the coal, on a heat-unit basis, justified last year's contract of purchase, judging from the first analysis submitted above as compared with the last analysis given, under which coal had been purchased in previous years. Kindly advise what factors of the analysis enter into such a comparison and determine the superior qualities of the coal for fuel purposes.

J. A. Flood,
Sec'y., Venango Mfg. Co.
Franklin, Penn.

The purchase of coal, in respect to economy of operation, can only be determined by a careful consideration of the requirements. It is not wholly a question of the cost of heat units, as the cheaper coal, on this basis, may contain impurities that cannot be permitted or that would forbid its use for the purpose intended.

There are certain limitations to the allowable percentages of the sulphur and ash shown in the proximate analysis of a coal intended for many purposes; while, for most fuel purposes, there are limits to the allowable percentage of bone or slate. Again, the hardness, weathering qualities, disposition to heat in bunkers, and similar characteristics, must be considered. In practice, the flaming quality of coals is often an important factor and determines or limits the adaptation of a particular coal for use under certain types of boilers.

The fact that a much larger amount of coal was used last year, in the operation of this plant, of itself proves nothing, since a larger amount of work may have been done, for which greater horsepower would be required. However, it is plainly evident that the two analyses made during the year compare very unfavorably with the contract analysis first given, both in the decrease of combustible matter they show and the increase of impurities in the coal. It is possible, however, that the two analyses made during the year were not representative of the coal used.

The sampling of coal for purpose of analysis is a most important item in the determination of the value of the coal. The analysis of samples of coal taken from the same car will often vary very widely, in the percentage of volatile matter shown and more especially in the percentage of impurities present. For this reason, it is never safe to rely on one or two analyses; but numerous samples and analyses should be taken, the average of which will generally represent more closely the quality of the coal delivered.

In this connection, we would draw attention to two interesting letters on the subject, "How to Buy Coal," Coal Age, Vol. 4, p. 866; and Vol. 5, p. 296. We hope that this important question will be taken up and further discussed by those whose experience in the purchase of coal for fuel makes their remarks of value to the producer and consumer alike.

Examination Questions

Mine Managers' Examination Held at Springfield, Ill. June 15, 1914

Ques.—If 50,000 cu.ft. of air is produced by a given power, in a circular airway 12 ft. in diameter, what quantity will the same power pass in an airway of the same length, 8 ft. in diameter?

Ans.—In this case, the airways being circular are similar. Then, the length of the airways being equal and the power constant, the quantity of air in circulation varies as the cube root of the fifth power of the diameter of the airways. In other words, the quantity ratio is equal to the cube root of the fifth power of the diameter ratio. Therefore, calling the required quantity of air circulated in the 8-ft. airway x, the power being the same in both airways, we have:

$$\frac{x}{50{,}000} = \sqrt[3]{\left(\frac{8}{12}\right)^5} = \sqrt[3]{\left(\frac{2}{3}\right)^5} = \sqrt[3]{0.1317} = 0.508$$

$x = 50{,}000 \times 0.508 = 25{,}400$ *cu.ft. per min.*

Ques.—An airway 60 yd. long, 5 ft. high and 8 ft. wide is full of firedamp. What quantity of air must be added (a) to render this quantity of gas explosive; (b) to make it reach the maximum explosive point; (c) to so dilute the gas as to render it nonexplosive?

Ans.—The cubic capacity of this airway is 3x60x (6x8) = 8640 cu.ft. The term "firedamp" refers to an *inflammable* or *explosive* mixture of air and gas; marsh gas (CH_4) undiluted with air is not firedamp, as it is an extinctive gas and not explosive. Assuming, however, that the meaning of the question is that this entry is full of marsh gas, and taking the volume of this gas as 8640 cu.ft.; (a) if air be added, the mixture will first become explosive when the proportion of gas to air is 1 : 5, assuming no other gas or dust is present. The required volume of air to produce this result is, therefore, $5 \times 8640 = 43{,}200$ cu.ft.

(b) The maximum explosive point, under the same conditions, is reached when the proportion of gas to air is 1 : 9.57. The required volume of air, in this case, is therefore $9.57 \times 8640 = 82{,}680$ cu.ft.

(c) Under the same conditions, the firedamp mixture becomes nonexplosive when the proportion of gas to air is 1 : 13. The required volume of air, in this case, is therefore $13 \times 8640 = 112{,}320$ cu.ft.

Ques.—If the total air pressure upon a ventilation door is 400 lb. when the water gage is 2½ in., what is the area of the door on which this pressure is exerted; and what is the height of the door when its breadth is 5.5 ft.?

Ans.—Assuming the given water-gage reading is taken on the door, the indicated difference of pressure between the two sides of the door is $2.5 \times 5.2 = 13$ lb. per sq.ft. If the total pressure exerted on the door is 400 lb., the area pressed is $400 \div 13 = 30.77$ sq.ft. The height of the door is, therefore, $30.77 \div 5.5 = 5.59$, say 5 ft. 7 in.

Ques.—Of two airways of equal length, which will pass the greater quantity of air under the same pressure; one of these airways is 8x8 ft. in section, and the other 4x16 ft. in section? Give the reasons for your answer.

Ans.—These airways have the same sectional area (64 sq.ft.), and their lengths being equal, the quantity of air in circulation under the same pressure varies inversely as the square root of the perimeter of the airways. In other words, the quantity ratio is equal to the square root of the inverse perimeter ratio. The perimeter of the first airway, which is square, is $4 \times 8 = 32$ ft.; and that of the second airway, $2(4 + 16) = 40$ ft.; and the ratio of the quantities of air passing in these airways is therefore:

$$\frac{q_2}{q_1} = \sqrt{\frac{o_1}{o_2}} = \sqrt{\frac{32}{40}} = \sqrt{\frac{4}{5}} = \sqrt{0.8} = 0.894$$

The ratio of air passing in the first airway to that in the second airway is, therefore, 1 : 0.894; or, for every 1000 cu.ft. of air passing in the first airway there is 894 cu.ft. passing in the second airway, under the same pressure.

The reason that the same pressure will pass less air in the second airway than in the first is that the second airway has a larger perimeter, and therefore a larger extent of rubbing surface, for the same sectional area of the airway.

Ques.—(a) What angle is included between N 60° E and N 25° W? (b) What angle is included between S 20° W and N 70° W?

Ans.—(a) The given bearings, in this case, being each measured from the north end of the meridian and lying in different quadrants on opposite sides of the meridian, the angle included between them is $60 + 25 = 85$ deg.

(b) In this case, the first bearing given is measured from the south end of the meridian, while the second is measured from the north end; and, both of these bearings lying on the same side of the meridian, the angle included between them is found by subtracting the sum of their angles from 180 deg.; thus, $180 - (20 + 70) = 90$ deg.

Ques.—Give the names, chemical symbols and composition of the different gases met with in coal mines.

Ans.—The most common mine gases are the following:

Methane or marsh gas; symbol, CH_4; comp., 1 atom carbon, 4 atoms hydrogen.

Carbon monoxide; symbol, CO; comp., 1 atom carbon, 1 atom oxygen.

Carbon dioxide; symbol, CO_2; comp., 1 atom carbon, 2 atoms oxygen.

Hydrogen sulphide; symbol, H_2S; comp., 2 atoms hydrogen, 1 atom sulphur.

Olefiant gas; symbol, C_2H_4; comp., 2 atoms carbon, 4 atoms hydrogen.

There are, besides, the gases forming the atmosphere; namely, oxygen and nitrogen, in more or less definite proportions.

CORRECTION—Attention has been called by readers to an oversight in failing to complete the answer to Question 12 of the Pennsylvania Bituminous Examination, May, 1914, COAL AGE, June 20, p. 1025. The value of one-half the water gage is given as 5.1 in. To this answer should have been added

$$w.g. = 2 \times 5.1 = 10.2 \text{ in.}$$

Coal and Coke News

Washington, D. C.

It is now practically established that the decision of the Interstate Commerce Commission in the 5 per cent. freight rate advance case will be handed down by the time this issues from the press. Of course, there is always a possibility that unexpected circumstances may intervene to prevent the carrying out of the program in regard to this case, as has so often happened in the past, but the present prospect of such a failure seems small—less than on any previous date.

While many rumors are in circulation, there is no reason to doubt the essential accuracy of the forecasts already made with regard to the case. These indicate that there will be some moderate advances on the more expensive articles of freight which move in large quantities. On the bulky commodities which furnish the basis of freight tonnage there will be no advances.

Conspicuous in the latter class of items, it is now understood, will be coal and ores. From the start there has appeared to be little warrant for any belief that an advance in these articles will occur. The commission and its counsel have shown a consistent indisposition to advance rates on coal and this has been borne out in a good many of the minor decisions that have come forward from time to time, in which the coal rates are involved:

A refusal by the commission to advance rates on coal will not, according to expectations, be the last of this matter, as coal operators have indicated a definite determination to secure a reduction of the charge made by the railroads in the anthracite regions and the Department of Justice is apparently committed to that course of action. Bituminous rates are already considered by many to be higher than they should be. Both in the matter of coal and of other articles in the same class it is to be expected that the rate controversy will go on, without reference to the actual findings in this particular case.

Larger Appropriation Is Asked

Working for the increased appropriation for which the Bureau of Mines has made request, Director Holmes has just given elaborate testimony before the House Committee on Appropriations, with a view to convincing that body that the extra $100,000 suggested should be granted. Mr. Holmes stated that he particularly wants this money for the study of waste in smelting and for the ascertainment of the best use to be made of gases from the smelters. He said that the gases contained primarily sulphur and arsenic, one smelter in Montana thus throwing out into the atmosphere many tons a day.

"The damage is extending for miles around," added Dr. Holmes. 'In the case of another smelter in California the damage can be traced 25 miles where the drift of the wind is constant for a considerable period of time, and the area is extending. We have demonstrated how to take care of arsenic and the metalliferous materials given off in small quantities, such as lead fumes and that part of the sulphur given off in the form of sulphuric acid, which is decidedly injurious.

We have found cases of damage from the arsenic, from the lead and from other metallic fumes. About the smelter itself, where the employees of the company operate, most of the damage done has been from the lead and arsenic gases. The policy we have pursued is the proper one to follow, that wherever it was feasible to do so investigations of this kind which were totally local in their character, should be paid for by the companies themselves rather than by the Government.

In connection with the smelter investigations there were certain problems which the smelter companies have practically declared to be unsolvable, and they did not think they ought to be called upon to spend money to solve problems which they did not think could be solved and which apply to other smelters as well as to themselves. Of the appropriation last year for this general work we have expended in all for smelter work $15,000. Wherever the problem was at all a local one we have required the smelter company to do the investigating. We have selected the men and we have mapped out the line of examination which we thought should be followed, but every dollar of expenditure and the employment of the men and the handling of the moneys has been entirely within the hands of the smelters.

What we do is entirely laboratory investigation on our part to determine, primarily with reference to sulphur gases, what can be done.

Dr. Holmes also made mention of the use of an invention by a Government employee which by virtue of the use of metal plates charged with electricity produced a deposit eliminating smoke.

It is now being used in smelter operations in various ways, he said. It is being used to take the arsenic out of the smelter gases as refined arsenic. It is being used in connection with petroleum in California, where the petroleum becomes so thoroughly mixed with water that it forms an emulsion so that the water will not separate from the oil by gravity.

It has been tested by several smelter companies to such an extent that they are now actually installing large scale plants for such purposes. Another interesting application was in southern California, where two large cement plants in the center of orange groves were destroying them. They prevented the dust from leaving the stacks.

With the expenditure of $15,000 we have this year conducted the more abstract of these investigations, which could not be considered local in this character. Three of the smelters, under our general advice, are conducting investigations, each one of which costs practically as much as the amount we are spending. It seems our duty to get other people to bear these burdens just as far as feasible. We handle none of the money of these smelter companies; we plan the investigations and select the men to do the work and watch the results.

Dr. Holmes was asked by members of the committee about the waste of sulphuric acid.

The only possible use for this acid, he said, will come when it can be collected, and its collection involves the storage of an enormous quantity. Unless there is a market for sulphuric acid, there should be the question of storage, and it would be leaking into the streams, which would be just as vigorously opposed as turning the gas loose in the atmosphere. What we are trying to do is to find some means of collecting it as sulphur in the form of a solid, so that it can be compressed into cakes; then it can be stored without any difficulty or loss in storage.

Sulphuric acid is used in a good many manufacturing operations in the East, but the supply comes in the main from Sicily, because the cost of transportation from the West makes its price greater. Nevertheless, we are trying to get some of the larger smelter companies to go into not only the manufacture of sulphuric acid but also of the phosphates.

Dr. Holmes mentioned other lines of investigation—such as safety and waste investigations in certain metallurgical plants, like those for the extraction of silver and gold.

He asked for an additional appropriation of $20,000 for the next year. It is especially desired to use this money, he explained, with reference to investigating the explosives used in metal mining and quarrying. In metal mining, he said, they want quick action, because they want to shatter the ore or rock, but they do not care anything about low temperature. What they want is an explosive that will produce the minimum of poisonous gases, because, as he said, in metal mining there is no such extensive ventilation system as in coal mines.

Poisonous gases, he explained, came from the powder used, decidedly injuring the men until they finally became unfit to work. To instruct them pictures were being used, he told the committee, because most of the men did not understand English. With each picture is a line or two in four different lauguages. "By that means we get them to understand the meaning of these lectures," said Dr. Holmes, "and we have been quite successful in bringing out the entire attendance of the miners. They will come to see the pictures and then try to learn all about safety projects. We would be still more effective if we could afford to use moving pictures."

HARRISBURG, PENN.

An action in equity which will raise the question whether men who have not had five years' experience as practical miners are eligible to receive certificates as mine foremen or assistant mine foremen, was brought in the Dauphin County Court, this city, on June 24 by James J. Moran and James B. Reilly, Pottsville solicitors for James Mathews president of district No. 9 of the United Mine Workers.

The action is to restrain James E. Roderick chief of the Department of Mines from issuing certificates to any of the 139 miners who may be returned as having passed the examination for certificates held at Pottsville May 25 and 26. It is contended that some of the applicants were not eligible to take the examination and will lay before the court the dispute whether men can be given certificates without having worked for five years.

PENNSYLVANIA

Anthracite

Plymouth—Operation at Dodson No. 1 colliery, Plymouth Coal Co., has been entirely suspended and the mules hoisted. The custom was to take the mules out daily from all workings except the Red Ash or lower vein. All hands have been suspended except those necessary for the safety of the property. The closing by injunction of certain sections of the mine made it too expensive to operate the Red Ash vein alone, hence the suspension.

Dunmore—When a car of coal being hoisted to the breaker of Grove Colliery of the Pennsylvania Coal Co. got beyond the control of the nippers and ran into the heavy gearing apparatus on June 24, work at the colliery was suspended, which threw 500 men and boys out of employment for the day. It was expected that the damage done by the car would be repaired at once so that work could be started at an early date.

Centralia—Centralia is gradually settling down into the mines or at least the entire west end of the town is so doing. Some few years ago there was a large cave-in on the main street, now the streets east of Troutwine are gradually settling and the people are getting worried. For the past two years a slight settling has been noticed and on June 26 the residents of Troutwine and other streets west were busily engaged in raising their homes, they having sunk almost 3 ft. in that time.

Bituminous

Ellsworth—This town will be the scene of a big Fourth of July celebration the plans for which have been worked up by E. E. Bach, sociological superintendent of the Ellsworth Collieries Company.

Honesdale—Indications of coal have been discovered on the farm of David McGraw, and a prospector has been employed to ascertain the extent of the deposit, if any exists.

Hastings—Current from the Penn Central Light & Power Co. was recently turned into the workings of the Pennsylvania Co., known as mines Nos. 11, 12 and 13. In addition to supplying the mines, however, the town of Hastings will be lighted by the central station company.

Fayette City—Fire on June 25 destroyed the stables of the Pittsburgh Coal Co. and two dwellings at Nauvoo Hollow, near Fayette City. The loss, which was partly covered by insurance, is estimated at $7000.

WEST VIRGINIA

Wheeling—By a majority of 6, the miners of the Mound Coal Co., who have been on strike for some time, on June 26 voted to return to work. The vote was on the question of whether or not the men would return to work without the bonus which the operators had been paying. A committee was apointed to ask that the miners be permitted to have a check weighman, and also that the company repair its screens, which are claimed to be in a bad condition. It is likely that both propositions will be granted.

Charleston—Part of the vote of the miners of the Kanawha district as to whether they will accept the second proposition offered by the federal mediators in the strike settlement was rejected June 26 by officials of district 17, and went back to the local unions for correction. The officials claim they found illegalities in the vote of 19 of the locals in the district. This action postponed settlement of the strike.

About 150 miners of the Milburn Coal Co., on Paint Creek, who had been working pending an adjustment of the disputes between operators and men in the Kanawha field, struck on June 24, on account of the continued failure of the factions to reach an agreement.

Fairmount—On the afternoon of June 23 a fire was discovered in the main dip heading at the Barnesville shaft of the Consolidation Coal Co. All men and animals were immediately removed from the mine, and fire apparatus and helmet men from adjoining developments hurried to the scene. The latter spent the night in fighting the flames, the origin of which could not be determined.

KENTUCKY

Pineville—A jury in the Bell County, Ky., Circuit Court returned a verdict recently for $20,000 as damages against the Coleman Coal Mining Co. in the case of James Aslinger's administrator against that firm. Aslinger was killed while at work in the mines of the defendant company. The case will go to the Appellate Court of the state.

Whitesburg—The Consolidated Coal Co. has put 200 additional negro miners at work in the mines around Jenkins and McRoberts. All the mines are now running full time.

Henderson—Sugg & Sights, L. S. Jackman and others, announce the sale of several thousand acres of virginia coal lands in the Hebbardsville, Zion and Niagara districts to outside capitalists. Names are withheld, but it is stated that the new owners will develop the properties at once.

Louisville—Coal operators in this vicinity are making extensive preparations for the meeting on Aug. 18 to 20 of the National Commissary Managers' Association. The programs of the various sessions will be educational with addresses by noted merchandising experts, stereopticon lectures showing ideal store arrangements, attractive disposition of stock, etc.; symposiums dealing with methods of building up commissaries, the evolution of commissary managers from clerical positions to executive posts and specific ways in which the ambitious commissary manager can increase his efficiency.

OHIO

Cincinnati—Charles W. Poysell and Edward Marmet, receivers of the Marmet Coal Co., were recently granted permission to give an option upon the entire assets of the coal company to New York parties for one million dollars. The business is to be continued as a going concern by the receivers.

Columbus—Word comes from certain parts of the Hocking Valley mining district to the effect that many of the rank and file of the miners' organization are opposed to the methods employed by the union in distributing strike benefits. Since the start of the suspension, April 1, only $6 per man has been paid as strike benefits. These men will insist that their assessments be distributed in their local district.

Lowellville—It is announced that the Lowell Coal Co., whose mines have been idle for the past two months, will resume operations shortly, as soon as the installation of a quantity of new electrical equipment is completed. The plant will be one of the best equipped in the state when this installation is ready for operation.

INDIANA

Brazil—The engine house and tipple of the Progressive mine, south of Brazil, were recently destroyed by fire, the loss being about $3000, with no insurance. This mine has been abandoned for some time.

The Crawford Coal Co. is sinking a new mine north of this city. It will give employment to 200 men.

Shelburn—The Reliance mine, one o fthe largest in Indiana, will be reopened shortly, after a shut-down since April.

Jeffersonville—The assessment against the Monongahela Consolidated Coal & Coke Co. shows a large falling off, due to the removal of several floats and much cable and machinery to Cairo, Ill. The stock of coal in the local harbor is also less than a year ago.

Washington—George Trowbridge, of Bicknell, Ind., has bought the Elnora mine and will extend its development.

Evansville—The Deepwater Coal & Coke Co., which recently took options on a large number of mines in southern Indiana and western Kentucky, is now surveying the Sebree mines at Sebree, Ky.

ILLINOIS

Pana—Following a hearing of the suit in the Circuit Court, Judge James McBride ordered Master in Chancery James Brennan to sell at foreclosure all properties ,mines and machinery of the Pana Coal Co. This company was placed in the hands of receivers last fall as the result of suits filed by Farson & Co., Chicago bankers, for interest due on bonds. The bonded indebtedness of this concern is placed at $219,000; unpaid interest, $20,718.50; receivers' certificates and expenses, $25,000; receivers' and attorneys' fee, $15,000.

Princeton—Arrangements have been made for the opening of the mine at Marquette in the near future. A new company has been formed under the name of the LaSalle-Hennepin Coal Co. to operate this mine, which was closed down some time ago by order of the state mining board. The new company expects to put the mine in shape to conform to the state laws, and begin operation.

Glen Carbon—No. 2 mine of the Madison Coal Corporation will shortly be operated to its full capacity. This mine has been opened and a force put to work cleaning it up. It is expected that 200 men will be employed, and that probably 2000 tons a day will be taken out for a while, but it is anticipated that this will be increased shortly to 3000 tons.

KANSAS

Pittsburg—The Chapman Coal Co. will shortly install self-rescuers in its mine No. 5. The apparatus will be worn by shot-firers in the performance of their work.

ARKANSAS

Russellville—The improved situation in Arkansas has resulted in resumption of operations by a number of mines. The Russellville anthracite mines have resumed work, while several smaller ones are tuning up for full-time operations.

COLORADO

Louisville—Charles C. Welch, F. W. Loveland and Henry B. Teller, directors of the Louisville Mining Co., have been sued in the District Court at Boulder by Charles A. Campbell for $1650 damages for alleged undermining of his property, causing his store building, located near the main part of the city, to sink.

WYOMING

Cheyenne—Alleging that the Wyoming Coal Co., operating in Sheridan county, has defaulted interest and failed to keep its mortgage contract, and is about to default in its pay-roll, the Continental Trust & Savings Bank, of Chicago, has applied to the United States District Court for the appointment of a receiver.

WASHINGTON

Douglas County—A supposed coal deposit recently found 35 miles east of Roseburg has been reported upon by Ira A. Williams, of the Oregon Bureau of Mines, and was found to be obsidian or worthless volcanic glass. Over 20 claims had been filed and considerable work done.

FOREIGN NEWS

Piedras Negras, Mexico—A demand for the payment of $100,000 in gold has been made of the Aguila Coal Co. by constitutionalist officials. If this money is paid, it is announced that threatened confiscation of the property will be temporarily deferred. All efforts of American and French stockholders, owners of coal mines confiscated a month ago, to recover their property have failed.

TRADE CATALOGS

The J. C. Stine Co., Tyrone, Penn. Bulletin No. 18. Twenty eight pages 8x9½ in. illustrating and describing Stine fans, engines and pumps.

Western Electric Co., 463 West St., New York. Catalog. Western Electric inter-phones and accessories. Illustrated, 48 pages, 7½x11 in.

Pawling & Harnischfeger Co., Milwaukee, Wis. Bulletin No. 301A. "The Application of the Electric Hoist." Illustrated, 8 pages, 6x9 in.

Ottumwa Iron Works, Ottumwa, Iowa. Catalog No. 30. Electric and steam hoisting engines and mine equipment. Illustrated, 116 pages, 7½x10 in.

The Mesta Machine Co., Pittsburgh, Penn. Bulletin "O." "Mesta Rope Drives." Eigh pages, 6x9 in., illustrating and describing rope transmission machinery.

The Martin-Hardsogg Co., Pittsburgh, Penn. "Distinctive Mining Tool Makers." Catalog "H." Seventy-eight pages, 7x10 in., describing mining tools and supplies.

The Mesta Machinery Co., Pittsburgh, Penn. Bulletin "N." "Air Compressors and Vacuum Pumps." Eight pages, 6x9 in., illustrated with drawings, diagrams and halftones.

The National Stoker Co., Covington, Va. "Crowe Stokers." Thirty-two pages, 6x9 in., with numerous drawings and illustrations, showing installations of Crowe chain grate stokers.

Edward Darby & Sons Co., Philadelphia, Penn. "Expanded Metal and Ventilated Sheet Lockers." Leaflet of 8 pages, illustrating and giving general specifications of Pen-Dar metal lockers.

The Sullivan Machinery Co., Chicago, Ill. Bulletin No. 63M, replacing Bulletin 63H. "Sullivan Iron-Clad Coal Cutters." Thirty-six pages, 6x9 in., illustrating iron-clad coal-cutters and their usage in coal mines.

The Electric Storage Battery Co., Philadelphia, Penn. Bulletin No. 146, May, 1914. "The Iron-Clad Exide Battery for Storage Battery Locomotives." Eighteen pages, 9x11 in., illustrating and describing storage batteries for locomotives.

Weston Electrical Instrument Co., Newark, N. J. "Experimental Electrical Testing by Students." Seventy eight pages 6x9 in., illustrating various electrical tests and apparatus. The book is compiled for and is of especial value to science teachers.

The Atlas Power & Manufacturing Co., of Cleveland, Ohio. Bulletin No. 1155. "Storage Battery Locomotives." Nine pages, 6x9 in., illustrating and describing various sizes and types of storage battery locomotives, particularly adapted to mine usage.

The Atlas Car & Manufacturing Co., Cleveland, Ohio. Bulletin No. 1165. "Electric Side, Rotary, and Rocker Dump Cars." Pamphlet of 8 pages, 6x9 in., illustrating and describing self-propelled dump cars, particularly applicable to slate disposal at mines.

PERSONALS

C. M. Means, electrical engineer, of Pittsburgh, Penn., has been apointed consulting electrical engineer with the U. S. Bureau of Mines.

J. R. Crowe, head of the Crowe Coal Co., operating mines at Pittsburg, Kan., will leave shortly for a tour of Europe. Mr. Crowe intends to inspect a number of mines while abroad, though the trip will be primarily for pleasure purposes.

George D. Key, candidate for attorney-general of Oklahoma, is making promises of putting the alleged "coal trust" out of business. Mr. Key, in recent speeches, has attacked the McAlester Coal Co. and others, alleging that operators have conspired to mulct the consumer.

Joseph Elwood, for several years with the Pittsburg & Midway Coal Co., at Pittsburg, Kan., has resigned to become general manager of the P. R. Sinclair Coal Co., of Aurora, Mo. He will have charge of the marketing of the company's output, with offices at Pittsburg, Kan.

Governor Cox, in a statement issued recently, denies that he will bring to the attention of the special session of the Ohio General Assembly the question of amendments to the Green mine-run law. He says the special session is called for taxation legislation, and nothing else will be taken up.

H. D. Mason, Jr., who has been in charge of the government mine rescue car at Pittsburg, Kan., for the past year, has been transferred temporarily to Pittsburgh, Penn., succeeding J. W. Paul, engineer-in-charge, who will leave shortly for an inspection tour of European mines. K. H. Chisholm probably will be transferred to Pittsburg, Kan., from McAlester, Okla., pending Mr. Mason's return. A. I. Young will be in charge of the car at Pittsburg.

Russell G. Belden and A. Eugene Wayland, of Spokane, Wash., who were recently convicted of using the United States mails to defraud, in the promotion of coal-mining companies, have been sentenced by Federal Judge Frank H. Rudkin to imprisonment, Belden's sentence being confinement in the federal prison on McNeil's Island for one year and one day, and Wayland's six months in the Spokane county jail. A stay of judgment, however, was granted, and the men were allowed to have their liberty on bail, pending an appeal to the United States Appellate Court at San Francisco.

James Taylor, formerly Illinois state mine inspector, now of the Draeger Oxygen Breathing Apparatus Co., of Pittsburgh, Penn., who was on a visit to Kincorth, Saskatchewan, Canada, on hearing of the coal-mine disaster in southwest Alberta, hurried to Hillcrest. After having made a careful study of the work done in connection with efforts at mine rescue on that occasion, he states that the men from the rescue stations of both Alberta and British Columbia did splendid work in recovering the bodies of those killed by the explosion, although there was no opportunity to get men out of the mine alive, death having overtaken them almost immediately.

OBITUARY

August Diehl, a former coal operator, died at Fulton, Mo., on June 22, after a short illness. Mr. Diehl retired from active business several years ago. He was 72 years old and a native of Germany.

William Guest, aged 78 years, one of the pioneer colliery engineers of the Lackawanna Valley, who died on June 23, in Scranton, could boast of never having experienced an accident in over 50 years of service at the Pyne shaft. He was employed by the Lackawanna Coal Co. for 51 years.

CONSTRUCTION NEWS

Waynesburg, Penn.—John Bender and John Zubal are preparing to open a mine in the Mapletown vein of coal under the McNatt farm in Cumberlad Township.

Nashville, Tenn.—At a cost of $5000, the St. Bernard Mining Co., George C. Atkinson president, is erecting a corrugated iron paint shop here, using its own employees.

Fairchance, Penn.—Arrangements have been made for the opening of two coal mines near Fairchance. The 9-ft. vein of coal will be worked, a contract having already been made for the coal mined.

Columbus, Ohio—Negotiations have been completed by the National Coal, Fuel & Supply Co., which has offices in the New Hayden Building, Columbus, for the purchase of a tract of 3200 acres of coal lands in Buchannon County, Va. The consideration is approximately $288,000. The load was purchased from the Roanoke Land Co. and the local corporation proposes to develop it in the near future.

Whitesburg, Ky.—Real estate, coal and timber land values have gone up in the lower end of Letcher County since the announcement was made that the Wasioto & Black Mountain R.R. would be extended from Benham, Harlan County, through Pine Mountain and down Pine Fork Creek. A crew of engineers is on hand preparatory to making the survey, and it is declared that construction work will be begun at once. The extension, which will run about 16 miles, will mean expensive tunnelling and grading and will open up an exceedingly rich country.

Toledo, Ohio—The $2,000,000 dock and harbor improvement of the Hocking Valley Ry. Co. at this point is nearing completion. It will be one of the most important pieces of dock and pier improvement in this section and will put the Hocking Valley foremost among railroads handling coal on the Great Lakes. The two loading machines, one of which has been completed and the other to be finished by Aug. 1, will be the largest in service on the lakes. They will be capable of handling 40 cars each of 50-ton capacity per hour, and can load the largest coal boat on the lakes in 6½ hours. During a season of navigation they can handle 10,000,000 tons of coal.

NEW INCORPORATIONS

St. Clairsville—The Big Five Coal Co. has reduced its capital stock from $300,000 to $6000.

Vincennes, Ind.—The Wasson Coal Co. has increased its capital stock from $150,000 to $175,000.

Carbon Hill, Ohio—The Russell Run Coal Co. has increased its capital stock from $10,000 to $20,000.

Bridgeport, Ohio—The Pursglove Coal Mining Co. has made a reduction of capital stock from $100,000 to $5000.

Matoka, W. Va.—The Delparen Briquet Co. has been incorporated with a capital stock of $100,000 to manufacture briquets for fuel

Liberal, Mo.—The Liberal Coal & Mining Co. has been formed to operate a steam shovel at Liberal, Mo. J. H. Vincent, a mining engineer, of Pittsburg, Kan., is the head of the new concern.

Gary, Ind.—The Mid-West Diamond Drilling Co. has been organized with a capital stock of $20,000. The business of this firm will be mining. The directors are William L. Brennan, James B. Brennan and John A. Brennan.

Skelton, W. Va.—The West Virginia Coal Mining Co. has been organized for coal development with a capital stock of $50,000. The incorporators are T. R. Ragland, of Skelton, W. Va.; K. L. Moon, E. F. Simpson, M. L. Norvell and W. M. Beckers, Jr., all of Richmond, Va.

Peel Tree, W. Va.—The Little Mountain Coal Co. has been granted a charter. The chief works of the new concern will be at Peel Tree. The organization is capitalized for $500,000, $5000 of which has been subscribed and paid in. The firm will do a general coal mining business

Henderson, Ky.—The Kentucky-Henderson Coal Co., with a capital stock of $425,000, has been incorporated by the following, all of 1137 Schofield Bldg., Cleveland, Ohio: J. A. Curtis, L. C. Mizer and W. H. Hill. Mr. Curtis is soon to announce the details of the developments the company will make.

INDUSTRIAL NEWS

Pottsville, Penn.—A peculiar situation recently developed in Pottsville. The town ran entirely out of nickels. The Philadelphia & Reading Coal & Iron Co. was handicapped in making up its payrools and the government was asked to ship $10,000 in nickels to the region.

Athens, Ohio—Howard Manington, representing the Ohio Electric Co., which has started the construction of a $1,000,000 power plant at Flodwod, Ohio, for the purpose of supplying electric current to mines in that neighborhood, is trying to make contracts with cities and towns for furnishing light.

Washington, D. C.—Investigation of charges that a "coal trust" is influencing coal-carrying railroads to discriminate against Atlantic ports south of Norfolk will be begun by the Interstate Commerce Commission early in July. Subpœnas have been issued for several prominent men connected with the interests concerned.

Charleston, W. Va.—In the hope that the state will be able to properly distribute labor, sending idle men to points where they are needed, J. H. Nightengale, commissioner of labor, recently announced that a free employment bureau will be opened. This action is taken under an act of the legislature passed in 1901, but never enforced.

Parkersburg, W. Va.—The Sylvester Co. has announced the removal of its business headquarters from Connellsville, Penn., to Parkersburg, W. Va., the object being to secure a more central location in the coal-mining district. The name of the firm is also changed from the Sylvester Co. to W. Sylvester. This, however, involves no change in ownership, management or policy.

Columbus, Ohio—The W. J. Hamilton Coal Co. has filed an answer to the petition, filed several days ago, asking the United States court to declare it bankrupt. The company denies that it is insolvent or that it is a bankrupt, and asks that the case be dismissed. The petition asking that the company be declared bankrupt was filed by the Buffalo Collieries Co. and others.

Philadelphia, Penn.—A protest has been made by the grievance committee of the Delaware, Lackawanna & Western R.R. mining employees against the patrol system recently inaugurated at the company's mines. This system was established in the interest of the workmen's safety and not, as charged, for the purpose of driving the men to work. The protest carried with it a strike threat, but this, it is believed, will be averted.

Birmingham, Ala.—The officials of the Tennessee Coal, Iron & R.R. Co. recently announced the receipt of an order for steel rails amounting to 32,000 tons from the Frisco line. This steel will be used in relay work, the construction of passing tracks and some new construction along its line. Steel plant operations, although not at the maximum, have been more or less satisfactory, and the belief is entertained that there will be but little idle time this summer.

St. Louis, Mo.—The Interstate Commerce Commission has ordered the Rock Island and Denver & Salt Lake railroads to establish on or before Sept. 1, and maintain for at least two years from that date, rates on bituminous coal from the Oak Hills district, Colorado, to destinations in Kansas, Nebraska and Missouri, not in excess of those contemporaneously in effect from the Walsenburg district to the same destinations. The railroads proposed to increase rates.

Pittsburgh, Penn.—The H. K. Porter Co. intends shortly to bring out a new type of locomotive, combining as practical features compact construction, vertical boiler, gasoline, kerosene or fuel-oil burner equipment, piston valves, outside valve gear and a condenser attachment to eliminate steam exhaust in mines and tunnels. Equipped with a gasoline burner, this locomotive gives absolutely no smoke or obnoxious gas in the exhaust, making it ideal for tunnel or mine service.

Seattle, Wash.—Four hundred tons of coal mined by the government in the Matanuska coal fields of Alaska for the use of the navy in making steam tests was recently brought by the steamship "Admiral Sampson." The coal was discharged at the Puget Sound Navy Yard, where it will be stored until the armored cruiser "Maryland," which has been selected to make the test, can be spared from service in Mexican waters. Four hundred and fifty tons of coal are still at Knik, Alaska, and probably will be brought down on the next steamer.

Coal Trade Reviews

General Review

Heavy curtailment in the anthracite regions marks the inception of the usual midsummer lethargy. Individuals working full and forcing the market. Eastern soft-coal buyers fail to respond to unusually low prices and trade devoid of further absorbing paver. Western situation developing a better tone.

The regular monthly increase in the anthracite circular on Wednesday of this week, has forced a heavy general restriction in operations throughout the mining regions for the first time this season. Many of the large companies shut down on Tuesday night and will remain closed until Tuesday morning of next week; the curtailment was of larger proportion than anticipated and marks the beginning of the usual summer dullness in the anthracite trade. The individual operators are attempting to work full time but are obliged to make heavy concessions on the circular, sales down to the April discount and even less being frequently made. The consumers are getting well stocked and the market has little further absorbing power. Stocks at the upper Lake ports are still excessive and will continue so until the crops begin to arrive but the Lake movement is about normal.

There is no life to the Eastern bituminous market in any direction. Buyers are indifferent to low prices, some exceptionally good offers failing to move tonnage and the trade appears to be completely devoid of further absorbing power. With many of the manufacturing plants closing down on July 1, the midyear period, to take inventory and undergo a general overhauling, the indications are for a further curtailment, temporarily at least. The increased demand in the West for certain of the West Virginia grades has diverted some coal from the Eastern market but not sufficient to relieve the tension. The bunkering business at tidewater continues light but the foreign trade is proving excellent.

The Lake market still fails to develop the expected activity. A slight increase from the Pittsburgh district is noticed, but this is offset by a reduced consumption among manufacturing interests as a result of the customary mid-year shut down. The labor deadlock in Ohio is still in effect and seems to be more complete than ever before; indications now are that settlement will be effected by subdistricts. In the meantime current requirements are being obtained from outside sources and some improvement in the steam grades is noted with prices slightly stronger. The resumption of operations in the Kanawha field has had a depressing effect and surpluss tonnages are again accumulating. Steam fuels in the Southern market are notably firmer, industrial activity apparently being on the increase there; the higher grade domestic coals are also bringing a slightly better price.

The steam coals are reported generally stronger throughout the Middle West also. In spite of the many adverse conditions in different parts of the country the large Western crops are undoubtedly having a stimulating effect upon the situation there. There are quite a number of contracts still being held back but prices are well maintained and there will be a rush to close contracts at the first indication of any improvement. Mines as a rule are on about half time schedule.

ATLANTIC SEABOARD

BOSTON

Continued summer dullness. Fewer "market cargoes" the only hopeful sign. Prices show no improvement. A slightly better movement of Pennsylvania grades looked for in July. Anthracite consumers taking on very little.

Bituminous—There is no improvement in the tidewater situation. Pocahontas and New River prices continue as weak as at any time in June and there appears to be no life to the market in any direction. There are perhaps fewer cargoes of consignment coal to be forced on reluctant purchasers, but otherwise there are no hopeful signs to report. There are now practically no contracts left open and it is hard to see where any buying power can develop during July and August. What coal comes forward aside from "market" lots is almost exclusively for application to contract business and the volume of such business is much smaller than usual at this season. The amount of sail, barge, and team colliers laid up for lack of business has increased rather than diminished and beyond a few half-hearted appeals for "offers," the transportation people are reconciled to the general dullness and do not shade rates below what would yield some sort of return.

The amount of coal standing at the Hampton Roads piers continues to be very large. Spasmodic efforts are made here to move blocks of it beyond what can be shipped to regular contractors, but an ordinary "cut" proves as ineffectual as none at all. Buyers are now so callous to low prices that they have ceased to be responsive.

The Pennsylvania varieties will be helped a little by the slackening demand for anthracite. There was a reduction of 5c. in the water rate from Philadelphia on railway barges carrying bituminous temporarily, both for part and for whole cargoes. The movement should therefore be somewhat improved during July, particularly because many Eastern buyers wait for just such a situation. Prices are unchanged; operators are still obliged to name bottom figures on what tonnage they move.

There is no new feature in Georges Creek. What is mined is confined pretty well to contract and prices therefore show no weakening.

Anthracite—July opens with a small amount of tide orders held over from June and a fair prospect of business the latter part of the month. Meanwhile, the holidays in the region, are likely to cause curtailment of output, and a dull spell is looked for. Retail dealers are not favored with more than scattering orders from consumers and stocks in most parts of New England are well up to the limits of storage.

NEW YORK

Bituminous production still restricted and further curtailment anticipated. Stocks depleted and a moderately firm undertone prevails. First general suspension of the season becomes operative in the hard-coal regions.

Bituminous—A steadily increasing dullness charatcertizes the local soft-coal market. Negotiations on the new contracts have ceased entirely for the moment and practically no spot business whatever is being done. Production for the current week was about on the same reduced schedule as last week, but further curtailment is anticipated next week when many industrial concerns will close down for two weeks, taking inventories and giving their plants a general overhauling.

As has been the case for some time past, the movement is restricted entirely to contracts, and requisitions on these are much reduced. A moderately strong demand for gas coal in the West is relieving the tension on these grades in the Eastern markets to a certain extent. The West Virginia gas-coal operators are probably working close to full

rated capacity, while it is doubtful if the steam-coal mines are producing 50% of their possible output.

There is still a great deal of coal being held in boats to avoid demurrage which can possibly be obtained at concessions. Aside from this, there is no evidence of any consignment coal at Tidewater and no forced sales at sacrifice prices are being reported. The unusual condition of restricted operations with the Berwind Company still prevails, due no doubt to the adverse conditions in the bunkering trade, but as a rule the supplies at Tidewater are only normal. Probably no new contracts are being closed but some of the agencies have figures out on the same basis as last year. No business whatever is being done in the spot market but the prices remain quotable on the same basis as for the past several weeks as follows: West Virginia steam,, $2.50@2.60; fair grades Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The salient feature of the hard-coal market during the current week has been the general restriction in operation on the part of most of the big companies; many of them suspended operations Tuesday night and will remain closed until Tuesday of next week while all the others are curtailing to a certain extent. This is the first general suspension throughout the mining regions and marks the beginning of the customary summer dullness in the anthracite trade. That a restriction in operations has been imminent for some time was generally agreed to by all, but it was hardly expected to be of such large proportions. A combination of several conditions has made this necessary. There is scarcely any demand at the moment except for stove coal, and with the increase of 10c. in the circular on domestic grades on Wednesday, July 1, what little demand there was, practically all disappeared.

There is practically no demand on any of the sizes. Stove coal which has been in short supply throughout the season can now be had for reasonably prompt shipment in any desired tonnage. Pea and buckwheat are being stocked heavily. It is expected that the customary lethargy following the 10c. increase on the first of the month will prevail until well toward the close of the month when another spurt is expected. We now quote the New York market on the following basis with the circular on the prepared grades, increased 10c. per ton:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$4.90	$4.60@4.90	$4.85	$4.55@4.85
Egg	5.15	5.00@5.15	5.10	4.90@5.10
Stove	5.15	5.15	5.10	5.10
Chestnut	5.40	5.10@5.40	5.35	5.00@5.35
Pea	3.55	3.40@3.55	3.50	3.25@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.10@2.75
Rice	2.30	2.20@2.30	2.00@2.25	1.60@2.25
Barley	1.80	1.60@1.80	1.75	1.25@1.75

PHILADELPHIA

Market for anthracite growing more stagnant. No immediate improvements indicated. Bituminous situation slightly more encouraging, but it is still difficult to negotiate a sale even at the low prices prevailing.

Anthracite—The anthracite situation still continues to slow up as the summer progresses. Continued inactivity in the industrial field has reduced the demand for the small sizes to such an extent that most of the output is being placed in stock. The domestic market is absorbing all the stove coal, but on the other sizes, short-time work at the mines is sufficient to meet all requisitions. Tidewater business is gradually disappearing. Individual operators still continue to work their mines on full time, and buyers are quoting their own figures. Quotations of $2.10 and $2.15 for pea coal, without the tax, are freely made, and April prices or in some cases less, are the rule rather than the exception. The price of stove is about the only figure that is being maintained, and a comfortable order for chestnut will have a tendency to reduce this also.

Tidewater prices rule about as follows:

	Circular	Individual
Broken	$4.55	$4.55
Egg	4.80	4.60 @ 4.70
Stove	4.80	4.80
Chestnut	5.05	4.70 @ 4.80
Pea	3.25	3.00

Bituminous—The bituminous market still continues, as a whole, dull and listless. With the exception of possibly an increased demand, due to the fact that some of the manufacturing establishments have had to replenish their stocks to a certain extent, there is little change over the previous week. Prices for the medium coals are still quoted at from 90c. to $1.10 and the better grades $1.25 to $1.35, with considerable effort attached to making sales at even these figures.

BALTIMORE

Industrial troubles in the West are stimulating West Virginia prices. Eastern business continues slow and quiet. Export trade holds steady and firm.

The West Virginia situation on soft coal is being materially helped by strike troubles in some of the Middle West states. Not only are prices better for delivery West, but the mine interests are showing more of a disposition to withdraw from the poor trade Eastward. Hurry calls for coal to the West to take the place of Ohio fuels have resulted in sales of three-quarter gas at from $1 to $1.05 for prompt delivery, while the same fuels East have been quoted at a maximum of 85c. Slack, too, is doing better Westward, sales being quoted at anywhere from 65 to 75 cents.

Pennsylvania fuels have felt the effect of the Western demand to a less marked degree, the increase being largely confined to districts which have always participated in this business. Pennsylvania coals of medium grade are quoted at from $1 to $1.10. Best fuels are still firm around $1.35, on spot business. The Eastern business as a whole is rather slow and uneventful.

HAMPTON ROADS

Demand for all grades still light. Practically no coal moving except on contract. Circular prices still being quoted.

Dumpings for the week have not been heavy. There have been times when berths at all piers were vacant, although vessels have been compelled to remain in the stream awaiting turn at the dock. Taking the week as a whole, the total dumpings will just show a fair average.

Practically all coal shipped has been New River and Pocahontas run-of-mine, with some small lots of high volatile. Some coal has moved to the Southern ports, but the heaviest coastwise shipments have been to Boston, Providence, Portland and Fall River.

Quotations remain the same as they have been for some time, and, although there may be some little cutting by smaller concerns who have coal on demurrage, it is not believed any great reductions will be made in circular prices. There is still more coal in the railroad yards than normal, with a fair amount of vessel tonnage about due.

Foreign shipments for the week have been to Naples, Genoa, Leghorn, Coronel, Punta Arenas, St. Lucia, Port of Spain, Santiago, Barbadoes, Para, Pernambuco and Cerea. From present indications, dumpings for June will fall considerably behind those for May, but the prospects are there will be an increase over the figures for June of last year.

SEABOARD SHIPPING

The "Journal of Commerce and Commercial Bulletin" reports coal shipping, under date of July 1 as follows:

An active business was done in steamer chartering for grain cargoes, the bulk of which was for Montreal loading. Additional freights of the kind offer steadily for July, August and September loading, and rates are strong and buoyant, with tonnage offerings limited. The demand for tonnage in all other trades was limited and but little was done in chartering. There was no change in the sail tonnage market and nothing of consequence was done in chartering. Tonnage is abundant and offers freely, but business of all kinds is difficult to obtain. Rates are nominal and not quotably altered.

Coal charters have been reported as follows:

Vessel	Class	Nationality	From	To	Tonnage
Camilla	Steamer	Norwegian	Baltimore	Bocas del Foro	1530
Ocland	Steamer	Norwegian	Baltimore	Daiquiri	1874
Estelle Krieger	Schooner		Philadelphia	Porto Rico	1047
Augustus D. Babcock	Schooner		Norfolk	Texas City	1299
Kineo	Schooner		Hampton Roads	Texas City	1867
Chas. Whitemore	Schooner		Baltimore	Georgetown, S. C.	582
Henry W. Cramp	Schooner		Philadelphia	Bangor	1448
	Steamer		Atlantic Range	Yokahama	6000
Auchemblae	Steamer	British	Baltimore	Vera Cruz	2500
Putney Bridge	Steamer	British	Baltimore	Vera Cruz	2147
Henry Lippitt			Philadelphia	Cay Francis	

COKE

CONNELLSVILLE

A notable firming up in coke. Large contract placed at $2. Foundry grades dull at expiration of contracts.

The coke situation has firmed up decidedly, as three consumers have just placed contracts for second-half furnace coke at $2 flat, involving a total of 27,000 tons a month. One of these consumers is in the East, another in local territory and the other in the West. As prompt coke can be had at well under $2 it is inferred that the buyers expected a considerable firming up in the market in the near future. There is also indicated a stronger preference on the part of buyers for the best grades, as there are some brands of coke rather freely offered at about $1.85 for third-quarter and $1.90 for the half-year.

Prompt furnace coke is as dull as ever. Several contracts for second-half are under negotiation with sellers who are committed to a price of $2. Foundry coke is rather dull, considering that most contracts expire this week. The market is quotable as follows: Prompt furnace, $1.75@1.80; contract furnace, $1.90@2; prompt and contract foundry, $2.30@2.50, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ending June 20 at 262,575 tons, an increase of 2960 tons, and shipments at 260,265 tons, an increase of 6913 tons. This is about 60% of the normal capacity of the region.

BUFFALO

Still dull and heavy, with some low prices being quoted.

The ovens are still reducing their active number, and though there is occasionally report of a firmer and more active steel market it does not affect coke. There is at present a report of coke selling at low prices, but the producers of standard grades are holding firm on the basis of $4.25 for best 72-hr. Connellsville foundry and $3.25 for stock coke.

COLUMBUS

The coke market is ruling steady in every particular. The demand is not strong and offerings are also small. Prices are firm at the figures which have prevailed for some time.

CHICAGO

The market is firm. Prices are: Connellsville and Wise County, $5@5.25; byproduct, egg, stove and nut, $4.65; gas house, $4.25.

ST. LOUIS

In June 1913 an unusually large tonnage of coke moved into St. Louis, but this season practically none has arrived from outside points. Some local coke was distributed, but not in the tonnage anticipated. A good demand is looked for in July.

LAKE MARKETS

PITTSBURGH

Mining operations unchanged at about 75% of nominal capacity. Lake movement fairly heavy, but market sales of Lake coal very light. Prospective closing of mill consumers in July. Price shading for prompt slightly diminished.

Mining operations in the Pittsburgh district continue at about 75% of nominal capacity, though at perhaps not over 60% of the possible capacity under pressure. There has been a slight further increase in shipments in the Lake trade, but this is more or less offset by small line trade since many of the mills and factories contemplate closing for a short time in July for repairs.

While the Lake movement on the whole is fairly large in tonnage, though well behind the movement of last year to this date, the proportion of coal passing through the local market for Lake shipment is small. Nearly all the coal being shipped in the Lake trade is by Lake shippers which have their own mines, or long-term arrangements with mines. There is somewhat less cutting of circular prices in the case of prompt coal, but there remains considerable, and particularly on slack. which sells down to 55c.. and possibly 50c. in some instances. Circular prices remain: Slack, 80@90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in.. $1.50. per ton at mine. Pittsburgh district.

BUFFALO

Some report of improvement here and there, but it is not general. Anthracite at full mid-summer quiet. Mines all running on part time.

Bituminous—A few of the local shippers claim to see better things in the trade, but as a rule there is no improvement. Slack has been hard to dispose of, but some shippers now report that they have sold all their surplus. It is also stated that some of the larger producers of slack are stocking considerable rather than sell it at present prices.

In spite of the uniformly slow movement of bituminous there are some who are preparing for a stir. There are a few mine owners and representatives who are able to keep their mines running practically all the time and sell their coal at good prices, but the rule is about three or four days' operation a week, and more or less difficulty in disposing of even this reduced output. The buyers are in the market only on solicitation. Bituminous prices are quite as steady as the amount of coal moving will warrant, being based on $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with Allegheny Valley 15c. to 25c. lower.

Anthracite—The trade is quiet, with no stir expected till after the midsummer lull is over. There is no real complaint, as in bituminous, for what is not sold now will have to be taken later. The actual consumption has not fallen off and is not likely to diminish so long as the supply lasts. Mining is slowing down, on account of the general lack of demand.

The Lake trade keeps up remarkably well, in view of the general notion that the Upper-Lake docks are largely overloaded. The coal does not move out very fast, but it is expected to as soon as the fall crops begin to come in. The Buffalo shipment by Lake for the week was 168,000 tons, which is a decidedly large amount.

TORONTO

Plentiful supplies available and prices showing a softening tendency.

Trade shows little change for the better, manufacturing requirements being much below normal, with a downward tendency in wholesale prices for steam coal. The yards are well suplied, there being a larger quantity of bituminous than usual on the market, owing to the fact that but little is going up the Lakes, vessels being unable to get return cargoes of ore. Buyers as a rule are only purchasing for immediate requirements. Prices are as follows: Retail, anthracite egg, stove and nut, $7.50; grate, $7.25; pea, $6.25. Bituminous steam, $5.25; screenings, $4.35; domestic lump, $6; cannel, $7.50; wholesale f.o.b. cars three-quarter lump, $3.68; screenings, $2.64.

TOLEDO

Market dull and prices unchanged. Indications of improved industrial conditions creates hopes of a better market shortly.

The Toledo market is still quiet and prices remain the same. It is believed that Lake shipping will show improvement as soon as business picks up a little, which seems probable according to present indications. Many of the smaller factories have been closed for summer repairs and inventories, and will be reopened within a short time.

The new Hocking Valley docks here have been formally opened and a number of boats loaded and sent up the Lakes with coal. The Hocking Valley has transferred one crew from its old west side docks to its new plant. On July 1 the old dock machinery and trackage rights of the Hocking Valley on the west side will be turned over to the Pennsylvania, after which the Hocking Valley will maintain night and day crews at its new docks.

COLUMBUS

Steam coals in fairly good demand and at slightly better prices. Domestic dull though showing indications of improvement.

Demand for steam grades is holding up well despite the general business depression which cuts into the tonnage required for factories. West Virginia and Kentucky coal is finding its way into Ohio to fill this demand. Prices which were extremely low several weeks ago are more steady and higher. Railroads are also in the market for fuel and have confiscated coal cargoes found on their lines.

There is also a little better demand for domestic grades but so far dealers have been able to take care of this business without inconvenience. Pocahontas and West Virginia splints are in good demand and the same is true of anthracite. Prices on domestic coals are rather firm and ruling unchanged at the levels which have prevailed for several weeks.

The Lake Trade is as active as could be expected with Ohio mines closed. The Hocking Valley docks at Toledo have handled 680,000 tons since the opening of navigation.

What quotations are being made in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump	$1.50@$1.40		$1.50@$1.40	$1.50@$1.40
¾-inch	1.35@ 1.30	$1.20@$1.15	1.35@ 1.30	1.30@ 1.25
Nut	1.30@ 1.25		1.25@ 1.20	1.25@ 1.20
Mine-run	1.15@ 1.10	1.10@ 1.05	1.15@ 1.10	1.10@ 1.05
Nut, pea and slack	0.85@ 0.80		0.85@ 0.80	0.80@ 0.75
Coarse slack	0.75@ 0.70	0.85@ 0.80	0.75@ 0.70	0.70@ 0.65

CLEVELAND

Sharp competition between West Virginia and Pennsylvania operators for the Ohio trade. Labor situation still indeterminate. Lake trade continues slightly below normal.

Prices for slack show some signs of advancing and a better demand is being had from all quarters. The improvement is so slight that it is not a real feature, but it is indicative of the future. Fairmount coal has practically been driven out of the market by Youghiogheny and other Pennsylvania fuels that are being sold at remarkably low prices, which the West Virginia operators are refusing to meet. Very little coal is coming in on consignment, as the market is too weak for that.

Pocahontas operators are quoting lump and egg at $2.25 a ton at the mines. A few odd cars were on the market at $2.10, but were not being generally offered, as the broker is not in any hurry to sell. The market for Pocahontas slack is so slow that they are not making the prepared sizes. An odd car of splint was on the market and a few other domestic coals are to be found, but not enough to make them features of the situation.

Hard coal is moving in the usual summer quantities and dealers are having no difficulty getting what they need.

Interest in the coal strike has been centered on southern Ohio and Hocking negotiations, which so far have not been successful. Eastern Ohio operators are prepared to reopen negotiations with the miners through a single representative, who will meet a single representative of the miners. They are anxious to reopen the mines, as the demand for their product is such they fear to lose part of their trade. No effort will be made to meet the miners until Hocking operators have concluded negotiations one way or the other.

The Lake situation is very easy so far as the coal shipper is concerned. Vessels are plentiful, as grain cargoes and ore are so short of the demand the ship-owners want to delay their vessels as much as possible. There are a number of boats operating exclusively in the coal trade, and the result is the coal shippers have more vessels offered them than they have cargoes to load.

For shipment the following prices are being asked:

	Pocahontas	Youghiogheny	Fairmount
Lump	$3.60		
Lump, 1½-in		$2.35	
Lump, ¾-in		2.25	$2.00
Mine run	2.60	2.10	1.90
Egg	3.60		
Nut		2.20	
Slack	2.20@2.35	1.60@1.65	1.65@1.70

CINCINNATI

Resumption of operations in the Kanawha fields and slowing down in Lake shipping are depressing the trade. Surplus tonnages again accumulating. Market completely devoid of interest.

Probably the slowest market of the season has prevailed during the past week, which, considering the previous slump, might well be expected to produce a bad effect. The cessation of operations in the Kanawha field had a slightly favorable effect upon the market for a time, and this, coupled with a reported improvement in the Lake trade, made things temporarily better. But with the resumption of work at the Kanawha mines, fresh supplies of surplus fuel have been thrown upon the market. Both dealers and operators declare that the domestic movement is slower than ever before at this season.

Reports indicate renewed difficulty in keeping the Lake movement up to anything like a normal volume, boats refusing to carry coal up when they must come back light. As the result of this accumulation of adverse conditions the trade in this vicinity is facing an almost unprecedented slump just now; and while the general opinion, based on the necessary consumption of an ordinary year, is that a serious shortage later is inevitable, this does not seem to have any effect at the present time.

DETROIT

Trade holding its own and a more hopeful feeling prevails.

Operators are taking a more hopeful view of the situation; the trade is at least holding its own, and is generally considered as good as could be expected in view of the adverse conditions prevailing. The freight-rate increase asked for by the railroads continues to be the main controlling feature in the present situation. There are also other matters pending in railroad circles that are of vital interest to the coal industry, such as the spotting rules.

SOUTHERN

LOUISVILLE

New July circular has gone into effect and the market is notably firmer. Steam demand from the South is particularly good.

The first of July saw a general advance of about 10c. a ton on Kentucky domestic coals, for which the demand has been improving steadily in the last few weeks. This advance applied especially to the eastern Kentucky field, which has been booking orders in quantities for July, August and September delivery for some time. In parts of the Eastern and Western fields, however, the advance was not made generally effective.

Perhaps one of the most significant things about the market is that the industrial requirements to the South seem more insistent than from sections north of the Ohio River. The Southern demand has disposed of what was getting to be a large accumulation of steam coals; in fact, some of the mines, with effective selling organizations, have now had to instruct their Southern agents to go slow in accepting orders, as they seem to be booked ahead for heavy tonnages.

Such price changes as have been made in the last few days were discounted by the rate at which orders were booked for later delivery. It may be noted that the fancier grades of Southeastern Kentucky block coals are bringing from $1.75 to $1.90, f.o.b. mines, while the Harlan and Straight Creek grades are going at from $1.50 to $1.75. Otherwise the market is unchanged.

MIDDLE WESTERN

INDIANAPOLIS

A gradual improvement expected, due to the big wheat crop. Conditions generally unchanged yet, as to running schedule and prices. It is believed the railroads will be able to handle the heavy fall business satisfactorily.

The wheat is moving and the coal trade takes on a more cheerful tone. In spite of adverse conditions, the marketing of the large crop is bound to help toward a general improvement. There are contracts still hanging back, awaiting the turn of affairs and these will probably be closed at the first indication of improvement. An additional mine here and there in the state is starting up again but the general situation shows no marked improvement. There is more than the normal movement of Eastern coals going into the consumers cellars.

Sometimes there is an advance in Pocahontas at midsummer but not a rise all along the line. The dealers say it is caused by increases at the mines, but operators deny this and seem anxious for more business at old prices. The Indiana mines are said to be in good shape for a heavy run, if future trade conditions demand it. Their average operation now is not much better than half-time. No apprehension is apparent concerning the ability of railroads to handle the coal traffic during the movement of the wheat.

Indianapolis retail dealers have advanced their prices 25c. on both hard and soft coal, following similar advances at the mines. Their new quotations are:

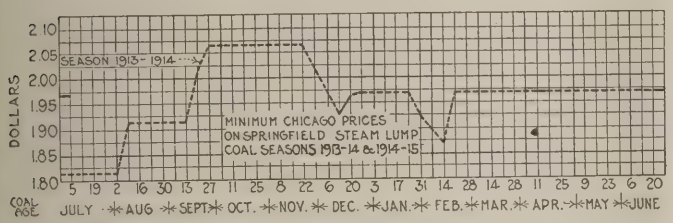
Anthracite, chestnut	$7.75	Pittsburgh lump	$4.00
Anthracite, stove and egg	7.50	Raymond lump	4.00
Anthracite, grate	7.25	Winifred lump	4.00
Pocahontas, forked lump	5.50	Hocking Valley lump	4.00
Pocahontas, shoveled lump	5.00	Luhrig lump	4.00
Pocahontas, mine run	4.00	Luhrig washed egg	4.25
Pocahontas, nut and slack	3.50	Cannel	6.00
Blossburg	5.50	Linton No. 4 lump	3.00
Jackson (Ohio)	4.75	Linton No. 4 egg	3.00
Kanawha lump	4.00	Indiana washed egg	3.25
Kanawha, egg and nut	4.00	Brazil block	4.00
		Connellsville lump	6.00
		Citizens egg coke	5.50
		Citizens nut coke	5.50

CHICAGO

Stronger demand for same grades in the Chicago market and the general tone is improved. The call for Western coal is heavier, buying for near future delivery being more active.

A slight improvement in the steam trade has been reported and the consumption of fine coal is in excess of production. There is a better demand for mine-run and steam

lump which is construed as an indication that there probably will be a revival in business early in July. Anthracite dealers report slack business.



There has been but little change in the smokeless coal market. The larger producers are still adhering to the circular price of $1.25 for mine-run although many sales at $1 a ton have been reported. There is an unusual scarcity of lump and egg. Hocking coal, of course, remains off the market. On account of harvesting requirements Franklin County coal has been in demand among the farmers. All of the larger operators announced an advance from $1.35 to $1.50 for domestic sizes July 1. Springfield coal is being sold almost exclusively to the steam trade, no effort being made to force any domestic on the market. Screenings have been advanced five cents a ton as there has been a scarcity of this fuel.

Prevailing prices in Chicago are:

	Springfield	Franklin Co.	Clinton	W.Va.
Domestic lump	$2.07	$2.30@2.40	$2.12	
Steam lump	1.97		1.97	
Egg		2.30@2.40		$3.95
Mine-run	1.87	2.15@2.25	1.87	3.05@3.30
Screenings	1.62@1.67	1.95	1.62@1.67	

Harrisburg coal is quoted at: Domestic lump and egg, $2.30@2.40; steam lump, $2.25; mine-run, $2.15@2.25; screenings, $1.95; No. 1 nut, $2.40@2.55; No. 2 nut, $2.30@2.40.

Carterville prices are: Lump, $2.30@2.40; egg, $2.30@2.40 No. 1 washed, $2.40@2.55; No. 2 washed, $2.45.

ST. LOUIS

No demand with the possible exception of some of the steam sizes. Low prices have prevailed over the first have of the current year.

There is no demand for any kind of coal, with the possible exception of a small tonnage of screenings. Right now steam sizes are on the rise, and will possibly be at their high mark until July 8 or 10, when they will start to decline as they did a year ago. It will be remembered that screenings, between July 15 and 25, dropped about 30c. a ton. The circular of a year ago, is identical with the price list of this week, excepting, perhaps, that washed coal is not as strong now as it was then and that the higher grades of coal from Williamson and Franklin Counties are bringing as much as 10c. per ton more this year than last year. This is accounted for largely by the fact that the trade is becoming more discriminating.

The first six months of the calendar year have been anything but profitable ones to the coal trade. Unusually low prices have prevailed, and the greater portion of the period, coal has been selling at cost or less. In Illinois coals there will be nothing doing until about July 6 or 7, when the demand will begin. There is practically nothing moving from that field right now.

Independent and off grade anthracite is selling as much as 50c. below the circular. Smokeless is not coming in, in the volume that it has for the past two or three years, and indications are that its tonnage is diminishing.

The lowest priced coal recently shipped into this market was from West Frankfort, mine-run being quoted as low as 75c., Franklin County. Steam sizes from this point are being sold for less than the cheapest Carterville on the market, which indicates that there is something wrong with the Franklin County field, or at least a portion of it.

The prevailing circular is:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	.....	.....	$1.15	$0.80@0.90	$1.15
3-in. lump	.....	.....	.....	.....	.....

KANSAS CITY

Threshing demand absorbing considerable coal and the mines are moderately active. Labor scarce and some small strikes reported.

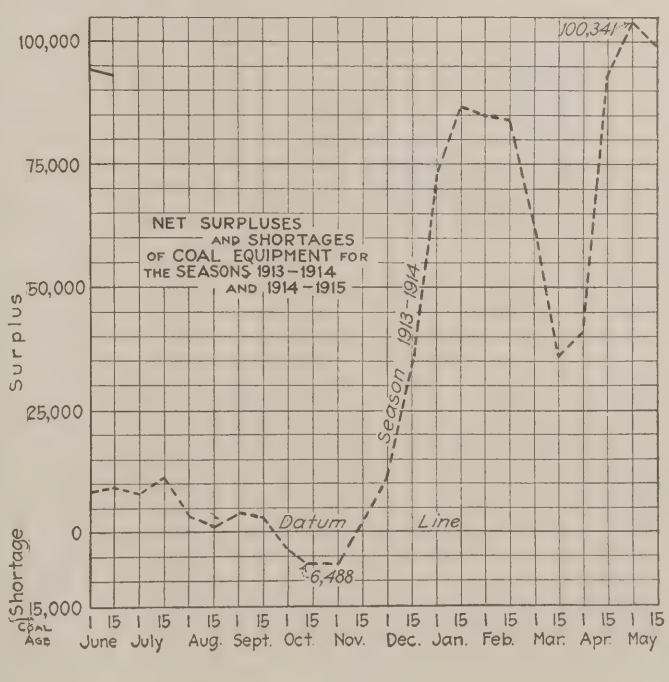
Much improvement has been noted in Kansas City recently, the demand from various sources being stronger. Coal is moving actively to the harvest fields, where threshing is on in full force. Industrial concerns are beginning to order for later delivery, and most of the mines are preparing for extended operations.

Difficulty has been caused by a scarcity of men in some districts. It is reported that some miners have gone to the harvest fields. A number of difficulties between operators and organized labor are reported. In most cases, however, these have been quickly settled and there is little room for concern. The market has been steady, with prospects for an advance in view of the improved conditions.

PORTLAND, ORE.

Nanaimo mines are working again after the settlement of the strike. They are getting out domestic coal but have not yet placed any steam fuel in the market, owing to the fact that considerable development work will have to be done; it is expected to have steam coal on the market within the next two months, however. These mines are operated by the Western Fuel Co. The South Wellington mines are working steadily, and at Comox the Canadian Colliers Co. is busy on its bunker-coal trade. The mines at Ladysmith are also working.

PRODUCTION AND TRANSPORTATION STATISTICS



THE CAR SITUATION

American Ry. Association reports surpluses and shortages of coal equipment for two weeks ended June 15, as follows:

	Surplus	Shortage	Net*
New England Lines	1,531	0	**1,531**
N. Y.; New Jersey, Del.; Maryland; Eastern Penn.	20,854	0	**20,854**
Ohio; Indiana; Michigan; Western Pennsylvania	41,448	0	**41,448**
West Virginia, Virginia, North & South Carolina	5,962	19	**5,943**
Kentucky, Tenn.; Miss.; Alabama, Georgia, Florida	10,120	0	**10,120**
Iowa, Illinois, Wis., Minn.; North & South Dakota	8,347	9	**8,338**
Montana, Wyoming, Nebraska	954	0	**954**
Kansas, Colorado, Missouri, Arkansas, Oklahoma	1,589	0	**1,589**
Texas, Louisiana, New Mexico	222	20	**202**
Oregon, Idaho, California, Arizona	2,493	1	**2,492**
Canadian Lines	0	0	**0**
Total	93,520	49	**93,471**

	Feb. 15	Mar. 1	Mar. 15	Apr. 1	Apr. 15	May 1	May 15	June 1
Surplus	84,775	64,822	39,133	41,055	92,139	100,370	99,664	94,770

*Bold face type indicates a surplus.

SOUTHWESTERN TONNAGE

The following is a comparative statement of the Southwestern tonnage for December and the years 1912 and 1913:

State	December		Year	
	1912	1913	1912	1913
Missouri	286,828	266,335	3,018,351	2,924,728
Kansas	511,651	540,872	5,153,543	5,782,194
Arkansas	169,490	138,678	1,852,290	1,943,861
Oklahoma	318,899	324,728	3,037,995	3,534,842
Totals	1,286,868	1,270,613	13,062,179	14,185,625

This statement only covers the tonnage of members of the association, which is estimated to be at least 95% of the entire production.

IMPORTS AND EXPORTS

The following is a comparative statement of imports and exports in the United States for April, 1913-14, and for the ten months ending April, 1912-13-14, in long tons:

	10 Months			April	
Imports from:	1912	1913	1914	1913	1914
United Kingdom	6,091	8,550	10,133	1,099	442
Canada	850,351	1,181,216	882,772	119,805	136,486

COAL FREIGHT DECISIONS

I. C. C. No. 5822—Hammerschmidt & Frazen Co. vs. Chicago & North Western Ry.

Proviso, Ill., a terminal of the Chicago & North Western Ry., within, but on the extreme outer edge of, the Chicago switching district, is an interchange point at which the North Western receives coal from the Indiana Harbor Belt Railroad moving in course of through transportation from points east of the Indiana-Illinois state line to Elmhurst, Ill., a point beyond the Chicago switching district, three miles west of Proviso on the North Western. Upon complaint alleging that the rates from Chicago to Elmhurst are unreasonable and unduly prejudicial, when applied as proportional rates from Proviso to Elmhurst, **Held:**

1. That the relative situation of Elmhurst and Proviso is not different in principle from that presented where competitive points are in close proximity to one another but in groups from or to which different group rates apply.

2. That while carriers may establish common rates to a defined zone or group of points and treat them all as a unit for rate-basing purposes, they do so subject to the inhibitions of the law against creating undue prejudice to points just without or beyond that zone.

3. The traffic here involved is through traffic, and the reasonableness of rates applicable thereto must be considered in respect to the reasonableness of the through rates in their entirety. So considered, the through rates to Elmhurst are not shown to be unreasonable in themselves, but they are found to be unduly prejudicial against Elmhurst and unduly preferential to Chicago and Proviso.

FOREIGN MARKETS

GREAT BRITAIN

June 19—Business is somewhat restricted owing to the strike of Marine engineers. Loading operations have so far been unchecked, but unless a quick settlement takes place the holding up of vessels will reduce shipments and cause pit stoppages.

Prices are quotable as follows:

Best Welsh steam	$5.04@5.28	Best Monmouthshires	$4.08@4.14
Best seconds	4.64@4.80	Seconds	3.84@3.90
Seconds	4.44@4.56	Best Cardiff smalls	2.58@2.64
Best dry coals	4.32@4.50	Seconds	2.46@2.52

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are net f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.

Coke is quoted at: Special foundry, $6.24; good foundry, $4.80@5.52; furnace, $4.08@4.56.

British Exports—The following is a comparative statement of British exports for May and the five months of the last three years, in long tons:

	May		5 Months		
	1913	1914	1912	1913	1914
Anthracite	251,117	253,865	784,220	1,188,283	1,154,556
Steam	4,318,911	4,432,243	14,791,968	21,636,454	20,982,745
Gas	929,955	1,096,487	3,326,247	4,523,898	4,746,561
Household	128,856	142,968	485,599	710,583	603,010
Other sorts	301,108	282,773	1,028,645	1,460,607	1,365,846
Total	5,929,947	6,208,331	20,416,769	29,519,825	28,852,718
Coke	71,944	75,082	336,969	424,334	444,446
Manufactured fuel	145,723	186,050	526,634	837,070	852,326
Grand total	6,147,614	6,469,463	21,280,282	30,781,229	30,149,490
Bunker coal	1,618,844	1,840,950		8,366,021	8,500,680

GERMANY

Imports and exports in the German empire for April and the first four months were:

	April		4 Months	
Imports	1913	1914	1914	Change
Coal	940,715	809,690	2,934,902	—183,657
Lignite	650,074	603,636	2,131,097	—251,496
Coke	42,118	45,759	183,790	+1,676

COAL SECURITIES

Dividends have been announced as follows:

Delaware, Lackawanna & Western Coal—Regular quarterly dividend of 2½%, payable July 15, to holders of record, July 1.

Lehigh Valley Coal Sales—Regular quarterly dividend of 2½%, payable July 10 to holders of record, July 9.

Pittsburgh Coal—Regular quarterly dividend of 1¼% on the preferred, payable July 25 to holders of record, July 15.

Mahoning Coal R.R.—Dividend on the common of $5, payable Aug. 1 to holders of record July 15, and on the preferred of $1.25 payable July 1 to holders of record, June 19.

Reading Co.—Regular quarterly dividend of 2% on the common, payable Aug. 13 to holders of record July 28; regular quarterly on the first preferred of 1%, payable Sept. 10 to holders of record Aug. 25, and regular quarterly on second preferred of 1%, payable July 9, to holders of record, June 27.

St. Louis, Rocky Mountain & Pacific Co.—Regular quarterly of 1¼% on the preferred, payable June 30 to holders of record, June 21 to 29.

Island Creek Coal Co.—Regular quarterly dividend on the common of 50c., together with an extra dividend of $3, both payable Aug. 1 to holders of record, July 15, and the regular quarterly dividend of $1.50 on the preferred, payable July 1 to holders of record June 23.

COAL AGE

Vol. 6 NEW YORK, JULY 11, 1914 No. 2

Most states in which coal mining is an important industry have a law sanctioning the employment of check weighmen at mines. Sometimes, the law is more specific and states that there *shall be* a check weighman at all mines.

A little investigation in these states will reveal the following facts:

1.—All camps that are unionized and in which the "cut out" is in vogue, have a check weighman.

2.—Most camps that are not unionized do not have the check weighmen.

From these facts it is easy to assume that the operators are opposed to check weighmen and, at the non-union camps, intimidate the men into relinquishing their statutory rights. In fact, this charge has been repeatedly made by Eastern writers, in commenting on the present strike in Colorado.

Judging by our investigations in other states, we feel confident that these charges will be found untrue.

In Alabama, for example, during the 1908 strike, the union officials continually made capital of the fact that most mines were without check weighmen, and that this condition of affairs was contrary to the state law. After the strike was called off, the large companies issued orders to all of their superintendents to call meetings and insist on the miners electing check weighmen for each tipple.

Strange to say (from the viewpoint of the public) the men took no interest in the matter, and at many camps, not only refused to elect weighmen, but insisted on being allowed to continue without them.

Why?

1.—They didn't want to be assessed with their pro rata share of the weighman's wages.

2.—They had absolute confidence in the company weighman.

Just consider a moment, if you please, the position of a company weighman. If dishonest, he has all the opportunity in the world to steal from the company, by making false entries and crediting the surplus to "dummies."

It naturally follows that it is to the company's interest to pick an honest weighman, and that when such a man is selected, the miners will get honest weights.

Do you wonder, then, that the men are willing to trust the company's representative?

In Tennessee, we know of a case where a superintendent of a small operation, wishing to relieve his miners of the expense of a check weighman and yet unwilling to merit their distrust, offered to allow his men to elect a weighman from their ranks, to serve in the dual capacity. They refused because they preferred to bank on the boss' judgment, for so important a post.

Are we asking for the elimination of the check weighman?

Certainly not.

However, the next time you hear a union official or a college professor making rash statements about intimidation, etc., just give him a chance to produce some facts.

Indiana's First Electrically Operated Coal Mine

By Wiley F. Corl*

SYNOPSIS—A power contract which is fair to all concerned, and modern equipment carefully installed, render it possible for this mine to produce coal with an expense for current of but slightly over 3c. per ton of output.

Mine No. 1 of the J. K. Dering Coal Co., at Clinton, Ind., is, so far as we know, the first mine in that state to be operated entirely by electricity. It is believed, therefore, that a description of this installation will be of interest to mining men.

Many papers have been writen, setting forth the advantages of operating coal mines electrically over other methods; it is therefore considered unnecessary to give a review of this subject, as we believe that any new mine which is likely to be developed at this time will be electrically operated, provided cheap current is available.

Many mining men are, however, still sceptical as to the advantages of electric operation, and advancement in this direction is due to the foresight and energy of such men as J. K. Dering, who are willing to take the lead in these matters.

Mine No. 1, formerly known as Oak Hill mine, has been in operation for a number of years in upper seams of coal, but for only about one year in the No. 3 seam, which is now being worked. When this mine was opened in the No. 3 seam, an entirely new equipment was provided, including a steel tipple of the well known A. & G. type, a view of which is shown in Fig. 6.

The new electrified mine was placed in operation on Jan. 19, 1914, and a record of the power consumption since that date is given later in this article. It should be noted that although the mine is at present working at about one-third of its capacity, the cost of power per ton of coal is extremely low. A general plan, showing the location of buildings and the wiring scheme, is shown in Fig. 8. The photograph, Fig. 2, is a view of the plant, showing particularly the high-tension outdoor switch and

*Electrical engineer, Allen and Garcia Co., Chicago.

FIG. 6. GENERAL VIEW OF TIPPLE AND SUBSTATION

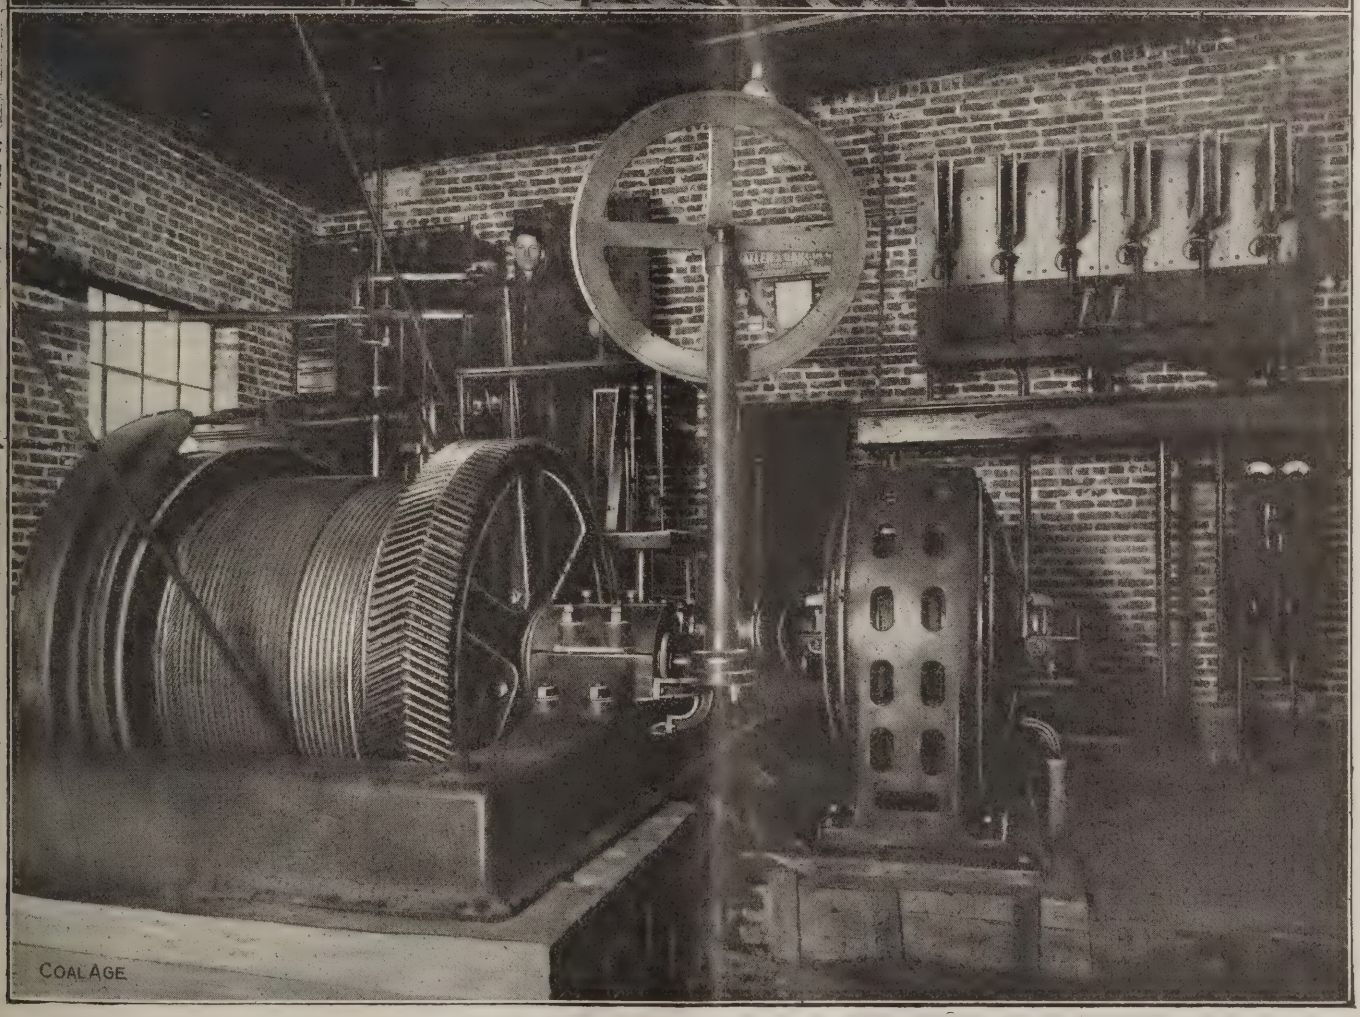

FIG. 7. THE ELECTRIC HOISTING ENGINE

the wires entering the building, the layout of the apparatus and the electric conduits are shown in Fig. 9.

Central Station Power Is Employed

Electric power is purchased from the Terre Haute, Indianapolis & Eastern Traction Co., and is brought to the mine at 22,000 volts, 3-phase, 60 cycles. It is then stepped down to 2200 volts by means of the transformers shown in Fig. 5.

The hoist motor and the motor-generator set are operated at 2200 volts, while all other motors take 220 volts, the power being taken from a small bank or secondary transformers.

Fig. 4 shows the motor-generator set and the switchboard controlling the different circuits. Extra panels are supplied to take care of additional motor-generator sets and additional 2200-volt and 220-volt circuits.

The electric hoist is shown in Fig. 7. This machine was furnished by the Ottumwa Iron Works. The drum is

The hoist motor is of the rotor-wound type and was designed to operate at a full speed of 514 r.p.m. This speed can be varied, however, in 7 steps and is controlled by a master drum, which operates solenoid switches and causes resistances to be cut into and out of each phase of the rotor circuit. This drum also reverses the direction of rotation of the motor at the will of the operator.

Double Precautions Against Overwinding

To guard against over-winding, a limit switch is geared to the hoist drum, so arranged as to shut off the current and apply the brakes after the latter has made a fixed number of revolutions. As an extra precaution switches are also placed on the tipple guides below the sheaves, so that the current will be cut off and the breaks applied in case the geared limit switch fails to act. In this connection it might be emphasized that the electric hoist can be made safer than a steam engine, and in fact can be better controlled in every way.

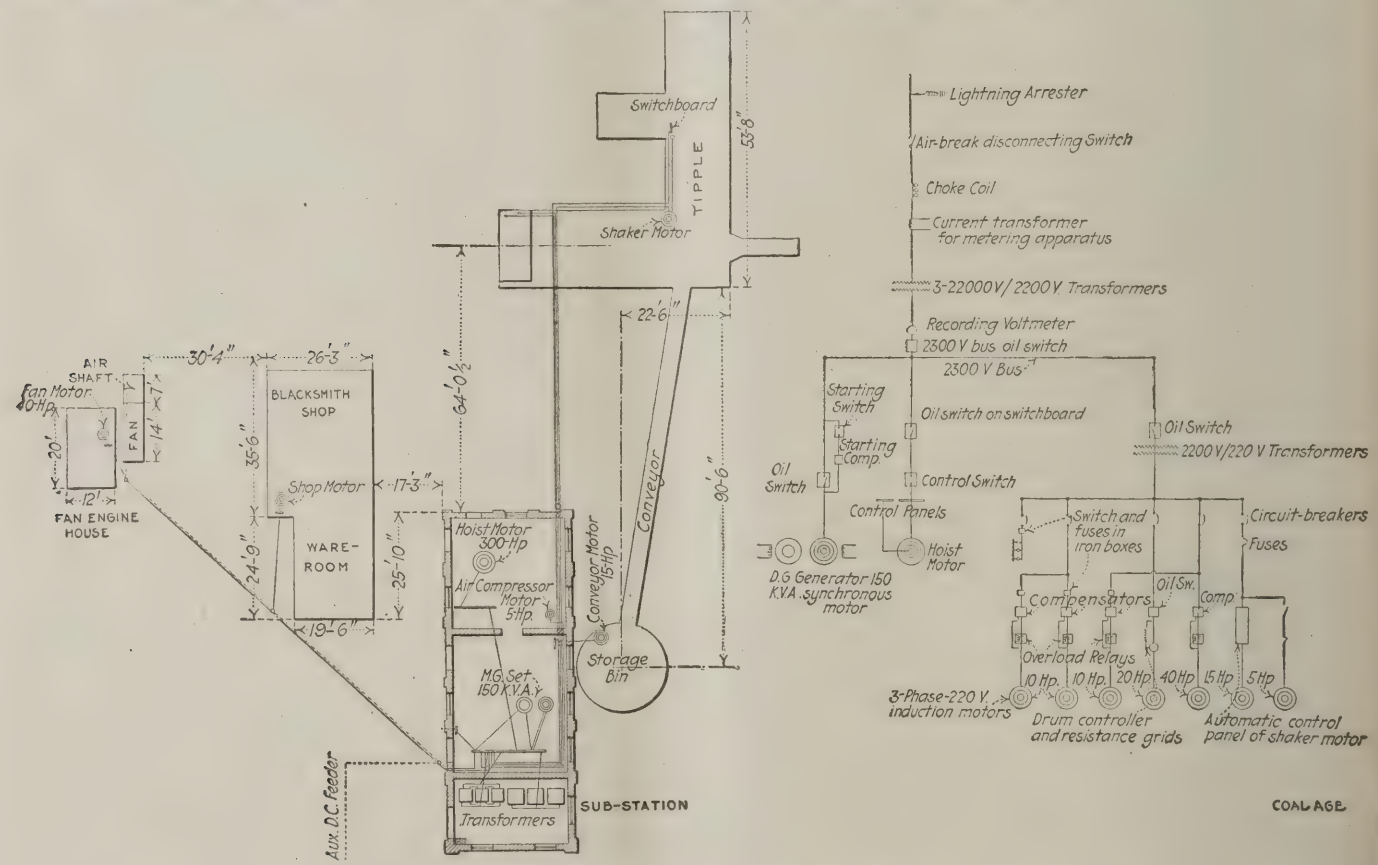

Fig. 8. Plan of Buildings and Wiring

5 ft. in diameter and is driven by means of herringbone gears from a 300-hp., 2200-volt motor. The brake is operated by a compressed-air engine of the air-oil type, which permits of close adjustment in braking. The air is supplied from an automatic, electrically-driven air compressor.

The capacity of the hoist is 306 tons per hour. The following table shows some of the information relative to its duty:

TABLE OF HOIST DUTY

Weight of cage	5000 lb.
Weight of car	1200 lb.
Weight of 1⅛-in. rope	550 lb.
Weight of coal	3400 lb.
Vertical lift of hoist	274 ft.
Time of acceleration	6 seconds
Time of constant running	7 seconds
Time of caging	3 seconds
Total time for one complete cycle	20 seconds

At present there is one 150-kw. synchronous motor-generator set which furnishes direct current at 250 volts for operating the pump and the cutting machines. The coal is undercut by Sullivan continuous cutters. An additional 300-kw. set will be installed immediately and electric locomotives will then be employed for hauling and gathering the coal. Electric power at 250 volts, direct current, will also be supplied from this installation to a neighboring mine for use in haulage and cutting.

An arrangement is also provided whereby power at 250 volts, direct current, can be returned from an engine-driven unit, at this neighboring mine and reverse the motor-generator set. In this way sufficient power is obtainable to operate the fan and to run the hoist at a low speed in case of failure of the transmission line from the central power station.

A new 8-ft. Jeffrey fan has been installed, as shown in Fig. 1. This machine is driven by a geared 40-20-hp. two-speed motor, as shown in Fig. 3. The fan requires at this time only about 10 hp. When the mine is further developed, however, it will consume about 40 hp., and it is then expected that the motor will be operated at full speed during the day time, and at half speed at night to save current. The shaking screen is operated by a 20-hp., variable-speed motor at 300 to 900 r.p.m. The control of this unit is in the weighman's house in the tipple.

The conveyor is operated by a 15-hp. constant-speed motor. This machine has an automatic-control arrangement, by which it can be started or stopped from the weighman's house also.

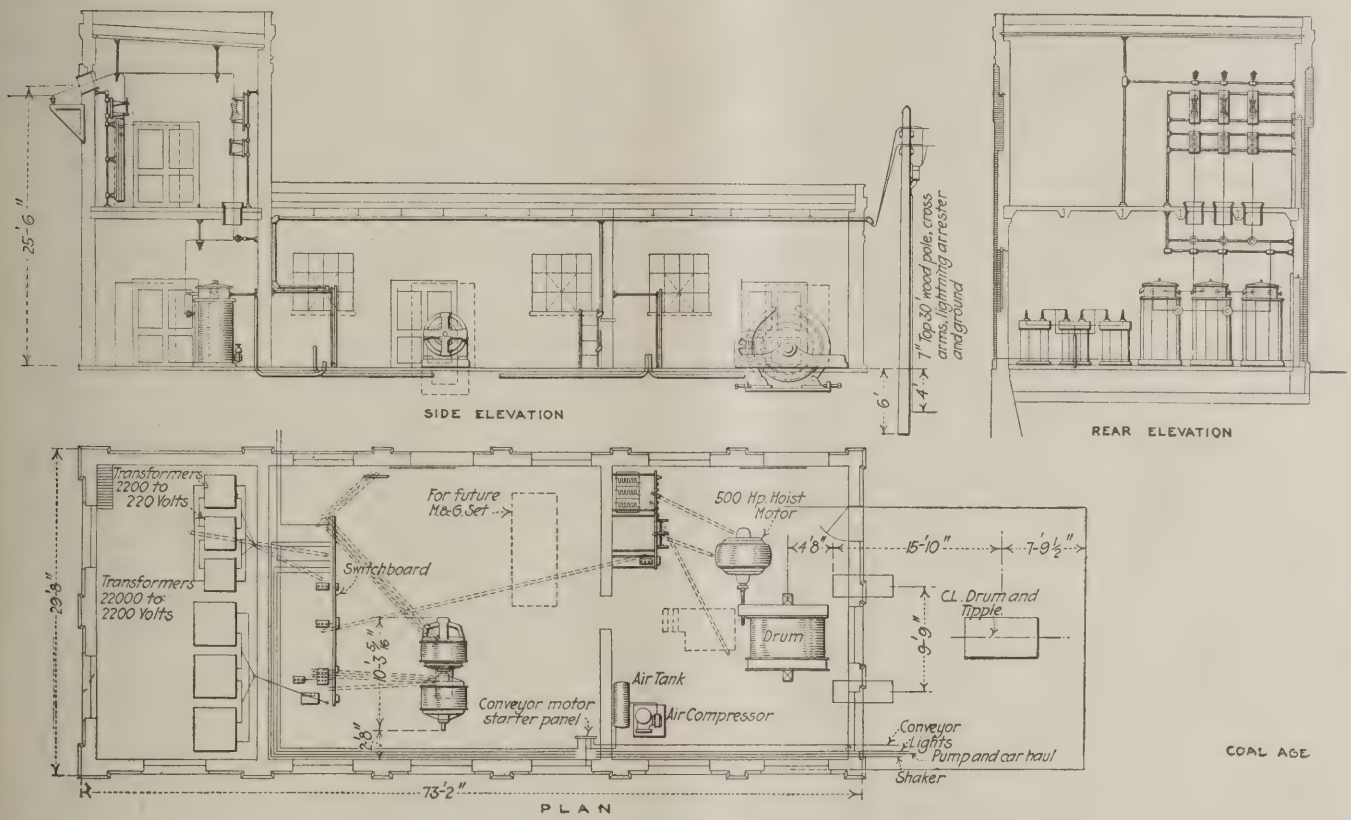

FIG. 9. LAYOUT OF APPARATUS AND CONDUITS

This mine does not make much water, and the pumping duty is light. A Deming triplex plunger pump is direct connected to a 5-hp. motor and is operated from the 250-volt, direct-current underground circuit.

A new brick building has been erected for shop work, in which the line shaft is driven by a 10-hp. constant-speed motor. The empty cars from the cage are taken up an incline by a car drag, actuated by a 10-hp. constant-speed motor. An electric switch, operated by the cager at the shaft, has been installed at the top of this car haul, so that the empty wagons can be sent to ether runaround. This witch saves a man who would otherwise be required.

COMMERCIAL ELECTRIFICATION DEPENDS ON COST

Almost everyone will agree that an electrified mine is more desirable than a steam operated plant, provided that the cost of installation and operation is no greater. Therefore, whether or not a development can be electrified depends upon the cost of current.

There are many forms of power contracts in use at the present time, several of which divide their charges into two parts; a primary charge, depending upon the maximum demand, and one based upon the current consumption. This latter item per kilowatt-hour varies with the amount of current used. This form of contract is based upon engineering facts and is best from a theoretical standpoint.

The main disadvantage of this type of agreement lies in the fact that it is hard to explain to the ordinary coal operator, who is not versed in electrical technique. It usually penalizes the small consumer since the average cost of energy is considerably higher to him than to one using a large quantity.

Of course, from an electrical standpoint the larger user is entitled to a somewhat lower rate. We do not intend to here discuss the merits of different rates, but only to say that from an operator's standpoint it appears best when possible to purchase electrical energy on a metered-current basis (with a sliding scale), although provision should rightly be made to cover a minimum bill.

THE CONTRACT IS FAIR BOTH WAYS

The Terre Haute, Indianapolis & Eastern Traction Co.'s rate is a very fair one for both the operator and the power company. The basis of this rate is a metered-current charge (with a sliding scale), while the power company is guaranteed a minimum bill, based upon a charge of $1 per month per kilowatt of maximum demand, this demand being assumed to be two-thirds of the connected load (manufacturers' rating).

Normally the energy consumed on the metered-current basis is greater than the maximum demand charges, in which case the minimum charge is absorbed.

The rates on the metered-current charge are as follows:

	Cents per Kw.-Hr.
For the first 5000 kw.-hr.	1.75
For the second 5000 kw.-hr.	1.6
For the next 40,000 kw-hr.	1.5
All current in excess of the above	1.35

The energy is metered on the 2200-volt side of the transformers and the bills are subject to a discount of 10 per cent., provided they are paid within 10 days after presentation. Several provisions are inserted in the contract to protect the power company, as well as the coal company, in case of difficulties in operation.

During the month of March, 1914, the mine worked 25 days at an average of nearly 600 tons per day, making a total production of 14,520 tons. The current consumption during this month, including the idle days, was 33,000 kw.-hr., or 2.27 kw.-hr. per ton of coal. This includes all operations except hauling.

This current consumption is divided into the following parts:

For hoisting 1.26 kw.-hr. per ton of coal.
For all miscellaneous motors, 0.295 kw.-hr. per ton of coal.
For cutting and pumping 0.715 kw.-hr. per ton of coal.

The consumption for cutting and pumping is taken on the alternating-current side of the motor-generator set.

All Power Used Is Included in Test

The above record of power consumption includes everything required, idle days as well as working days. On a test the hoist motor takes only 0.6 kw.-hr. per ton of coal per hoist, but this figure is increased even on working days to about 1 kw.-hr., this being partly because the coal is not dumped in one motion, but is "inched" or gradually discharged for better screening. Also many extra hoists are made to take the men, mules and material up and down. When hoists are made at the rate of 3 per minute, it is necessary to reverse or "plug" the motor for quick retarding. This internal electric braking requires about ¼ kw.-hr.

It is expected that when the mine reaches its normal output of 2400 tons per day, the current consumption per ton of coal for all operations, including standby losses and idle days, will be less than 2 kw.-hr.

The power bill for the month of March was $460, which is equal to a charge of approximately 1.4c. per kw.-hr., or slightly over 3c. per ton of coal.

All the engineering work in connection with the design, purchase and installation of this plant was performed by the Allen & Garcia Co., consulting and constructing engineers, of Chicago. The entire electrical equipment was furnished by the General Electric Co., except that the Westinghouse Electric & Mfg. Co. supplied the high-tension transformers, and the Delta Star Electric Co. provided the outdoor switching and protective apparatus.

Robert Nelson, the Electrical Inspector of Mines in Great Britain, says the practical requirements for safety in working an electrical plant underground are: (1) Strong metallic outer coverings for all apparatus (a) to protect insulating material from abrasion, (b) to prevent accidental contact by persons with live parts, and (c) to prevent open sparking. (2) An efficient connection to earth for the metallic outer coverings above mentioned. (3) Provision for making a faulty circuit dead automatically immediately leakage of current begins to develop. (1) and (2) can as readily be provided for in continuous-current working as in 3-phase working. (3) can be more conveniently provided for in 3-phase working.

Extracts from a Superintendent's Diary

Today we broke the company record for tons of coal hoisted from a single track slope in one shift. Am I proud? I am! Am I elated? I am not! The tension has been relieved and I am thinking of what is to follow. Tomorrow every superintendent in the company's employ will receive a slip of paper containing my record, and, along with that slip of paper, although invisible to the unintiated, goes a command to do just a bit better.

That's according to the "speeding-up" system. "Just a little better." So much depends upon that. How can you expect an increase in salary if someone is doing better? How can you ask for more assistants if someone is doing better? How can you ask for new expenditures if someone is doing better? How can you explain anything satisfactorily if someone is doing better?

But one can't be best always. In a short time—possibly in a very short time—someone will beat my record, and, presto, change! I will find myself again with the rear guard, submitting to the prodding of the big boss.

Let me hasten to explain that the big boss isn't half as terrible as I'm trying to picture him. He worked up through the ranks, so he knows how to handle us. He wants to stay where he is, so he's compelled to allow the biggest boss to handle him.

And how about the very biggest boss? Oh, there are unsatisfactory yearly statements and directors' meetings to hold his attention most of the time, and sometimes he probably gets a bit nervous himself.

Last week, at our regular monthly meeting of all the company superintendents, the boss kept his eyes pretty constantly on my corner of the room whenever records were discussed, and such partiality, properly interpreted, is always a reminder that the favored one hasn't been at the head of the record list for some time. It is therefore deemed advisable to indicate that a little extra ginger might be appreciated. This extra ginger has cost me some sleep during the week, but it resulted in today's record. At the next meeting it is likely I won't be noticed. Who will? Probably Tim Daily, and the old man can't stand much more of this close inspection.

These old men who are close to the 65 mark get flustered easily, and, if they once lose their nerve, the jig is up for all time.

Then there is another unfortunate combination of circumstances to affect the old man. Two of the assistant superintendents have been offered jobs as superintendents by other companies, and the boss is sounding carefully before consenting to lose them. Daily realizes this and, in consequence, is already nervous.

And only three years has passed since Daily broke the best previous record and held it for six months.

We were discussing it last week. "Tom," said the old man, putting his hand on my shoulder (I'm still Tom to him, just as I was ten years ago, when he gave me my first job as rodman on his crew) "Tom, three other companies tried to get me then, but I refused to be tempted; and you can't guess why. No, it wasn't company loyalty. It was the fear of losing my right to an old-age pension. In one more year she'll be mine, Tom. It's all that can save the old man now." Records, ginger, old-age pensions, and possible rivals—all to think of at one time. Do you wonder old men drop off suddenly sometimes?

Effect of Panama Canal on World's Coal Markets--III

By F. R. Wadleigh.*

SYNOPSIS—This is the third and concluding article discussing ex-Gov. MacCorkle's paper on this subject. This installment deals largely with the competition West Virginia may expect among the other domestic coals. Pennsylvania, Virginia and Alabama will all bid aggressively for the export business. In conclusion Mr. Wadleigh believes American shippers should devote greater attention to the possibilities of briquetting for the export trade.

In the state of Washington there are only three important producing coal counties, and the 1913 production was 3,823,000 tons, the average *price* at the mines in 1912 being $2.39.

As regards the quality of the Washington fuels, the article says: "Forty-nine determinations which are representative of this state show an average of 10,923 B.t.u.," and further, "Ninety-eight determinations of New River coal show an average heating value of 15,232 B.t.u."

The forty-nine determinations of Washington fuel mentioned are for coal as received, while the New River determinations are on dry coal, which is an obviously unfair comparison.

Of the Washington coals, 26 mine samples, dry coal, from the best fields show an average of 12,961 B.t.u. (Bulletin 22, Bureau of Mines.) The average of 116 mine samples from 42 mines in the New River field shows an average of 15,006 B.t.u. dry coal. This is rather a different story and a more accurate comparison.

After giving the average "price" at the mines of Washington coal as $2.39 per net ton and the average "value" of the New River-Pocahontas as a "fraction under $1 per ton," the author deduces that the actual *cost* of the latter coals at Hampton Roads ($1.40 freight plus $1 at mines) is practically the same as the *cost* of the Washington coals at the mines. Here is a confusion of terms between the cost of production and price received. The $2.39 figure for Washington coal is the *price received,* and their actual cost of production is not over $1.50 per ton.

We agree with Mr. MacCorkle, however, that the Washington product will not be a strong competitor with the West Virginia coals along the South Pacific coasts below San Francisco, as the British Columbia fuels are already gaining tonnage over the Washington, while oil is making still further inroads on their markets.

"Alabama Fields Cannot Compete"

The article says: "The expectation of Alabama is to get its coals to Mobile by self-propelling barges."

This is not only an expectation, but an accomplished fact. But the coals are also going to New Orleans, this being the principal tidewater market for Alabama fuels.

The following figures are given in the article to show that Alabama "can never become an enormous competitor with West Virginia in this field":

		Alabama	West Virginia
Production	1912	16,100,600 tons	66,786,687 tons
Value at mines..	1912	$1.29 per ton	$0.94 per ton

Alabama used 4,585,498 tons of coal in its coke ovens, or 28 per cent. of its entire production.

This is hardly a fair comparison as regards prices because:

First—The average *price* at the mines was $1.27 for Alabama coal, not $1.29.

Second—1912 was a low-price year in West Virginia, but not in Alabama.

Third—The lower-priced and inferior coals of West Virginia should not be considered in this connection; the average value at the mines of coal from the New River-Pocahontas area was 98 cents.

The figures from the 1909 Census returns showing a production cost of $1.12 per ton in Alabama and 83½c. in West Virginia are of no value today.

It is further stated in this connection: "Our New River and Pocahontas coals have far greater heating values than those of Alabama."

The average B.t.u. value of the different coals is as follows:

Coal	Samples	Mines	B.t.u.
Pocahontas	205	64	15 008
New River	116	42	15,006
Alabama	43	35	14,266
Pratt, Black Creek and Blue Creek..	...	9	14,883

As to prices, the article says: "New River and Pocahontas coals can be delivered at Hampton Roads at a lower price than Alabama can quote at either Mobile or New Orleans."

The present price of Alabama coals at New Orleans is $3.25 per ton trimmed into ship's bunkers, while the price of New River coal is $2.85 f.o.b. ship, not trimmed. When the water rate on Alabama coal is adjusted and settled, the above price will be cut considerably.

As to distances it is stated: "The sailing distance from Hampton Roads to Colon is 1778 miles, and from Mobile (or New Orleans) is 1376 miles. This relatively small inequality in distance makes practically no difference in the rate to the Panama Canal."

This "relatively small inequality" is 23%, quite enough, we would say, to make a very practical difference in rates, as it actually does.

Quoting Mr. MacCorkle:

"New York City Too Valuable a Port for Coal Shipment"

Under this caption the article states:

"Let us consider briefly our competition with Pennsylvania for this export trade. The ocean port at which Pennsylvania coals are loaded is New York harbor."

Then follows some reasons why New York cannot handle much export trade, crowded harbor, access to her shores over *a crowded and congested railroad* (is this the Pennsylvania or the New York Central or the Baltimore & Ohio?), lack of loading facilities, etc.

As a matter of fact, no coal is loaded for export in New York Harbor. Foreign ships take about 4 million tons per year (the figures for 1912 being 3,949,000 tons), but solely for ships' consumption. West Virginia coal

*Consulting engineer, Real Estate Trust Bldg., Philadelphia, Penn.

cannot compete in this trade under present freight rates.

As regards Philadelphia the article says:

"Philadelphia, by reason of its natural situation, will not participate largely in the export business."

There is nothing in the natural situation of Philadelphia to prevent its participating, and, as a matter of fact, it is a large and increasing factor, the exports for 1913 being 939,900 tons, as compared with 791,500 tons in 1911. For comparison we give the following export figures for 1913, which show Philadelphia's importance in this trade:

Lamberts Point	Hampton Roads	1,284,189
Sewalls Point		307,794
Newport News		838,720
Philadelphia		939,900
Baltimore		870,750

If we deduct from the Hampton Roads exports the 475,317 tons shipped to the Panama Canal, which is for use in the canal work and not really export coal, this leaves only 1,965,387. It thus appears that Philadelphia actually exported more coal than any other port in the United States, if Sewalls Point and Lamberts Point be taken separately.

But it is said further: "In fact, Pennsylvania as a whole, by reason of her enormous and increasing consuming ability, will be less and less a competitor in the more distant export trade. She is devoting her energies largely to her great trade at the Lakes, Canada and New England."

While her consuming ability increases, so does her output. Why should she devote her energies to the Lakes, Canada and New England if she expects to consume all her coal at home? The above markets are just as much outside as are the foreign markets. Pennsylvania output of bituminous coal increased 12 per cent. in 1912 over 1911, and 10 per cent. in 1913 over 1912. Two counties alone produced about as much coal as the whole of West Virginia.

On the question of competition between Pennsylvania and West Virginia the article states: "While our coals are the equals of those of Pennsylvania, West Virginia does not compete in the Eastern markets with that state, except on water-borne coals to Providence, Boston and Portland."

This is not an accurate statement of the case. West Virginia coals compete with Pennsylvania in and around Philadelphia, New York, along the South Atlantic coast and in New England, both against water-borne coals shipped from Philadelphia and New York and all-rail coal from Pennsylvania mines.

Maryland and Virginia Coals

It is stated: "Our Fairmount region is farther away, but is shipping West Virginia coal into Baltimore in competition with that of Maryland." Fairmount coal is entirely different from that of Maryland and can hardly be called competitive. The Big Vein Georges Creek coal of Maryland is *one* of the best smithing coals, but it is also a very excellent steam coal, is used as such by the U. S. Navy and is preferred by many to either New River or Pocahontas for making steam.

Although Mr. MacCorkle mentions the possible competition of Virginia coals, he fails to discuss this point. Evidently he is not familiar with the Clinchfield coals and the aggressive efforts its owners are making to enter the export trade. The Clinchfield company is building a most efficient and modern coaling plant at Charleston, S. C., having a large storage capacity, and has already entered the Galveston and Gulf markets.

True, this coal is not quite equal to New River in heating value, but it will be sold more cheaply; it has the best and most uniform car supply of any group of mines in the country and an aggressive sales organization. The West Virginian operators cannot afford to ignore its competition, as it has already driven them out of some domestic markets. The Stonega Coal Company is also arranging to enter the Tidewater markets. This is an excellent coal, better even than the Clinchfield.

"How Canals Will Help West Virginia"

Mr. MacCorkle says that at Calvin Creek, the head of navigation on the Kanawha River, coal can be placed on barges at $1.15 per ton, and that such coal can be transported to New Orleans at $1.25 to $1.50 per ton. We presume that this is the actual cost and includes no profit (it certainly cannot include any on the coal), but does include all fixed charges, interest, depreciation and insurance; it does not include cost of transferring the coal to ships.

This makes the cost of coal on barges at New Orleans $2.65; to get this coal to Colon it must be transferred to ships, which will add at least 25c. per ton or a total or $2.90, f.o.b. ship New Orleans. Then the freight to Colon is given as $1 per ton, or a total cost at Colon of $3.90.

Admitting the correctness of these figures this still fails to show any advantage, as will be noted in the following:

Via Hampton Roads		Via New Orleans	
Cost of coal at mines..	$0.90	Cost on barges.....	$1.15
Freight, rail	1.40	River freight.....	1.50
Trimming, etc.....	0.10	Transfer to ship.....	0.25
Ocean freight c.i.f. Colon	1.395	Ocean freight c.i.f. Colon	1.00
Total	$3.795	Total	$3.90

And, if the freight from Hampton Roads to Colon can be cut to 90c. per ton, as estimated by the government, then the Hampton Roads route would be only $3.30 as against $3.90. Even with the present quoted price at Hampton Roads, $2.85 plus 10c. trimming, etc., Hampton Roads coal would still have a slight advantage.

Mr. MacCorkle then goes on to say that the great objection to this method of transportation is the difficulty of transferring coal from barges to ships, and that the United States Government, after careful investigation, proposes the building of 500, 1000-ton steel seagoing barges that can be towed on the Gulf and Carribean Sea. Under these conditions, Mr. MacCorkle estimates that West Virginia coal costing $1 or less at the mines could be shipped "anywhere to the coasts of North or South America and sold for $3 or less per ton." By the coasts of North or South America we presume is meant within the Gulf and Carribean Sea, although it is not so stated. How much profit would there be in $3 per ton at Colon?

In speaking of the New River-Pocahontas coals in the article they are called "smokeless" coals. It seems about time that we should stop the use of this misleading and incorrect description. These coals are not smokeless, except when burned under proper combustion conditions. Illinois coals with 35 per cent. volatile can also be burned without smoke. They make less smoke under any conditions than higher volatile coals, but, on the other hand, they make more smoke than the best Welsh fuels, and

there is plenty of Pennsylvania coal that has just as much right to be called "smokeless"; in fact, more so than any New River coal.

The proper term for these coals when they are to be described in "smoke terms" is "low volatile." The coals from the No. 1 or Eagle and the No. 2 or Gas seams of West Virginia are called "semi-smokeless" fuels, and, with the New River and Pocahontas, it is said, "will be the fuels which will be used at the canal." Coals containing from 27 to 35 per cent. volatile, as do the Eagle and No. 2 Gas coals, can hardly be termed even "semi-smokeless." They will never be used at the canal, because they are lower in heating value and not as good steamship coal as the New River-Pocahontas, in addition to which they are much more "smoky."

The proper field for the Eagle coal is in making by-product coke, for which purpose it is the best coal in this country when used unmixed. The No. 2 Gas coal has its field as a locomotive fuel, in making gas, for general steam use in nearby territory where the freight rates are in its favor, and in mechanical stokers. It is also extremely doubtful if the Kanawha splint coals are, as stated, "well suited for gas making."

Briquetting West Virginia Coals

There is another branch of the South American export coal trade that Mr. MacCorkle does not touch upon, probably because the West Virginia coal interests have never looked into it sufficiently. This is the making of briquettes. While the use of briquettes in the South is small, compared with that of raw coal, it is well worth looking into. In 1912, for instance, 453,000 tons of briquettes were shipped from South Wales to South America, Central America and Mexico, including:

	Tons
Peru	23,500
Chile	138,823
Argentine	33,300
Brazil	209,300
Uruaguay	7,700
Venezuela	16,700
Guiana	3,100
Costa Rica	4,500
Total	436,923

The establishing of a briquetting plant for New River-Pocahontas coals, either at tidewater or, preferably, at the port of consumption, such as Rio Janeiro, would enable briquettes from these coals to compete on favorable terms with those from South Wales. The cost of such a plant of 300 tons daily capacity would be about $100,000 at Hampton Roads.

The cost of briquetting at Rio would be approximately $1.20, which, with coal at $6.25, would make the total $7.45. The c.i.f. cost of South Wales briquettes at Rio today is about $8.26, the cost f.o.b. Cardiff being $5.10. To this must be added the cost of discharging, about 50c., making a total of $8.76.

As to quality, briquettes from New River-Pocahontas are superior in heating value, and just as good structurally and mechanically. The following is a comparative analysis:

	New River	Pocahontas	Cardiff "Star"	Cardiff "Crown"	Swansea
Fixed carbon	72.74	76.13	72.44	74.48	72.73
Moisture	2.70	1.06	0.80	1.46	2.70
Volatile	20.26	17.30	17.86	16.35	16.13
Ash	4.28	5.51	8.90	7.71	8.44
Sulphur	0.81	0.65	0.81	0.91	1.07
B.t.u.	14,886	14,836	13,446	13,499	13,241

These analyses of New River-Pocahontas coals were made from samples taken by the U. S. Geological Survey in 1907, briquettes made from run-of-mine coal. The Welsh analyses were from samples of actual shipments, the briquettes made from dock screenings and slack.

For making briquettes at Rio Janeiro or other unloading ports, sufficient screenings could be taken out of the run-of-mine coal, which would solve, to some extent, the problem of getting more lumpy coal for steam users.

This whole question of our coal exports and their possible increase is so important to the operators, shippers and allied interests that we should be careful to have full, reliable and accurate information. We should go into this matter with open minds, ready for any suggestions, willing to make use of the experience of our competitors, working out our method of operation on a systematic basis and investigating carefully each point. Our efforts should be continuous and not spasmodic, as they have been in the past.

Celebrating the Fourth in the West Virginia Camps

The Fourth of July was celebrated in the mining camps of the southern half of West Virginia on the most elaborate scale those camps have ever seen. Instead of being isolated places on Independence Day, as is generally the case, they were centers of gayety and the larger towns near them were deserted.

As a result of several weeks' planning the celebration began early in the morning and folk from the farms and the various country towns assembled in the mining camps. They made merry from sun-up until late in the night, as the guests of the coal operators and miners. Heretofore it has been the custom all over West Virginia for the railroads to run excursions from the mining camps to the towns in the several parts of the State. This year the process was reversed. Excursions were run from the county seats and the large towns along the lines to the mountain villages.

The celebration, in every instance, was in charge of committees composed of operators and miners, equally represented. In some communities several mining operations joined forces and the committees of arrangement were composed of employers and of employees from each of the participating mines.

West Virginia miners and operators decided to go back to the days of the fathers in the manner of observing the day. There was no work in the mines. The fun began early in the morning with the arrival of the farmers and their families with well filled baskets. These baskets were put on the tables with those brought by the families of operators and miners, and when the time came to feast, all lunched together.

After the arrival of the farmers with their teams and the people from the towns on the excursion trains, the celebration began with the reading of the Declaration of Independence and everybody sang "My Country 'Tis of Thee." Just as in the long ago, there was the Fourth of July oration. Every place of observance has procured some speaker of note. Young lawyers, middle-aged and old statesmen and politicians of all shades of political opinion told of the heroic deeds of the "boys of 1776" and of the greatness of this country. After the speeches the bands played "The Star Spangled Banner" and the lunch baskets were attacked.

In the afternoon there were baseball games, athletic contests and music by the bands. The operators and the miners joined in contributing to a fund sufficient to give everybody at least two "pokes" of ice cream.

The celebration ended with the fireworks at night. Hundreds of dollars were spent at each place for these fireworks and experts were on hand to set them off. At one place, where the mountains entirely surround the camp, men were stationed on the tops of the hills and at a given signal they blazed out three miles of red, white and blue light, while the miners, operators, farmer folk and townspeople stood bare-headed and the band played the national anthem.

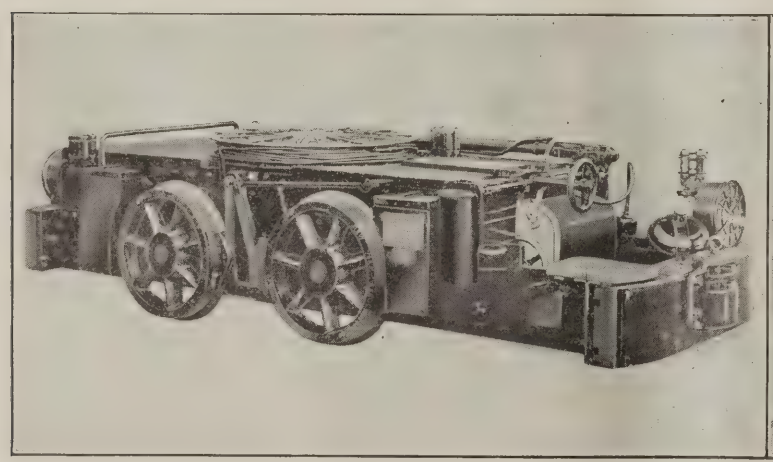
In thin seams, even where the coal is cut by hand, a conveyor reduces the loading cost considerably, because the miner is saved the labor of double shoveling the coal to the car.

Electricity in Coal Mining

By David R. Shearer*

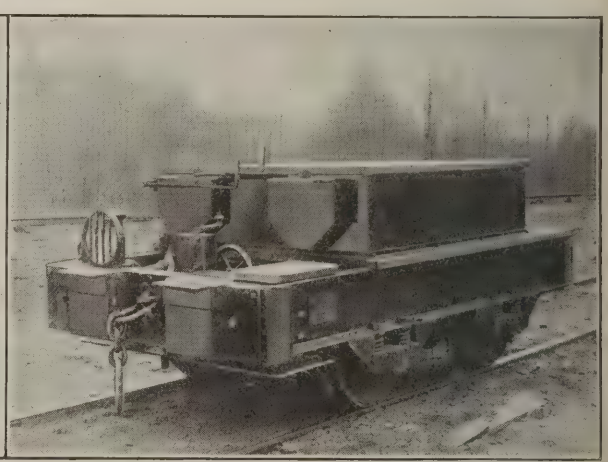
SYNOPSIS—This is the sixth article of the series on this subject. The essential differences in the various types of motors, series, shunt and compound wound, induction and synchronous are explained, as well as the distinctions between various types of locomotives ordinarily used in coal mining.

A motor is essentially a machine for changing electrical energy into mechanical power and is used at points where this power is needed for driving machinery. Two classes of motors are in common use, those used on alternating current and those used on direct. Each of these classes is then further subdivided into a great many types, each type having operating characteristics peculiar to itself and each suitable to certain kinds of work.



Considering the direct-current motor first, we find three types in use, the series, shunt and compound wound The chief characteristics of the series motor are that it has a large starting torque, is easily controlled in speed by resistances and varies in speed almost in direct proportion to the load. For these reasons, series motors are nearly always used on mine locomotives, hoists and other machinery operating at various speeds.

The real difference in these three types of motors is found in the field windings. In the series motor, the entire line current passes through the field and then through the armature, thus, when heavily loaded, the field is much stronger than when lightly loaded, the strength of the field varying in proportion to the line current. In the shunt motor, the field takes a definite amount of current continually, this amount depending not on the motor load but on the line voltage. Since the line voltage drops slightly, when the motor is heavily loaded, the field is to some extent weakened.



As a constant field tends to produce a constant speed, we secure a close regulation. If we weaken the field of a motor, the speed increases, and if we strengthen it the speed decreases. Thus a series motor without a load may run away and destroy the winding since the field is very weak when the motor is doing no work. The compound motor has both a series and shunt field and thus partakes of the nature of both of the preceding types.

Interpoles Are Now Frequently Used

Within the last few years an additional winding on the field of a motor has come into extensive use. This is called the interpole winding and is placed on auxiliary poles located midway between the main poles. The chief use of these additional poles is in reducing the sparking at the commutator.

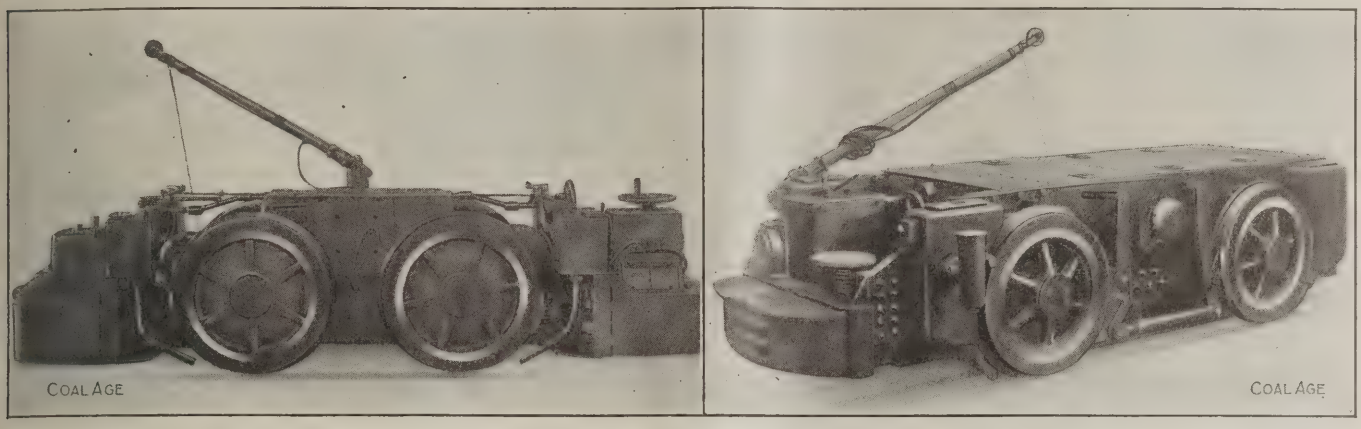
A Gathering Locomotive

A Storage-Battery Locomotive

The shunt motor operates at very nearly the constant speed for which it is wound. The speed, however, drops to some extent upon the application of a heavy load but usually only a small percentage of the normal rating. Shunt motors are suitable for the operation of many types of machines, fans, pumps and other mechanical equipment not requiring a great variation in speed.

Compound motors, especially when equipped with interpoles, are used probably more than any other kind. The characteristics of this motor lie between those of the series- and the shunt-wound machines. They have the advantage over the shunt motor in that they start with a higher torque and are capable of assuming greater overloads. Such motors are suitable for operating practically every kind of machinery except that which requires great variations in speed, although some types of variable-speed compound motors are on the market.

In alternating-current motor practice, we have two general classes, single phase and polyphase. Although single-phase motors are used to some extent, the operating characteristics are not very satisfactory, owing to the difficulty of bringing the machine up to speed. The polyphase motor, however, and especially the three phase, is quite satisfactory in operation and rugged in construction. Three general types of the polyphase motor are in use, the squirrel-cage induction motor, wound-rotor induction motor and synchronous motor.



The squirrel-cage motor is similar in operating characteristics to the shunt motor, but has the advantage that no open contacts, brushes or commutator are used. Taking everything into consideration, this is probably the

*Knoxville, Tenn.

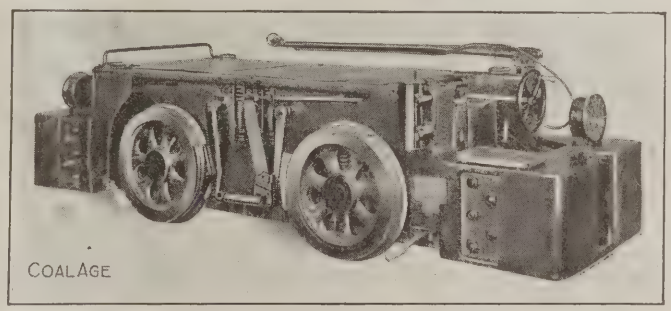
most rugged motor now used, the chief disadvantage now being that the speed is not easily varied except by a rather complicated method of changing the number of poles in the stator.

The wound-rotor motor is used almost exclusively where speed variations are necessary. As regularly equipped, a speed variation of 50 per cent. is possible by introducing a variable resistance in the rotor circuit. This motor, however, has open contacts as the windings on the rotor are energized through three set of brushes running on slip rings.

The synchronous motor is rarely used except in large units, as the starting torque is very low without a special induction winding for starting duty. When the machine is brought up to speed, however, it keeps in exact step with the generator supplying the current. Probably the greatest use for these motors is in substation work, where a synchronous motor is direct-connected with a continuous-current generator. Synchronous motors are often used for power-factor correction, since from the nature of the machine, when running with over-excited fields, it produces a leading current and thus counteracts the lagging current found on a supply system loaded with induction motors.

TWO TYPES OF TROLLEY LOCOMOTIVES

DIRECT CONNECTION MAY OFTEN BE MADE



In the use of electric motors for mine service in connection with the various machines, found in such an operation, the characteristics of both alternating- and direct-current motors are such that in many cases they can be driect-connected or geared to the driven shaft in this manner, eliminating to a large extent friction losses and the first cost and upkeep of belts and countershafts. It is also possible to use a motor with each individual machine, obviating almost entirely line shafting and hangers.

This use of individual drive tends to increase the efficiency of a mining operation because no machines or shafts need be run except those actually in use. In the older methods, when operating by the use of the steam engine, the greater portion of shafting and belting was running continuously, thus increasing friction losses by an appreciable amount. In operating crushers, the momentum of the rotating part in a motor adds a flywheel effect which is perhaps of some advantage over a belted connection from a line shaft.

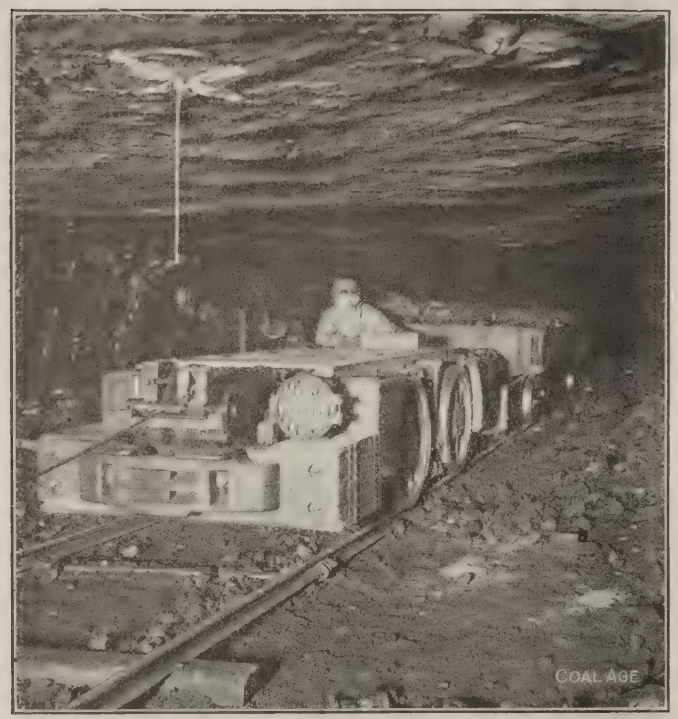
Practically all motors for use on both direct and alternating current are capable of carrying extremely heavy momentary overloads and 25 per cent. overload continuously without overheating. Ordinarily, the temperature rating of motors is considered 40 deg. C. (104 deg. F.) above the surrounding air when operating fully loaded and 55 deg. C. (131 deg. F.) under 25 per cent. overload.

Another advantage obtained in the use of individual motors is the ease with which power measurements may be made, for since each motor and the machine which it is driving forms a unit, instruments may be connected temporarily in the lines and actual power measurements of the machine load taken. This is of great advantage in that a machine may be worked at its full rated output and at maximum economy. This measurement also forms a check upon the operation of the motor, showing when it is overloaded or in need of repairs.

Still another advantage is in regard to peaks or overloads occurring at different points in the plant. The peaks rarely ever come on several machines at the same time, thus the electrical wiring system is in a sense distributive, supplying excess current immediately to those points which are overloaded. Any one of the motor units may be shut down temporarily for adjustments or repairs or even moved to another location with absolutely negligible effects on the remainder of the system.

A STRAIGHT HAULAGE LOCOMOTIVE

The ease of connection, flexibility and lightness in weight of electrical motors renders possible the use of portable machines and changes as to location or arrangement of machines in use may be made without interfering with the operation of the remainder of the equipment.



THERE IS A TENDENCY TOWARD STANDARDIZATION

The tendency in electrical-power applications to the use of coal mines is toward standardization, either in the

use of direct current throughout or by using synchronous or induction motors for work on the surface and direct current supplied by rotary converters or motor-generator sets for mine haulage.

In the use of a suitable power for mine haulage, the advantages and superiority of electric locomotives is generally conceded. This is due to the fact that an electric locomotive may be small in size, compact, simple of control, highly efficient and of great mechanical strength. Although compressed-air locomotives have been used to some extent, their efficiency is very low and at best they are cumbersome and require frequent charging from air lines laid in the mines.

Steam locomotives are almost entirely ruled out of mine work, owing to the large space required for their use and a smoke and fire hazard. Gasoline locomotives, too, have been used with some success, but are sometimes difficult to start, not able to withstand heavy overloads,

A Crab Locomotive at Work

they are expensive to maintain and have a lower tractive effort than an electric locomotive of corresponding size.

The life of a trolley-type electric locomotive is long. One is known which has been in use almost constantly for twenty-two years. No doubt, any other type of haulage motor would have been in the scrap pile after ten years' use.

Electric locomotives secure current for their operation by two methods. In one, the most commonly used, a trolley wire is carried on insulating supports into the mine above and alongside of the track. This forms one line of the electric circuit, while the rails upon which the locomotive runs form the other. Another type of locomotive secures current from a storage battery carried on the frame of the machine, which is charged at regular intervals from a direct-current supply.

There Are Three General Types of Trolley Locomotives

Three general forms of trolley-type electric locomotives are now in use, the straight haulage, cable reel or gathering and a combination or crab type. The standard weight ranges from two to 30 tons and some of the smaller sizes do not exceed 28 in. in total height. The straight haulage type is of undoubted value in hauling cars to the shaft or tipple in a mine having reasonably long haulage. This type is in use in practically all mines where electric service is available. For this service, the use of mules has practically been discarded, since one locomotive can deliver considerably more tonnage than several animals, can move faster, enter lower tunnels and, if necessary, operate continuously.

Gathering locomotives are very similar to the straight haulage machines, but in addition have a rotating reel operated by a small auxiliary motor, which carries a long length of electric cable, so that a locomotive of this type is able to go into cross-entries where there is no trolley line and be fed by current supplied through this cable, which it reels off on the ground when leaving the trolley line and winds up as it returns to the main track. The operation of this reel is entirely automatic, so that the driver may give his entire attention to the operation of the main or driving motor.

The crab-type locomotive is similar to the haulage machine, but with the addition of a hoisting drum operated by a strong compact series motor. A locomotive of this type may be blocked in an entry and by means of the hoist rope draw the loaded cars up the slopes and deliver them on the main haulage track. A few locomotives have been equipped with both the hoisting drum and cable reel, so that they may be used for practically every service required in haulage operation. Locomotives of these three types are shown in the accompanying illustrations.

In the operation of mines located a considerable distance from the tipple or breaker, it is possible to advantageously use much larger locomotives than those just mentioned. Since compactness is not required of these machines they may be of larger size and heavier framework.

Some makers use one motor only on a locomotive, connected to both axles by means of some form of gearing, others use separate motors connected to each axle. As a usual thing, the controller and all the more delicate parts, if any part of a mine locomotive may be called delicate, are thoroughly housed in, so that damage from falling rock, derailment or ordinary accidents is almost impossible. The controller is usually of the drum type, which consists of a series of contacts turned against a corresponding series of fingers placed in a closed steel case.

Some haulage motors are equipped with a heavy steel pinion, placed on the axle midway between the driving wheels, which engages a rack located in the center of the track, so that on heavy grades slippage is obviated and a high tractive effort is obtained.

The Storage-Battery Locomotive

The use of storage-battery locomotives is coming into extensive use, especially since marked improvements have been made in storage batteries within the past few years. When accumulators were first developed, the weight for a given output of current was out of proportion and the battery was to a certain extent fragile and liable to breakage, but some of the modern types not only withstand rough usage, but have exceptionally large output for a given weight.

As a usual thing, two motors are used on this type of

locomotive, each directly connected to a driving axle. The great advantage in the use of storage batteries for this work is that no trolley wire is required and the machine can go and come wherever the track is laid, regardless of connection with an outside source of current.

The chief objection to these machines is that they must receive regular charges and therefore be out of service part of the time. The storage-battery machines are built in sizes from two to ten tons and several makes of batteries can be supplied with any standard locomotive. Thus the buyer is enabled to choose to some extent the battery he intends to use.

The cost per charge for a storage-battery locomotive depends, of course, upon the size and the type of battery used, as well as upon the source of power and the efficiency of the charging equipment. The frequency of charge depends upon the conditions to be met, upon the load hauled and the number of hours per day in use. The number of ton-miles it is possible to secure from one of these machines upon one charge ranges from 100 to 200 at a speed from two to five miles per hour.

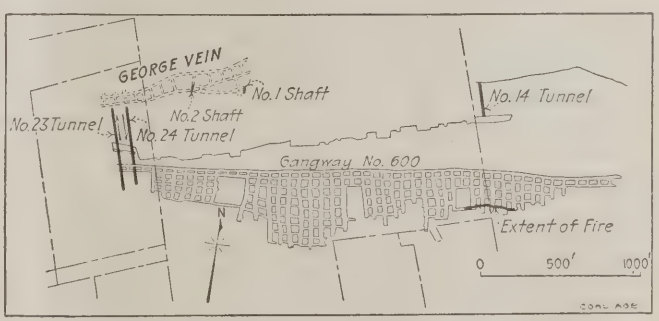
It is advisable in many cases to place a wattmeter or ampere-hour meter on an electric locomotive in order to check operating efficiency and determine if the operator uses sufficient care in conserving current. A registering instrument of some kind is especially necessary on storage-battery locomotives since this instrument forms the easiest method of determining when the machine needs a fresh charge.

Several illustrations, showing locomotives of the types mentioned, accompany this article, and much valuable information may be secured from the manufacturers covering the details of these machines, operating characteristics and cost per ton-mile of haulage.

The Auchincloss Mine Fire in the Anthracite Regions

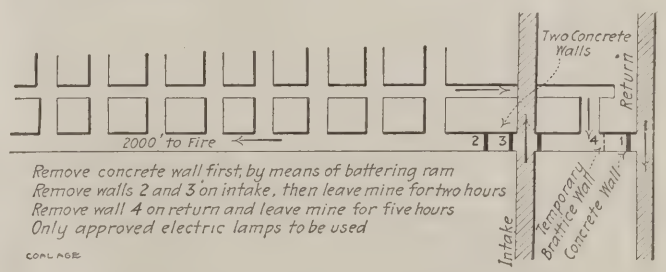
By P. H. Dever*

SYNOPSIS—Brief description of what threatened to be a serious fire in a very gaseous district. The article includes a valuable table giving the variations in the evolved gases at different stages of the trouble.



On the morning of Nov. 17, at about 10 a.m., a mine fire occurred at No. 2 shaft, Auchincloss Colliery, located in the borough of Nanticoke, eight miles south of the city of Wilkes-Barre. The mine is operated by the D., L. & W. R.R. Co.

The coal seams are being developed by two shafts, 14x50 ft. in size, each having two hoistways, one pumpway and one return airway. The shafts are located on the same surface elevation, namely 722 ft. above tide and 300 ft. apart. The deepest, or Red Ash bed, is penetrated at an elevation of 1000 ft. below tide. The part of the mine in which the fire occurred is locally known as the Nos. 23 and 24 tunnel section; these tunnels are located 500 ft. west of No. 2 shaft at an elevation of 95 ft. above tide in the George seam landing. They have been driven from the south dip of this seam across a synclinal to the George, Mills and Baltimore seams on the north dip; they are 600 ft. long, have a uniform rise of 2 per cent. and are 7x12 ft. in section. No. 24 tunnel is used as an intake airway and for haulage purposes, and No. 23 is used as a return airway. The tunnels are parallel and 60 ft. apart. A guibal fan, 35 ft. in diameter and running 52 r.p.m., with a water gage of 3 in., is employed for ventilating the workings in No. 2 shaft.



The air passing through this section of the mine is divided into two splits, 20,000 cu.ft. per min. passing through the Mills seam workings (fire section) and 40,000 cu.ft. passing through the Baltimore workings. An analysis of the return air shows 2 per cent. CH_4.

According to the second geological survey, the mine is located in the most disturbed part of the anthracite coal field. The various seams south of the shafts rise vertically 750 ft.

The employees working in this part of the mine use locked safety lamps, of the bonneted Clanny and the Acroyd & Best types. The coal is shot from the solid in both seams by means of Monobel No. 4 powder, tamped with clay and fired by electric battery. A patrolman is on constant duty for the purpose of seeing that no blasts are fired in places containing firedamp, and to look after the general safety of the workmen. But, notwithstanding these precautions, a serious fire started at the face of chamber 35, which is 2700 ft. east from No. 24 tunnel in the Mills seam. The chambers here are driven directly up the pitch, which is 25 deg., and the coal is eight ft. in thickness.

Sketch Showing Location of Fire

Plan Showing System of Recovery

*Coal-mining department, D., L. & W. R.R., Nanticoke, Penn.

Origin of the Fire

The fire is supposed to have been started by the breaking of the glass of a safety lamp dropped by a miner, the unprotected flame igniting some very strong gas feeders, which soon set the brattice and timber afire and finally the coal. The foreman and his assistant, being in another part of the mine, were promptly notified of the danger, and after a hurried examination they found that the fire had traveled through the crosscut leading to chamber 34.

While engaged in the work of fighting the fire, using water and chemical hose, it was discovered by the officials that the air current coming from the inside section contained 3½ per cent. CH_4, whereupon all persons were removed from the mine, and after a consultation it was decided to seal the affected section. While making preparations for doing this were under way, an explosion occurred, doing considerable damage to the mine and also destroying the ventilation. Temporary stoppings of brattice cloth were used in order that the recovery work might be done quickly and the men removed from the mine, care being taken to seal the return side first. About ten hours after installing the temporary stoppings, permanent concrete dams were erected, the return side, as before, being sealed off as in the case of the temporary first. Additional dams, forming an air lock, were then built in the intake and the walls were provided with a 2½-in. pipe, for obtaining gas samples for analysis and for water-gage readings.

On Dec. 6, nineteen days after the sealing up of the fire, Assistant Division Superintendent P. H. Dever, accompanied by foremen White, Richards and Thomas, equipped with Draeger helmets, made an inspection of the fire zone and found it to be entirely extinguished, the temperature on the gangway at the entrance to chamber 35 being 68 deg. F. The temperature at the face was 78 deg. and the rock and coal were still warm, but no sign of fire was found. It was then decided to restore ventilation, which was successfully done, using the method outlined on the accompanying drawing.

On Sunday, Dec. 7, all the CH_4 had cleared, which permitted us to make a minute inspection of the workings, after temporary stoppings were erected. We then learned that the explosion on Nov. 17, had been quite violent; all concrete stoppings, which were two feet in thickness, were blown out and pulverized. Several loaded cars were upset and broken, sheet iron, props, planks, etc. were carried several hundred feet from the point where they had been left.

Recently we drilled an 8-in. bore hole to a depth of 450 ft. from the surface to reach the Baltimore seam in the No. 24 tunnel section, on the apex of the anticline, The gas pressure generated in two minutes was sufficient to blow a yellow-pine plug, weighing 31 lb., 20 ft. vertically out of the drive pipe after it had been hammered down in the hole with a 10-lb. sledge.

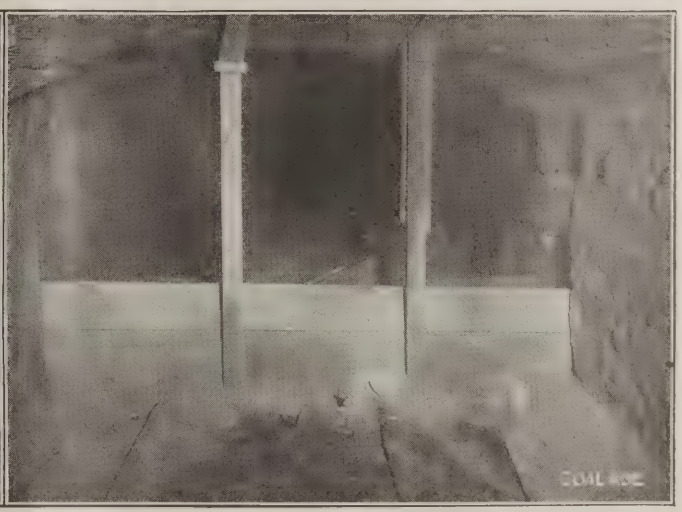
Note—⅓ of the vol. of CO_2 in CH_4 will make it non-explosive.
Note—**Full face** type indicate an explosive mixture of fire damp.

Of the total of 2444 coal cutters in use in 626 different British mines in 1912, 1134 (of which 593 were in Scotland and 290 in the Yorkshire district) were electric, against 1310 driven by compressed air. This was an increase of 136 electric and 162 compressed-air cutters. The mineral cut by electricity was nearly 12 million tons, as against about 8½ million tons by compressed air. Among the electrical coal cutters, there were 623 disk machines, 345 bar machines, 148 chain machines, 14 percussive machines and four rotary heading machines.

Coal-Dust Explosions at the Mine Inspectors' Institute Meeting



By George S. Rice* and L. M. Jones†

SYNOPSIS—A mild explosion was staged at the experimental mine, the mixture of rock dust with coal dust being almost sufficient to make the explosion impossible. Under these conditions the Rice barriers proved effective. The explosion was more violent toward the intake, and more speedy toward the return. However, neither difference was sufficient to establish any conclusions.

Test known as No. 120 of the series now being made at the Bruceton experimental mine was conducted in the presence of many members of the Mine Inspectors' Institute of America, who were assembled from various parts of the United States and Canada on June 11, 1914. Some operators and miners were also present. The purposes of the experiment were several: The most important was to determine the efficiency of various forms of rock-dust barriers in stopping the propagation of a dust explosion; another feature of great interest to many of the members, was the employment of a strong ventilating current prior to and at the time the explosion was started. The main entry was the intake and the aircourse, the return. The loading of coal dust in the two entries was made as nearly alike as possible and since the igniting shot was fired in an offset at the middle of the inmost crosscut, the conditions in the two entries were identical, except for the air current intaking on one and returning on the other entry.

Rice Concentrated Rock-Dust Barrier in Main Entry, after Explosion

Rock-Dust Stopping in Stub Heading to Right of Main Entry, after Explosion

Conditions of Test

The explosion was caused by a blownout shot of 4 lb. of FFF black powder, tamped with 3 lb. of clay stemming, discharged from a cannon at the face of a 20-ft. offset, on the north side of the 1250 crosscut at a point equidistant from entry and aircourse. (See figure on page 67.). The offset and 1250 crosscut were loaded with pure coal dust; that is, coal dust not mixed with other material. The distance from the cannon through the crosscut to the center of either entry was about 50 feet.

From opposite the 1250 cut-through, the entry and aircourse were each loaded on sides and cross shelves with a mixture of 60 per cent. coal dust and 40 per cent. shale dust at a rate of 3⅓ lb. per ft. The amount of coal dust per foot of entry way was 2 lb., which is equivalent to about one-half ounce per cubic foot of entry space. This loading extended for 550 ft. outby from the crosscut. The mixture had an ash percentage of about 38 to 40 per cent.

Concentrated Rock-Dust Barrier

At the end of this zone on the entry there was installed a Rice concentrated barrier loaded with 2½ tons of rock dust. The principal features of the barrier are as follows:

It has two hinged platforms, 7x7x1 ft., near the roof of the entry. The floor planks of the platforms are not attached to the side boards which are fastened to timber crossbars but are hinged at one end to the crossbar of a timber set, between the platforms. The other ends of the planks of each platform are supported by an angle iron, which in turn is held up by one of a system of levers.

There are vanes hung from the roof 100 ft. distant inby and outby the barrier, so arranged that when an explosion wave causes one to swing, the movement is reversed by a pulley and chain and a pull transmitted by wire to a trigger which trips a system of levers causing the dropping of the angle irons supporting one end of each platform. Alternate planks then fall about 9 or 18 in., depending on the length of chains fastening them to an overhead timber or to the roof. The side frame of each platform, however, is still held in position.

On release, the dust, which has been placed on the

*Chief mining engineer, Bureau of Mines, Pittsburgh, Penn.
†Assistant mining engineer, Bureau of Mines, Pittsburgh, Penn.

platforms, falls from the planks in a shower into the entry, blanketing the flame of the explosion as soon as it reaches the barrier. Should the advance-vane operating arrangement fail, another vane near the barrier, by means of a hinged bumping block attached to it, pushes the trigger, causing the barrier to act.

Box Rock-Dust Barriers

At the end of the mixed-dust zone on the aircourse were installed a set of 6 Rice box barriers, spaced 10 ft. apart from center to center, each containing from 600 to 700 lb. of crushed-shale dust. These boxes are 7 ft. long, 21 in. wide inside and 9 in. deep. They are built so that two bottom boards rest upon narrow bottom strips fastened to the box frame.

This frame is supported by 4 eyebars, the eyes resting on hooks, projecting from the roof. When the explosion wave reaches the box, it causes the latter to swing in the direction the wave is traveling until the side of the box knocks 2 hanging bars off the hooks, whereupon the frame falls, pivoting about the supporting hooks on the other side of the box, to which the other 2 eyebars are still attached.

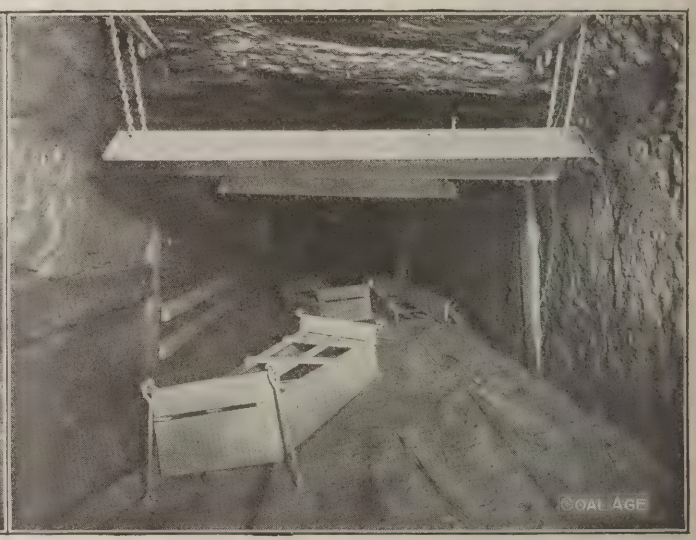
The bottom boards do not fall with the box frame but drop a few inches when they are caught by supporting chains. More or less of the dust on these shelves either falls off as they swing or is blown off by the explosion wave. With a light preliminary wave, considerable dust may remain on the shelves which is a measure of protection against a following explosion wave.

Coal Dust Loaded beyond Barriers

Outby from both the concentrated barrier and the box barriers, were arranged 200-ft. zones of pure or unmixed coal dust to furnish fuel for continued propagation of the explosion, should it get through the stopping devices. These zones were intended to determine if the barriers just described performed their duties effectively. At the end of these coal-dust zones were placed Taffanel barriers to check the explosion should the coal dust become ignited.

First Right Butt

Across the mouth of this entry was built a rock-dust stopping which consisted of board sides with a compartment between them, 18 in. wide, filled with 2½ tons of shale dust The sides were braced just sufficiently to withstand the pressure of the dust filling, but not enough to give much additional strength. Coal dust was placed for 100 ft. inby from the stopping to test its efficiency.



First and Second Left Butts

In these entries, 15 ft. in from the aircourse, were built rock-dust protected ventilating doors. These doors had compartments at each side and above them, containing rock dust. The door frame held the boards of the compartments in place. When an explosion wave struck the door, the frame not being strongly braced would tend to become displaced and the rock dust would be launched into the entry. The door in No. 2 butt opened outward, while that in No. 1 butt opened inward.

Unmixed coal dust was distributed in both butt headings to determine the efficiency of the stopping devices. To obtain symmetrical conditions in the aircourse and entry, no door or curtain was placed across the aircourse between the butts.

Rock-Dust-Protected Ventilating Door in Left Butt after Explosion

Rice Box Barrier in the Return Aircourse after Explosion

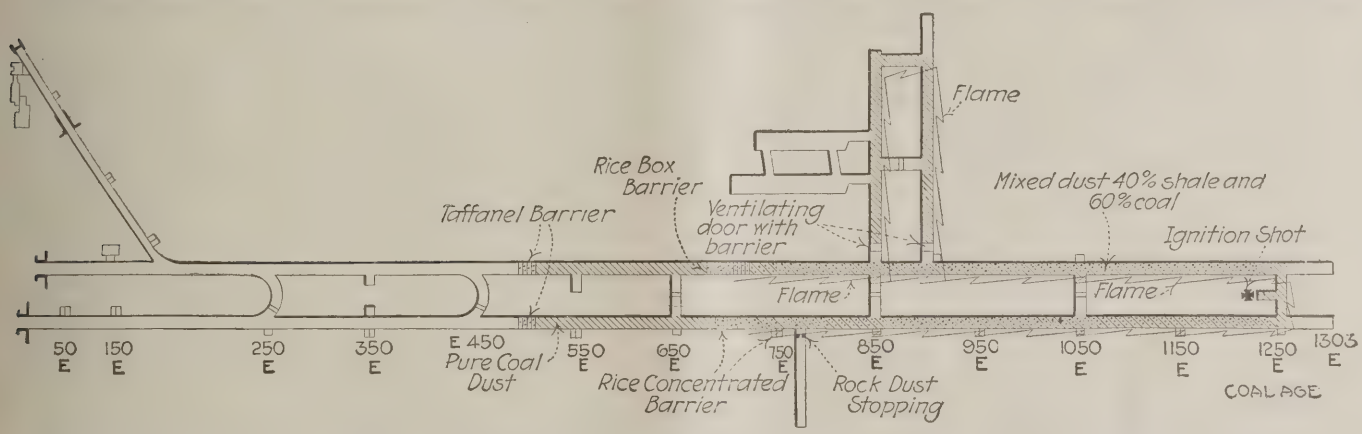
Ventilation and Humidity

An air current with a velocity of about 850 ft. per min. was intaking on the main entry and returning on the aircourse. It was thought that the symmetrical loading on the two headings would permit the observers to compare the relative violence and extent of the explosion in the face of and opposing an air current of high velocity, which gave, in this case, a volume of 46,000 cu.ft. per minute.

The mine was wet throughout, and in places the bottom was muddy, while the packed clay floor was everywhere slightly sticky. The roof was studded with beads of moisture.

Recording Instruments

Recording pressure manometers were placed in stations E-1150, 750, 550, A-1150, 750 and 550. Flame circuit breakers were placed at all stations in the mixed-dust zone, and others at intervals outby. Wires were connected to the stopping devices, terminating the mixed-dust zones, to determine the relation between the time of their operation and the passage of the flame. Matches and guncotton tufts were installed every 25 ft. throughout the mine.



Explosion Appeared Mild at Mine Mouth

When the igniting shot was fired by the pressing of a button in the observatory, slight puffs of dust were noticed at the main entry and aircourse, accompanied by a muffled report. Shortly afterward more dust came from the entrances, particularly from the aircourse, and issued for some length of time. Externally the evidences of the explosion were not very marked. When the ventilating current was turned on after a cloud of rock dust had been expelled, the afterdamp accompanied by an extensive cloud of black smoke attested to a considerable explosion in the interior of the mine.

Extent of the Explosion

The flames of the explosion extended in the main entry and in the aircourse to the respective rock-dust barriers, which were placed at points 550 ft. from the outside of the mine or 700 ft. from the origin in each case. The barriers in both cases operated and flame was not communicated to the pure coal-dust zones beyond or outby the barriers.

The ventilating door in the second butt was evidently

Plan of Experimental Mine, Showing Manner of Charging with Coal Dust and Methods Adopted for Retarding and Extinguishing Flame

thrown down by the shock wave from the cannon, as indicated by the elapsed time as recorded on the chronograph. When the flame reached it, about 4 sec. later, there had been sufficient time to permit the rock dust to settle, so that the flame passed overhead and ignited the coal dust beyond, with the result that there was quite a strong inflammation at the head of the butt entries, sufficient to break the track and throw down shelving.

This indicated that the door frame had not been built with sufficient strength, because, for the proper operation of the rock-dust device, the frame should not have been thrown down until reached by the main explosion. This was the case with the first left butt ventilating door, probably because this door opened inward. The barrier surrounding this first left butt door was thrown down apparently by the main explosion, although it is not perfectly clear from the time records whether it may not have been thrown down by the explosion which came around from the second butt. In either case there was apparently sufficient rock dust launched into the air to quench the strong explosion coming out of the butt headings.

Pressures Produced by the Explosion

The pressures as recorded by the different manometers showed that the explosion was light, partly due to the dust being mixed, and perhaps also due to the wet condition of the mine. The maximum pressures at E-1150 was 2.4 lb., at E-750 5 lb. and at E-550 0 lb. The pressures at E-750 and 550 show the effect of the concentrated barrier in extinguishing the flame. In the aircourse the pressure at A-1150 was 1.4 lb. and at A-750 1 lb. This latter pressure, in view of the considerable development of force at the head of the butt entries, is rather surprising and indicates that the ventilating-door barriers in the butt entries, if they did not stop the explosion on entering, did so on the return wave. At A-550, outby from the box barrier, the pressure was zero.

Velocity of Explosion

The velocity of the explosion was slow; one of the slowest that has been recorded. It required 3.2 sec. to traverse a distance from the origin to the station at E-1150 in the entry, a distance of 150 ft., and 2.9 sec. to station A-1150 in the aircourse, also 150 ft. from the origin. The explosion required 6.5 sec. to reach station 750 in the entry and 5.1 sec. to reach the corresponding station in the aircourse. The average velocity of flame between stations on the return aircourse, 183 ft. per sec., was greater than the average velocity of flame between stations on the intake entry, which was 131 ft. per second.

Effect of Ventilating Current

It would not appear from the pressure and velocity records that the high velocity of the air current had much influence on the development of the explosion. About the only variation in the action of the explosion in the two entries was that the velocity of flame on the return side was somewhat greater than that on the intake side. While this may have been an effect of the ventilating conditions, it was probably more a matter of chance than an effect of the air current, since the explosion was so slow.

Concentrated Barrier

As the explosion was light, the concentrated barrier in the entry was not broken up or injured. The shelves had dropped until the supporting chains were taut and about 80 per cent. of the dust had fallen from them, the remaining 20 per cent. being still retained on the planks. The barrier operated 5.44 sec. after the shot was fired, while the flame reached it about 7 sec. after the shot; the rock dust that sifted down apparently made a sufficient curtain of dust to extinguish the flame.

Box Barriers

The box frames were found lying on the floor of the entry, only one being damaged to any great extent. The bottom boards were all suspended from the chains and only one had been broken. All the dust had fallen from the boards, which were supported at a tilted position. The boxes operated after 4.9 sec., while the flame reached the boxes about 5.5 sec. after the shot. The rock dust was well distributed along the air course.

Rock-Dust Stopping

The record indicated that this stopping had been blown down at least partially when struck by the shock wave from the igniting shot at a period 0.473 sec. after the shot. The stopping was probably built unnecessarily light. It operated effectively, for no flame passed it.

Rock-Dust-Protected Ventilating Doors

The door in No. 2 butt had been thrown down by the shock wave at period 0.429, while flame reached this point, it is estimated, after a period of about 4 sec. The dust compartment of No. 1 left door fell, according to the time of rupture of the wires, after a period of 4.9 sec., the flame reaching this point possibly a little before.

It is probable that the flame passed into No. 2 butt over the dust pile, which had fallen possibly enough in advance so that much of the dust in the air had settled. The flame may or may not have passed through No. 1 butt barrier.

The woodwork of both doors had been broken to fragments by the return wave from the butts and the fragments thrown out to the aircourse and lay in that heading, both outby and a short distance inby from the butt heading.

The failure of No. 2 butt door is undoubtedly due to the frame being braced too lightly. It should not have gone out with the shock wave. Also it would be better to hang some of the boards from the roof by chains, as in the case of the box barriers, in order to retain some of the dust for delayed flame.

Taffanel Barriers

All but one shelf of the Taffanel barrier in the main entry were thrown down by the explosion. All the shelves of the Taffanel barrier in the aircourse remained in place and about two-thirds of the rock dust was still on the shelves. Owing to the concentrated barrier and box barrier having stopped the flame, the Taffanel barriers were not brought into action.

Conclusions

The results are valuable as showing the effectiveness of the concentrated barrier and the box barrier in a weak explosion. Their method of operation permits a surer and more effective scattering of the dust than does the open shelf type of barrier, in which the amount of dust blown off the shelves depends upon the strength of the air current. In a weak explosion, the amount blown off might be too small to quench the flame effectively.

When putting down a diamond-drill hole in sandstone or limestone, the jamming of the drill when a water cavity is reached may be overcome by a good hydraulic feed. When the ground is rotten the hole should be lined to keep it from falling in, though this reduces the size.

The Lesson

By R. T. Strohm

Written expressly for Coal Age

There are lots of modes of teaching
How to order all our ways,
In addition to the preaching
In the churches, Sabbath days.
Though the parsons labor longer
To induce us to believe,
We may learn a lesson stronger
From a grease-cup on a sheave.

Not a whimper nor a grumble
At the irony of fate,
But instead, with manner humble,
Working silently and late.
No such weakness as resentment
Lurks within its grimy shell;
Filled with grease and deep contentment
It performs its duty well.

Every night its task is ended
Where its morning work began;
Though its travel is extended,
Yet it has not moved a span.
Still, dissatisfaction spurning,
It has jubilantly whirled,
Never tempted by a yearning
To be off to see the world.

Gamely it continues going
In its narrow little sphere,
And, in spite of usage, growing
More efficient, year by year;
Never longing for inaction,
Never seeking for a rest,
But, with quiet satisfaction,
Doing just its level best.

Utah Breaks Record

The production of coal in Utah in 1913 was 3,254,828 short tons, with a value at the mines of $5,384,127, according to E. W. Parker, of the United States Geological Survey. In 1912, for the first time, Utah's coal production exceeded 3,000,000 tons, the output in that year amounting to 3,016,149 short tons, valued at $5,046,451. In 1912 the industry suffered from a scarcity of labor, due to the exodus of foreign miners to the scene of war in the Balkan States.

The increased production in 1913 appears to have been due principally to activity among the metalliferous mines and the smelters, as nearly all of the increased production was in the quantity of coal made into coke, this item alone indicating a gain of 225,561 short tons out of a total increase of 238,670 tons.

Nearly 90 per cent. of the total coal production of Utah is mined in Carbon County, which contains a large part of the great Uinta Basin. This county produced in 1913 2,830,102 short tons, out of a total for the state of 3,254,828 tons. The industry was practically free from labor troubles in 1913, only one company reporting idleness from this cause, and only five men being disaffected.

The Labor Situation

SYNOPSIS—Several wage contracts have recently been signed. To western Pennsylvania and Iowa as states with completed contracts have been added West Virginia, as far as the union is recognized, and southern Ohio. A speedy agreement in Illinois is foreshadowed. In the other sections no approaches to a settlement have been made, but the effect of agreements elsewhere cannot fail to influence the result.

As stated in brief in last week's issue, the executive board of the United Mine Workers district organization (No. 17) in West Virginia declared the referendum vote in 19 out of 50 local unions had been cast illegally or returned in a manner not in conformity with the by-laws. It has been alleged that in two local unions more votes were cast than there were members on which capitation tax was paid to the organization, and in other cases the official seal had not been stamped on the returns.

ARBITRATION AND THE CHECK-OFF

The second vote was more definitely in favor of the arbitral proposition with the check-off than the first is said to have been. When the report was made, it was found that 1304 voted for the proposition and 949 against, giving a majority of 355 votes. As a result, it is said, 7000 men will go back to work.

The miners will now appoint a committeeman as they should have done long ago, had they acted in accord with the report of the board of conciliation. They will also go back to work, another point in which they failed to act as the board requested. D. C. Kennedy is appointed by the Kanawha Operators' Association as its representative on the arbitral commission.

THE AREA OF WEST VIRGINIA AFFECTED.

The strike commenced June 1, and has lasted barely over a month. Among the mines affected by the resumption are the Plymouth, Black Betsy, Raymond City, Blakeley, Campbell's Creek, Coal Fork, Quincy, Monarch, Shrewsbury, Ward, Mammoth, Big Mountain, Hughes Creek, Cannelton, Marting, National, Carbondale, Smithers, Longacre, Harewood, Boomer, Powellton, Elkridge, Columbia, Diamond, St. Clair, Eagle, Montgomery, Eureka, Crescent, Handley, Coalburg, Winifrede, Belmont, Crown Hill, Olcott, Rammage and Clothier.

The conclusion of the strike is hailed as a great victory for the administration by some parties. As a matter of fact, the only question at issue was the check-off, and as the operators realized that this did not come out of their own pockets, they were not disposed to make an urgent fight against it. Both parties conceded to the commissioners on the 10th of June that there was no wage dispute.

PAINT CREEK AND CABIN CREEK NOT IN THIS AGREEMENT

Nor does the decision, as has been reported, mark the end by conciliation and arbitration of the Paint Creek and Cabin Creek disturbance, for none of these mines is included in it, the mines along these creeks having settled their difference with the miners long ago. The area covered is quite restricted and does not even include the whole union field. Thus a 3-year working contract was concluded between the union and the operators of the Pomeroy Bend district of West Virginia on June 10 at Hartford City, Mason County. In this agreement also, the check-off was conceded.

On the 30th of June, the Scotford Mines of the Bell Coal Co. on Bear Creek in Clay Co., signed a working contract with the union. At last reports, the Four States Coal Co. and the Milburn Coal Co. were still idle. Now the dispute is settled with the Kanawha District Operators' Association, it is likely that the difficulty at the mines of these companies will be pushed to a conclusion.

THE SOUTHERN OHIO COAL FIELDS COMMENCE WORK

In Ohio, as we mentioned last week, the operators of the Hocking, Pomeroy, Jackson and Crooksville districts remained in session with the United Mine Workers after the eastern Ohio and Cambridge operators withdrew. As a result, the operators and miners finally agreed on a scale providing 47c. per ton of mine-run coal mined by machine, and 67.6c. for pick-mined coal.

The full text of the general agreement follows:

(1) All coal to be paid for on the mine-run basis.

(2) The price for machine-cutting, hand-drilling and loading of clean merchantable coal in wide work to be 47c. per ton.

(3) The price for pick mining to be 67.6c. per ton.

(4) The present differential above the Hocking Valley scale to be retained on a relative basis.

(5) All narrow work to be paid for in the same proportion as under the Cleveland agreement.

(6) The price now paid for inside work to be affirmed.

(7) Eight hours to constitute a day's work.

(8) All internal questions, both as to price or conditions, to be referred to the different districts for adjustment. In adopting the mine-run basis, it is proposed that the coal shall be mined in a careful, workmanlike manner and that, in all scale districts, a rule or rules will be agreed upon requiring that such be done.

When the agreement is ratified by a referendum vote of the miners in the districts affected, mining will be resumed. It is believed that the referendum vote can be taken and counted in less than two weeks. While the scale is not satisfactory to the operators they will make an honest effort to work under it. The Ohio Industrial Commission will now have the task of fixing rules to govern the percentage of slack and impurities.

Operators in eastern Ohio, Cambridge and a portion of Crooksville are arranging to meet the miners in conference next week. The miners insist they will not give a lower scale in the districts that have not signed up.

THE PITTSBURGH VEIN OPERATORS ASSOCIATION

It may be stated that the Pittsburgh Vein Operators Association feels much aggrieved at the statements made that it has been unreasonable. It states truly in a long advertisement in the "Martins Ferry Daily" of July 3, that it has been willing to sign the old scale as have the other operators in other districts, as for instance, those in the Pittsburgh region, but the union and the law demand alike a new scale. It has offered an equivalent scale giving 99c. for lump coal and 2c. for slack. It has also agreed to give 41.12c. per ton for run of mine, that being also, it declares, the equivalent of the Pittsburgh price.

The association quotes the failure of several companies working on a mine-run scale as evidence of the unfairness of the competition existing where a mine on that basis has to compete with one where only lump coal is paid for, though at a higher compensatory rate. It declares that the steady operation of the eastern Ohio mines which has been secured by the building of docks in the Northwest by the Ohio operators, will be entirely destroyed if the mine-run scale, which the union proposes and which the Pittsburgh vein operators declare is inequitable, is adopted. The latter claim that for 5 or 6 years, the dock trade, secured at much expense, has caused the eastern Ohio district to be more steady in operation than the adjoining fields in the same state.

THE QUANDARY OF THE OHIO MINERS

It is clear that the miners in eastern Ohio are suffering severely from the present idleness. They are certainly to be commiserated. They are victims of their own successes. They have long succeeded in holding the wages of the Ohio district, with its generally less desirable coal, on a level with those of the Pittsburgh region. As a result, the number of days worked has been low. In 1912, the mines in Ohio operated only 199 days as against 255 in the Pennsylvania bituminous regions.

The reason for their action in trying to maintain wages is perfectly reasonable. The coal is dirtier for the most part and needs more cleaning. The bands are often large and the removing of them troublesome. Why should not the wage scale be at least as high as where the coal is cleaner? The answer of the operators, which seems so hard to devise, is however easy—the coal being inferior must sell at a lower price, and if the miner and operator cannot agree to mine it at that price, they must leave the market. As the operators profits are infinitesimal, the only hope lies in the miner accepting a lower recompense or in his vacating the state of Ohio where only lower wages can be paid.

The miners assembled at Martins Ferry on June 26 and condemned the practice of sending away the money collected at home for the benefit of strikers elsewhere. They feel that if they had not done this in the past, none of them would have had to seek charitable relief during their present dispute.

Most energetic attempts have been made by the Industrial Workers of the World to induce the impoverished miners to

commit acts of violence, but to the great credit of the union miners, it must be said it has been entirely without success and it tends to prove that where the unions are strongly entrenched, they may tend to seek concessions which the economic situation does not merit but they do not evidence a disposition to riot. And it may be here stated that none of the strikers has received more than $1.50 since the strike started on the first of April. Their financial condition certainly is desperate; that their counsels are not equally desperate under the urgent incitation of unscrupulous agitators testifies to their law-abiding disposition.

The miners held a mass-meeting at Bellaire, O., in the auditorium of the city building. One resolution, apparently by an I. W. W. sympathizer, urged all miners' local unions to hold mass meetings to fix a limit of 15 days during which the operators were to be required to sign a scale as demanded by the officials of the organization and failing to reach an agreement by that time, all settlements to be declared off for a specified time. The resolution urged the state officials to raise funds to carry the strike to a successful issue, and also urged the investigation of the policy of the national organization in withholding benefits from the Ohio miners.

The second resolution, even more clearly coming from an I. W. W. source, urged "That we ask that all miners who are working, stop in sympathy with the Ohio miners and that if there is not a settlement soon, we ask that steps be taken to prevent the delivery of coal, which is now being hauled through Ohio, stopped."

The I. W. W. men tried to break up the meeting and the officials left in disgust. Police were summoned to the hall and an executive session was called, the reporters being expelled. The I. W. W. men were left in full control of the meeting but apparently no resolutions were passed.

A UNIFORM WAGE SCALE

Advocates of uniformity of wage scales and working hours, such as Dr. D. W. Boone, the Bellaire city health officer, overlook the need which must always exist for diverse wages unless men are to be deported from one state to another where the coal is better or more favorably located. A federal law calling for all fields of wheat to be of equal productivity would be almost as effective.

In fact nothing but a readiness of labor to accept lower wages or to be satisfied with shorter periods of work enable some coal areas to produce. The Ohio miner has been obliged to accept the work available when the price of coal in the market was good. Had he subjected himself to a differential, he could have worked steadily. He is in the unfortunate position of the man who farms a stony or hillside field; he must work harder and receive less or hunt a better field for nature is inexorable and the will of man inadequate to make redress. However, it must be conceded that the Ohio miners are competing with some operating concerns whose scale of wages is too low.

NORTHERN OHIO, CENTRAL ILLINOIS AND INDIANA

A break in the union in the Fifth sub-district which includes Belmont County is expected. It is even said that an ultimatum has been delivered by the men to the union officers that, if in 30 days no settlement is effected, they will sign up individually with the operators and return to work.

The Central Illinois Coal Operators' Association has agreed with the United Workers of America upon a scale in the Springfield district making the machine-mining rate 80 per cent of the pick-mining price.

In Indiana the minority in the union has called for a special convention for July 21. Seventeen locals have sent petitions asking that a special convention be called to consider charges that state union officials have violated the terms of the wages contract in settling grievances and did so in favor of the operators. Specific charges are brought against William Houston, president, and Thomas Moss, member of the executive board.

THE SOUTH-WESTERN COAL FIELDS

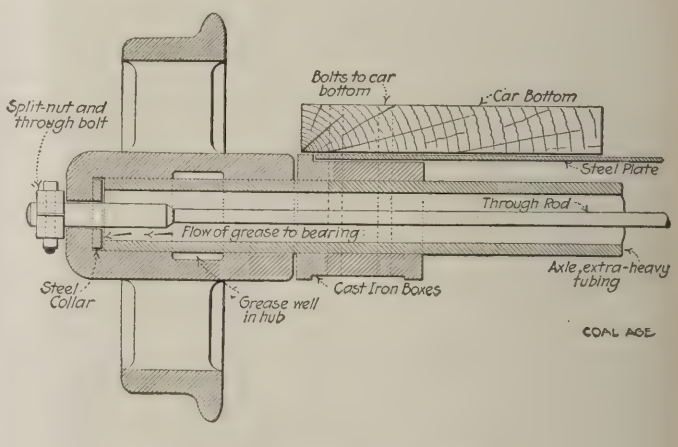
The conference at Kansas City, Mo., still continues. John P. White regards the situation in this section as so serious that he is giving it his personal attention. He is, moreover, in an excellent location to keep an eye on the Western situation.

The trial of P. R. Stewart, president of the Arkansas district of the U. M. W. of A., and others charged with violating an injunction by interfering with the operation of the Mammoth Vein Coal Co.'s plant, began at Forth Smith, Ark., on July 2. The conditions leading up to this trial were described in our issue of July 4. Joseph Hayden, a hardware dealer of McAlester, Okla., testified that Fred W. Holt, secretary of that district, bought from him between 20 and 25 rifles and 100 rounds of ammunition for each, to be sent to the strike fields.

NO CHANGE IN COLORADO

In Colorado, we hear that J. C. Osgood, president of the Victor-American Fuel Co.; J. F. Welborn, president of the Colorado Fuel & Iron Co., and C. W. Brown, president of the Rocky Mountain Fuel Co., conferred with the legislative committee on the miners' strike on June 25. Hywell Davies has been traveling through the strike zone and William R. Fairley has been in conference with the strike leaders. But so far, from what can be learned, no action has been decided on.

ALBERTA STRIKE



Three hundred miners of the Brazeau Collieries Ltd., at Nordegg, Alta., are on strike, demanding a wage increase. In April these men became organized in the United Mine Workers Union, but the officials from Fernie could not get the company to sign an agreement. A verbal contract was made by which the scale then in force would continue until June 15, and promising that a new schedule suitable to both parties would be drafted by that date. Apparently the men sought to assure themselves of a satisfactory scale by striking in the closing weeks of June.

WALES VERSUS U. M. W. OF A.

On July 1, a jury was completed at Binghampton, N. Y., to try the case of A. D. Wales against the United Mine Workers of America to obtain $200,000 for services in settling the anthracite coal strike in 1902. The evidence of Theodore Roosevelt given in New York City and to which reference was made editorially in our issue of June 6, will be read to the jury.

A New Mine-Car Truck

To meet the growing demand for a running gear that will be reliable, economical to lubricate, and one that will operate with a minimum amount of friction without the use of rollers the truck illustrated herewith was invented and developed by J. F. Fox, of Birmingham, Ala., and manufactured by the Southern Wheel Co.

Cross-Section of Truck

The main feature of the construction is the axle, which is made of extra-heavy steel tubing, and acts as a reservoir for the lubricating grease. This lubricant is fed out of the open end of the axle into the wheel hubs by the side motion of the car and the force of gravity. This method produces practically a bath lubrication.

The wheels are held in running position by means of a round rod, which passes through the axle and the wheels and is secured at the end by means of a split nut and through bolt which clamps the nut on the rod. Since the fastening rod is free to turn with the wheels there will be no friction, and therefore no wear between the wheel hubs and the nuts, except the small amount due to the difference in velocity of the wheels in rounding curves.

This method of fastening is extremely simple as removing one small nut releases the wheels and axle from the car and furnishes a frictionless wheel fastening that cannot be destroyed by wear.

These trucks have been tried out for the past 15 months under the most severe conditions by the largest operators in the Birmingham district, and have fully met the expectations of the designer, and are filling a long-felt want in the mining industry.

Beehive Oven Coke

By a Pennsylvania Superintendent

SYNOPSIS—Coke ovens were first employed in the United States in 1841. Although Connellsville coke is regarded as a standard with which to compare other metallurgical fuels, byproduct ovens, on account of their greater economy, are steadily increasing in numbers.

To those who are not familiar with the usages in vogue when coke was first made in this country, I will outline briefly the original methods employed. Coke was first made in this country in 1817. It was not burned in bee-hive or rectangular ovens but in pits in the ground. The coal was taken from the Pittsburgh or what at this time is better known as the Connellsville seam. Many experiments were made in using this fuel for iron smelting, etc., up to 1825, while the first reliable information we have on coke ovens relates to the year 1841.

The U. S. Geological Survey has published a report showing the progress of the manufacture of coke as follows:

COKE IN THE UNITED STATES

Year	No. of Companies	No. of Ovens Built	No. of Ovens Being Built	Coal Used, Tons	Coke Prod., Tons	Yield
1880	186	12,372	1159	5,237,741	3,338,300	63%
1890	253	37,158	1547	18,005,209	11,508,021	64
1900	396	58,484	5804	32,113,543	20,533,348	63.9
1901	423	63,951	5205	34,207,965	21,795,883	63.7
1902	456	69,069	8758	39,604,007	25,401,730	64.1
1903	500	79,334	6175	39,423,525	25,274,281	64.1
1904	506	83,599	4430	36,531,608	23,661,106	64.8
1905	519	87,564	4751	49,530,677	32,231,129	65.1
1906	532	93,901	4519	55,746,374	36,401,217	65.3
1907	552	99,680	2546	61,946,109	40,779,564	65.8
1908	551	101,218	2241	39,440,837	26,033,518	66.0
1909	579	103,982	2950	59,354,937	39,315,065	66.2
1910	578	104,440	2567	63,088,327	41,708,810	66.1
1911	570	103,879	2254	53,278,248	35,551,489	66.7

IN PENNSYLVANIA IN 1911 THERE WERE

Bee Hive Ovens		Byproduct Ovens		Total Number	
Built	Building	Built	Building	Built	Building
53,612	971	1292	300	54,904	1271

From the above may be seen the steady gain in byproduct ovens.

The chief requisite in coking is to obtain from any given quantity of coal the maximum amount of coke with the least consumption of the fixed carbon of the fuel. A bee-hive oven is a circular vaulted firebrick chamber built on a good foundation of tamped clay. An opening is left in the top whereby the oven is filled. This also allows the gases evolved in coking to escape. An arched door is provided at the bottom through which the coke is drawn.

The Quality of Materials Used Means Much

Care must be taken in the choosing of brick, tile for the bottom, jambs for the doors and arches. As the oven attains a great heat, 2000 to 3500° F., it is necessary to use material which will withstand this high temperature. The filling is an essential part in the construction of ovens. Filling which has lime or iron in its make up should not be used as when the oven attains its greatest heat, these constituents become viscous, run, make holes in the brickwork and cause the ovens to cave in.

To get good coke, ovens must at all times be kept in good condition. Crowns should never be exposed, but should have from 8 in. to 18 in. of good loam filling to take care of winds and rains and hold the heat to insure the quick ignition of the coal, thereby producing at all times the maximum amount of coke from the coal charged. It is better to overcharge an oven than to undercharge it because the maximum heat should be retained as nearly as possible, up to the time when the oven receives its next charge.

In the making of good coke, leveling is one of the most important processes. Either through ignorance or neglect on the part of superintendents, and other officials, this detail is usually left to the levelers, who are not always properly trained to the work, and who, being paid by the piece, naturally desire to level as many ovens in a day as possible.

Improper leveling leaves different heights of charge which coke to the bottom in different periods of time, with the result that the top surface of the coke is exposed to the action of the air admitted for the completion of the process and some coke is burned and lost. On the other hand, the high places will not entirely coke through and leave black butts and part coke or coal on the bottom.

Coke Varies Physically and Chemically

Coke varies in external appearance, physical properties and chemical composition. It may be dull gray, light gray, or light gray and silvery in color. It may be rough, but that part of the charge next to the walls of the oven is often smooth.

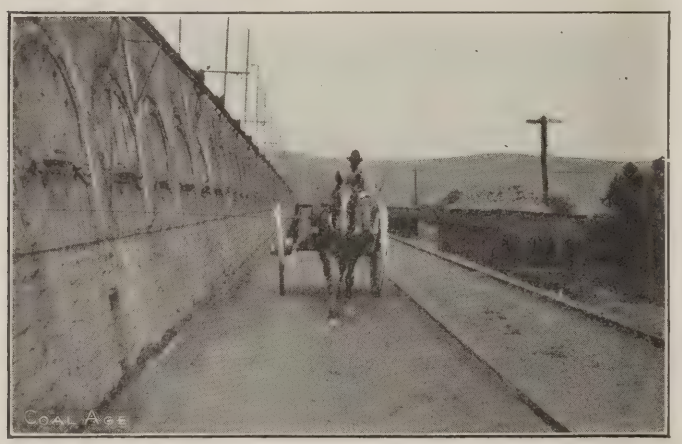
The color of coke is due mostly to the kind of coal it is made from. Coke should only be watered once, both to insure a good appearance, and to keep heat in the ovens. Watering should not be done with part of the door up, as this floods the oven and cools the bottom, thus retarding the catching up of the following charge, not allowing it a sufficient time to burn, thereby either lowering the quality or decreasing the tonnage secured.

All coke is more or less cellular, generally it is permeated by a fine system of inter-communicating pores.

Pennsylvania has from the beginning of coke making in the United States maintained the supremacy in production. The bee-hive oven coke from the Connellsville district is still considered the standard coke.

Some time ago, ovens were not expected to yield over 66 per cent. of the weight of coal charged, but now it is a superintendent's or yard boss' business to get the greatest yield possible. In many cases in the Connellsville field 70 per cent. of coke is taken from the ovens. This is brought about by employing coke burners—men who know just when an oven has reached the state wherein the different changes have taken place and a further continuance of the process would result in waste. The oven is then sealed up and held to this stage until drawn.

The making of coke, while not the most pleasant kind of work, is yet very interesting, for what will apply to one locality will not in many cases hold good in another. The coke maker must determine the condition of the charge from the flame given forth through the tunnel head and be guided accordingly.



The Denbo Mine of the Reliance Coke Co.

SYNOPSIS—A modern plant erected with uptodate rapidity and producing with economy the limited demand of the ovens which it is to supply.

There is an atmosphere of satisfaction about the ordinary coke plant, which compares somewhat strangely with the evidences of strain around the ordinary coal mine, for the most manifest condition at a shipping colliery is the daily striving to beat a previous record. There is no rest; the record once established will have to be broken tomorrow. But in the coke plant, there is a fixed limit. Once it is reached safely, the need for increased output is entirely at an end, and the management has time to approach questions of efficiency and economy.

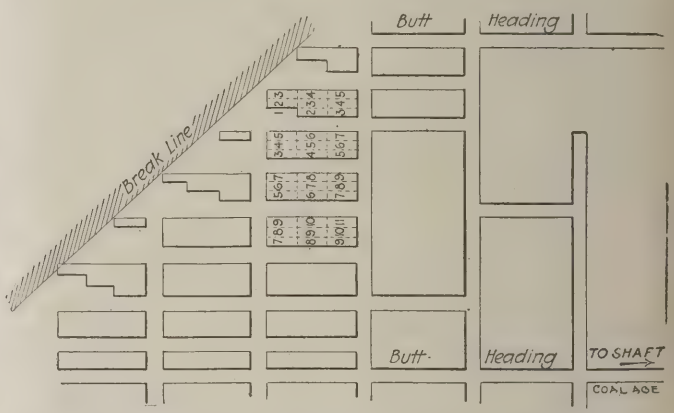
The Coke Ovens

The plant at Denbo has nearly reached its maximum tonnage—just enough to supply with coal the 200 ovens in blast and the 106 houses in the mine village. There

A View of the Coke-Oven Yard, Showing the Projecting Track at the Tops of the Ovens from Which the Doors Are Hung before Being Opened

are 36 ovens not in commission, and when another 64 are built, the plant will increase its output accordingly and mine about 1000 tons per day. But a deep ravine cuts off the ground suited to this extension, and consequently it may be some time before the ovens are built.

The ovens are of the Mitchell type, 30 ft. long, and the doors by which they are closed are illustrated in an article in this issue entitled, "Some Types of Coke-Oven Doors." The ovens are built entirely without any taper from one door to the other, and there is no difficulty in pushing them despite that fact. The coke shrinks sufficiently on cooling so that it does not bind in the oven. The equipment of the ovens does not vary in any way from the ordinary battery of Mitchell ovens with machine operation, except perhaps in the doors, and consequently further description is unnecessary. Each oven is charged three times a week, the furnace-coke charge being about 27 or 28 in. deep and the foundry about 33 inches.



The Shaft and Storage Bins

The mine shaft is 78 ft. deep, so that the coal is at a level with the bed of the Monongahela River. Yet, though the valley is narrow, so that it is hard to find room for town and plant, there is little water in the mine. The headframe is of steel and was erected by the Riter-Conley Mfg. Co. It has self-dumping cages, and the coal falls, on being dumped, into a 200-ton capacity steel bin.

It is then crushed in a crusher, manufactured by the Williams Patent Crusher & Pulverizing Co. This reduces the coal till it will all pass a screen of 2½-in. mesh. The coal is not washed, but goes directly to an 800-ton steel bin, where it is stored and discharged into the electric larries for distribution to the coke ovens. These were supplied by the Connellsville Manufacturing & Mine Supply Co., but are of a special design.

The Power Used Underground

The bed mined is the Pittsburgh, and the coal is from 7½ to 8½ ft. thick. Consequently, a 2-ton car is used. This is made of wood and holds 50 bu. when loaded level full. To make it stiff, it has a strong steel bottom frame.

Proposed Method of Mining at the Denbo Mines. Shortwall Machines Will Be Used. Cuts Will Be Taken in the Order in Which They Are Numbered

At present the gathering is performed by horses, but General Electric locomotives are operated on the main entries. It is the intention eventually to dispense with animal power throughout, substituting electric locomotives in its place.

The current used in the mines is at a pressure of 250 volts, and is generated by two 250-kw. Westinghouse dynamos. This current actuates not only the haulage motors, but the coal crusher, all the oven machinery, three Goodman breast machines, two Sullivan shortwall cutters and the hoisting machine by which material is lowered into the mine. The hoisting of coal is not performed electrically, but by a Vulcan 24x30-in. hoist.

Coke Breeze Furnishes Power

The three 350-hp. Rust boilers are fired with coke breeze, which is hauled from the ovens by horses and carts, and dumped above the boilers. The slope of the hill enables these to be set at a low level, so that the breeze need not be elevated. A little coal is mixed with the fine coke, and the mixture is fed to the boilers by Parsons

stokers. The boilers are capable of 100 per cent. overload. A 150-ft. steel stack, 6 ft. in diameter, supplies the draft. One man tends the boilers and another the generator and hoisting engine. The boiler ashes drop down into bins over a tunnel and are removed by small industrial cars.

The Underground Conditions

The coal is cut on the bottom of the seam and shot down with Miner's Friend "Safety Powder" exclusively. There is a good 30-ft. sandstone roof above the 10-in. draw slate and 10-in. rooster coal. Ventilation is secured by a 14-ft. Jeffrey blower fan having 4-ft. blades. This is capable of supplying 250,000 cu.ft. of air per min. at 6 in. of water gage. Ultimately, the fan will be used as an exhaust. As the mine is damp, the entering air is not moistened with steam.

The second opening is the material slope, the hoist of which was previously mentioned. This is 250 ft. long and concreted at the top, bottom and side. The mouth of this escapeway is shown in the accompanying illustration. The whole shaft bottom is supported by 15-in. I-beams at 6-ft. intervals, resting on other 15-in. I-beams, which are themselves carried by brick pillars which are spaced 12 ft. apart and are 18 in. square. All the

The Concreted Slope Serving as Second Opening, Manway and Material Hoistway with Coke Ovens and Yard in Rear

brattices in the mine are of brick set in cement, and all doors on the airways are of steel.

The track in the bottom is of 65-lb. steel; the haulage roads are laid with 45-lb. steel and the rooms with 20-lb. Wood ties are used throughout the mines. The mine is being worked on the room-and-pillar system, but the plan of shortwall mining, illustrated in the accompanying figure, is proposed and will probably be installed. It is said that in another mine, in a working area 900 ft. long and 900 ft. wide, a tonnage of 1500 tons a day was obtained using this system. The butt headings will be about 300 ft. apart and the room crosscuts will be made about every 35 ft.

The general appearance of the plant is strongly in its favor. The power and repair houses are both of brick and are covered with cement tile. The repair shop measures 40x100 ft. and contains in the blacksmith, carpenter and machine shops, all the tools needed for rapid mine-repair work.

Quick Construction Work

That the mine is quite new and that all due speed was used in opening it, can be judged from the fact that the shaft was not started till October, 1912. The coke ovens were put into operation September of the following year. The headings to be driven before coal could be obtained in operating quantities were quite lengthy, between 3200 and 3800 ft. long. This was because the shaft had to be sunk at the edge of the coal territory. However, this driving was speedily effected, the headings each progressing 65 ft. a week with only two shifts at work. Goodman breast machines were used, which sumped 7 ft., assuring 6 ft. 6 in. of actual progress per cut. No work was done on Sundays.

The town is more than usually pleasant, though the miner's houses are all double. There are six foremen's houses, all piped with hot and cold water and fitted with baths and electric lights. There are 50 five-room and an equal number of four-room houses for miners. Each has an outside closet, with an outlet to a sewer. This is flushed occasionally, the water passing into a large cesspool.

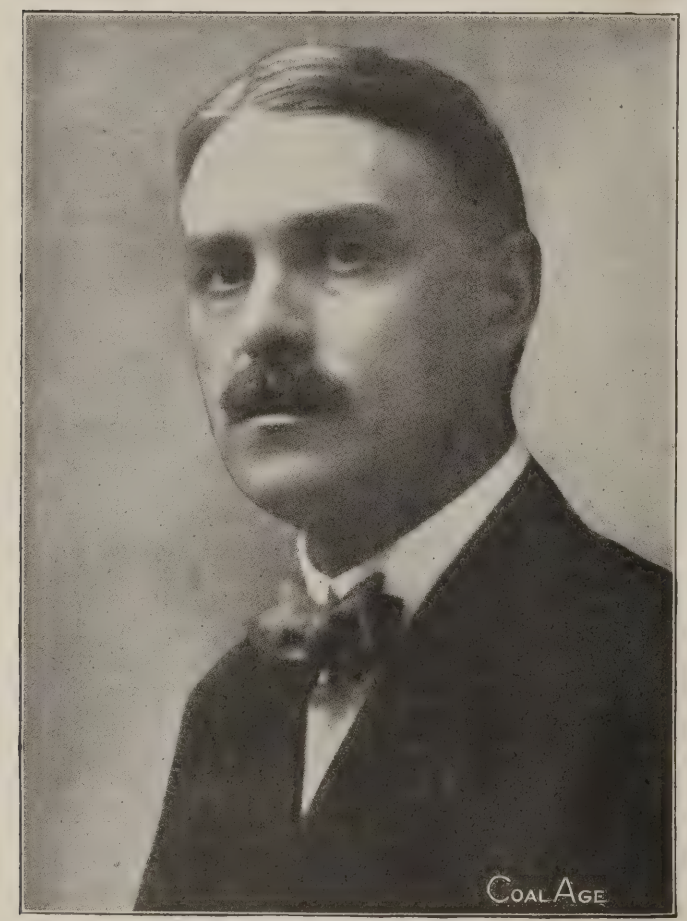
The town is netted with a 4-in. water line, carrying river water and affording fire protection. The supply for drinking is derived from wells bored about every 300 ft. These are cased for about 35 ft. of their depth. The wells are from 50 to 60 ft. deep, excellent water being found in the sandstone above the coal.

No Smoke and Many Healty Trees

The houses are placed up the river, so that the full length of the steam plant and a little park lies between the ovens and the bulk of the town. That little park is itself the best evidence of the truth of the assertion that only about three times in two years has the wind blown up the river and carried the smoke formed at Denbo and at Alicia, which is across the river, toward the mine houses. The little trees are quite fresh and healthy. The town is lighted throughout with 150-watt Mazda lamps. There is a two-story commissary with cemented cellar and a refrigerating plant for cold storage and ice-making.

Fritz Hofwing is manager and mining engineer, and G. C. Landis, of long experience in the coke business, is superintendent.

Pacific Coast Collieries Co.—In connection with a new bond issue this company has made the following statement re its properties: The holdings comprise large coal areas owned, licenses, rights, etc., on the east coast of Vancouver Island, mine plants, railways, employees' houses, docks, surface lands, timber lands, a terminal property of over 100 acres at deep water on Boat Harbor, with bunker (storage capacity, 4000 tons), and washing and sizing plant of an output of 900 tons per day (less than half the output of coal is to be washed). On the South Wellington and the Suquash properties alone there is estimated to be over 200,000,000 tons of coal. The coal in the South Wellington Mines is a high-grade bituminous coal, for both steam and domestic use. The Suquash mine, upon which development work was started only very recently, is situated about 100 miles north from the South Wellington Mines.



With the completion of the 12-mile railroad, and with the equipment now being installed, the company will be able to handle up to 2000 tons per day.

Sinking fund from May 1, 1915, 7c. per ton of 2240 lb. run-of-mine coal, the minimum annual $60,000, to redeem the bonds at not over 105 and interest.

Wellington Mines Nos. 1 and 2 have been in operation for some years, while No. 3 mine is practically now ready for production. Two 650-ft. shafts having been sunk and equipped for an output of 1500 to 2000 tons a day. Exclusive of the Suquash property, the General Manager estimates the production from Wellington Mines Nos. 1, 2 and 3 for the year 1914-15 at 400,000 tons and for 1915-16 at 750,000 tons, on which basis they should show, after allowance for deple-

Who's Who in Coal Mining

The Allegheny River Mining Co., with headquarters at Kittanning, Penn., is one of the live coal corporations of the Keystone State. At the present time the output of this company's mines is about 9000 tons per day. Several new mines are under construction or have been planned. The progressiveness of the Allegheny company is principally due to the determined efforts and shrewdness of its president, Dwight C. Morgan. He is the mainspring of the company's present organization and is regarded generally as a most important factor in Eastern coal-mining circles.

Dwight C. Morgan

Mr. Morgan was born at Dwight, Ill., in 1868. He comes of a line of ancestors of wide reputation in science and engineering. He is descended from Dr. Richard Price, who was famous as an economist. His grandfather was Richard Price Morgan, Sr., a graduate civil engineer, who made the first surveys for the New York Central & Hudson River R.R., and the first surveys for the Chicago & Galena Union R.R., which was the first steam road built out of Chicago. His father, Richard Price Morgan, Jr., also a civil engineer, is generally known as the father of the elevated railroad system of New York City. He was greatly interested in the development of engineering in American universities and was given the degree of Doctor of Engineering by the University of Illinois.

After receiving his early education in the public schools of his native town, Mr. Morgan graduated from the University of Michigan, in 1893. Aside from being president of the Allegheny River Mining Co., he is vice-president and director of the Pittsburgh & Shawmut Railroad Co., president and director of the Allegheny River Realty Co., director of the Armstrong County Trust Co., and president of the Allegheny River Improvement Association for river navigation between Pittsburgh and Oil City.

In his earlier days, Mr. Morgan was engineer in charge of the valuations of the railroads of Minnesota and at one time was commissioner of the United States Supreme Court to settle the boundary-line dispute between Iowa and Missouri.

He is a member of the Western Society of Engineers, Duquesne Club, Railway Signal Association and Pittsburgh Traffic Club, and has lectured on engineering topics at the Universities of Illinois and Minnesota.

Fire at Cinderella, W. Va.

A fire occurred recently at the mines of the Sycamore Coal Co., at Cinderella, W. Va., and five men who were in the mine at the time were suffocated. It is said that more would have been in the mine and would have succumbed to a like fate had they not stayed on the surface to celebrate appropriately the first day on which West Virginia "became dry." The fire broke out late in the evening of June 30.

Cinderella is a new plant, built by G. S. and S. W. Patterson, of Vivian, W. Va., the proprietors of the ill-fated Bottom Creek mine. It is located east about 4 miles from Williamson, in Mingo County. The company is mining two seams of coal, the Coalburg and Winifrede, roughly 60 ft. apart, both ventilated by the same fan. Fire, probably originating from crossed electric wires, started in the fan house, destroying that structure. Apparently the fan continued to run and forced the fumes down into the mine, where the men were at work.

The fire in the Coalburg or upper seam was so severe that it destroyed a brattice 40 ft. from the drift mouth, where the first left entry led off. All the men were in this left entry and it was impossible for the rescuers to enter it. As the main entry passes through the mountain, the rescuers were able to reach the fire from the front and behind. In a short time, however, both coal seams were on fire, but with a hand pump the blaze was soon extinguished in the Winifrede seam.

A large pump was brought from Vivian to play on the fire, pipe having been laid for that purpose before the pump arrived. It was thought futile to reach the men through the burning entry, and so Engineer Maurice made a survey in the underbrush before daylight, using carbide lamps, to discover which was the most feasible place for an opening from the surface through which to reach the men. The entry was struck about 2 p.m. on July 1.

The rescuers had no trouble entering as the air was good. A suction fan had been placed in the drift mouth early in the morning to draw out the bad air and lower the temperature and it is thought that had the men retreated to the rear end of the workings and barricaded themselves in, they might have been saved.

According to the U. S. Geological Survey, West Virginia miners work an average of 266 days each year. The only other states that work more days than West Virginia are Utah, where the average is 285 days, and New Mexico, where the average is 284 days per year.

Editorials

Some Psychology

President Wilson recently said that our present financial condition was due to psychological causes and some barren wits have changed his statement and now make him allege that general stagnation of business was psychological and not real. This is untrue; causes may be mental, that is psychologic; conditions never are. In fact, nearly all our present well-being as compared with the ill-being of savages is psychologic.

For the material for well-being was just as much present two thousand years ago as today, but men did not have the present viewpoint which has changed the face of the earth. The change is psychological in its origin though material in its result. We have permitted and shall permit ourselves to use the scholiast's word "psychologic," but perhaps the word "mental" is a better and a less pedantic expression, because the viewpoint is mind itself and would not be changed even if there were no psychology, which is merely the science of the mind.

We have spoken of business, but it is not of the present depression in trade of which we are thinking. We are not going to show that our disease of mind has been the only cause of the decline of business. We are not about to demonstrate that imports have increased only slightly and that we have as much export trade as ever and that England and Germany have also a period of trade doldrums in place of trade winds. Rather, we are proposing to apply psychological truths, that is, facts relating to the mind, to the prosaic questions of coal-land values.

Certain worthy contributors and some enlightened national coal-land officials and a few of our leading experts have tried to base the values of coal lands on the laws of mathematics. As a matter of fact, when a man would buy a piece of land, he asks himself how much he has to spend and whether it will buy him what he seeks to purchase. Very rarely will he say, "A portion of what I desire to purchase sells for so much. If I am going to buy so many portions in so many years at so much per portion, what would be its equivalent now?" And thus it is that first cost of coal land is not based on probable royalties and in fact is usually far less than the present value of current royalty rates.

In fact, it is the allurement of small present expenditures which makes the well-to-do so willing to pay dime and quarter tips, the poor man so ready to buy a bucket of coal at $20-per-ton rates, and the London east-ender so indifferent to the cost of tea so long as he can buy a farthing's worth for his supper.

This readiness to pay in small installments and pay outrageous prices is the reason why pianos sell so readily much above their value and why also coal lands purchasable at $20 per acre have been known to draw the self-same year 10c. per ton royalty with a minimum output placed at 200,000 tons per annum.

And moreover, the rate of interest on which the present-day value is usually figured is so low that the average business man is not well pleased to accept it as a basis for his calculation. It is true in some cases that the coal man has his money in his business year after year without profit and in some years seems to be exchanging his good United States dollars for those of Mexican coinage, yet in his mind, when he buys, he is figuring on 10 or 20 per cent. interest on his money or he will turn the project coldly down. In fact, he will tell you that anyone who figures on 10 per cent. may earn perhaps 5, but if he estimates on 5 per cent., he may find himself without any profit whatever.

The whole basis of figuring from royalty values is wrong until you arrive at the condition when some rich estate of absolutely unquestioned value, having been acquired at a low figure, is held by some heirs of a speculator who are satisfied to get a steady income from the lands. Then, perhaps, it will be found that the royalty rate bears a favorable relation to the present-day selling cost, because the parties are not disposed to sell and regarding the coal as an investment, figure the interest at the rate bonds would bring.

But what the relation actually is between selling price and royalty is not a mathematical but a mental factor and depends not on the laws of interest, but on the personal equation which, to solve, demands a knowledge of human nature rather than of logarithms.

We are not opposed to mathematical calculations. They are excellent things, if people will make them; so are eugenic marriages. But as a matter of fact, few take such careful count, and purchase, like matrimony, has some of the elements of a lottery. If scientists must figure, why not estimate royalty from present value and not *vice-versa?*

When the Miners Celebrate

The celebration of our national holiday presented an opportunity for observing sociological conditions in the mining regions that seldom occurs. With the American warships maneuvering in Mexican waters and the stars and stripes floating over Vera Cruz, perhaps the event this year carried a particular significance. Certainly the true, full-blooded American entered more heartily into the spirit of the occasion and thought more seriously of patriotism and all the latent possibilities connected therewith at the present time.

But disregarding these aspects of the celebration, a study of the rank and file of the mining communities in their gala dress presents interesting food for thought. Especially is this so to the uninitiated public at large to whom the expression "mining camp" usually conveys the impression of a single straggling road, lined with dilapidated shacks, inhabited by a gun-fighting population.

On the contrary there were probably few sections of the country where the day was recognized with a greater patriotism and less disorder than in the coal-mining communities. And the casual observer at a mining village

could not fail to be impressed with the high general average of the men participating in the parades. It is true that the large majority carried the unmistakable stamp of foreign origin, ranging from the swarthy Italian to the fair-haired Pole. But it is equally true that some of these nationalities almost eclipsed the native Americans in their enthusiasm over the occasion.

For example one of the most impressive sections of the Summit Hill (Carbon County, Pennsylvania) celebration was a Slavish company caparisoned with scintillating helmets and brilliant uniforms that evoked spontaneous applause from the assembled throngs. In the ultimate analysis, it is upon these men that we must depend for the brawn and sinews to keep the wheels of our industries moving, and this hearty support and hopeful intent are most gratifying to observe.

A salient feature of the celebrations generally was the note of good living and general prosperity that pervades the districts. The paraders as a whole were a sturdy class, clear-eyed, generally quick witted and with an elastic step that comes only with clean, healthful living. Among the younger generation evidence of a moderate affluence was observed in the cut of their clothes, which was supplemented with a modest finery. Indeed in a "mining camp," the Fourth of July throws a new and interesting side light on the coal industry.

Selection of Mine Foremen

The members of the executive boards of the first, seventh and ninth districts of the United Mine Workers of America met in executive session on June 5 and passed a resolution against the certificating of men as mine foremen or assistants unless they have had experience as practical miners. It is not sufficient, in their belief, that they shall have worked in the mines the statutory period, but that they shall have dislodged and loaded coal for that period of time.

We can hardly blame the workingman for that stand For hundreds of years the educated classes have kept up their aristocratic domination by urging that only those who had spent so many years in college were fit or could be fit for employment in certain preferential occupations and offices. There was enough logic in the stand to make it appear plausible and men who had brains and education but not the mere residence in college were effectually excluded, and men who had neither brains nor real education but the required amount of residence received the emoluments and controlled the offices.

Which was all wrong, and so is the restriction of mine foremanship to miners. A fit man should not be excluded if he has the qualifications. A knowledge of mining is not only to be gotten at the end of the pick or the handle of the drill, though many a good thinker is loading coal. In fact, this desired restriction is class legislation in another shape.

Our consideration of the matter thus far has been based on the idea that the miner desires this restriction because he wants to reserve all the official jobs around the mines for himself, but as large an element we readily concede is the desire to have in authority men who are expected to be competent and considerate instead of men whose experience is different and whose sympathies are not with the men they control.

As far as competency is concerned, the mining operation will, from year to year, become more and more the work of machines, and increasingly will it be important for the men in authority to understand them. Nor do we believe that competency consists alone in knowing how things have been done in the past. The really competent man is the man who discovers a new way, and such men are quite frequently those whose line of work or even of life has been a trifle different to that pursued in the occupation of which they eventually come into control.

For instance, the complete stranger in pitching mines wonders at the loose way in which steep slopes are unguarded. He wonders if it is necessary to omit hand rails and ladderways in steep pitching breasts. The miner scoffs at these dangers and he knows they must continually be faced under normal conditions at the breast, and he has grown so calloused to them that he does not seek their removal where a remedy is simple and inexpensive. Now, while the mine foreman should certainly never be so ingenuous as a complete stranger, we believe that there are men who have worked five years around the mines who will see errors in mining methods that the miner will never see.

As to the matter of sympathy and solidarity, we think also that permitting other workingmen in the mines than miners to qualify for foreman is to be commended. There is no one so much in sympathy with the miner as the man who has never entered a mine. Those who have worked in them but have not done the laborious work are more prone to be thoughtful of the miner's difficulties and dangers than a miner himself.

Who is worse to work for than a man who, being told that there are six inches of water over the rail in a gangway which should be removed, responds with an oath that it was always that way in some place or other in the mines when he was digging coal. There are many workingmen in authority who can never forget how soon they went to work, how low some of the coal was, how long they waited for cars, how much water they had to wade, how murky was the air and how dangerous the place, and they take a sort of unholy delight in perpetuating the past and in pleading that such inconveniences and dangers are and ever must be a part of the business Whereas, put a man with a somewhat different line of experience in charge and all these things seem unnecessary.

In fact, it has been a surprise, and not altogether a pleasure, to see how the miner who has gotten into office as foreman or inspector will often be more considerate of corporation purses than the operator himself would be if he were put in the same place. "What has once been endured, can be endured again," is the complacent motto of many of such one-time miners.

Do not misunderstand our position in this matter. Mine foremen, of course, should have had much experience in the mine, but it is not by any means certain that the miner will be best cared for if all appointments are made from those of his own vocation.

It is estimated that the provision of electric cap lamps for the miners of the Pittsburgh district will cost the coal-producing companies $2,500,000. Alterations to the coal tipples of Ohio to enable the operators of that state to conform to the new anti-screen law will necessitate an outlay of $2,000,000. These two instances illustrate the enormous expense which is incurred by the industry in making the comparatively trivial changes which working conditions, agreements, or statutes render necessary.

Legal Department

When Is Coal Delivered to Buyer?

By A. L. H. Street*

SYNOPSIS—The New York Supreme Court, Mr. Justice Kruse dissenting, decides that the seller, and not the buyer, of coal must bear the loss which accidentally occurred while it was awaiting unloading.

The question whether the buyer or the seller of two boatloads of coal should bear loss arising while the boats were waiting to be unloaded, was involved in the case of Westmoreland Coal Co. vs. Syracuse Lighting Co., 145 *New York Supplement,* 420, which was recently before the Appellate Division of the New York Supreme Court, fourth department. It was decided that there had been no such delivery of the coal as to pass title to the buyer, and that, therefore, the loss fell on the seller.

Plaintiff sold defendant 50,000 tons of coal to be delivered "alongside" defendant's dock at Syracuse. The two boatloads involved in this suit approached to within 300 or 400 ft. of defendant's dock, which is on a canal, but they could not be docked and unloaded because two other boats then occupied the dock. Accordingly, to comply with rules governing traffic on the canal, the boats in question were moved by the carrier to the side of the canal opposite the dock to await their turn for unloading. Defendant was notified of the arrival of the boats, and entered them on its books as having arrived at the dock. Two hours later, a break occurred in the canal, and without any fault on the part of the plaintiff the boats and their cargoes were drawn into the break and lost. On these facts the Supreme Court held:

The Carrier as the Seller's Agent

"If the coal in question had not been in fact delivered to the defendant before it was lost, then the carrier still remained the agent of plaintiff for the purpose of making delivery of it under the contract. It is clear that the carrier's duty in making the delivery had not at that time ended. He still had to place the boats alongside defendant's dock. This he had not in fact done, though the boats at one time had approached within a few hundred feet of the dock. . . . Defendant was not responsible for this delay in laying the boats alongside the dock. . . . Plaintiff was fully advised before the contract was made that the capacity of the dock was limited, so that only two boats could be unloaded there at the same time." The court concludes that the carrier, in taking the boats to the side of the canal opposite the dock, was acting as the seller's, and not the buyer's, agent.

Entry of Arrival No Acceptance

According to the decision, the fact that defendant entered on its books the arrival of the boats does not show an acceptance of the coal by defendant; the entry being merely a concession to plaintiff's interest for the sole purpose of fixing a time from which subsequent possible claims of boat captains against plaintiff for demurrage could be corrected and verified.

Answering a contention made by plaintiff that when it placed the coal on the boats there was an appropriation of it in fulfillment *pro tanto* of the executory contract for delivery of coal, the court said:

"While this may have been an actual appropriation by plaintiff to that end, yet it did not complete what it had agreed to do before title passed to the defendant. . . . Delivery of the coal at the place specified in the contract was required to be made, and then only would the defendant's assent to such appropriation in part fulfillment of the contract be established."

Mr. Justice Kruse, presiding judge of the court, refused to concur with the holding reached by a majority of the justices constituting the court, and adhered to an opinion that title had passed to the buyer and that the loss must fall upon it. Judge Kruse said in part: "If there was an appropriation of the specific coal to the contract, assented to by the defendant after the coal reached Syracuse, as I think should be found as a fact from the evidence, the title passed to the defendant, and the loss must fall upon it. . . . Not only did the defendant know the precise time and place of arrival of the coal, but a record of the quantity, as well, was made by it."

*Attorney-at-law, 317 Commercial Bldg., St. Paul, Minn.

Recent Judicial Decisions

Injury to Miners in Washington Mines—A Washington mine operator is not liable for injury to a miner caused by failure of a fireboss to make tests for gas before firing shots; the boss being regarded as a fellow servant of the injured miner and not a representative of the operator. (United States Circuit Court of Appeals, Ninth Circuit; Pacific Coast Coal Co. vs. Brown; 211 Federal Reporter 869.)

Dangers Against Which Employer Need Not Warn—Although a mine operator owes a duty to his inexperienced employees to warn them against dangers of their work which are unknown to them, there is no obligation to warn against an obvious danger involved in the very nature of the work, as where employees are engaged in timbering a mine. (Illinois Supreme Court, Kalinski vs. Williamson County Coal Co., 104 Northeastern Reporter 1096.)

Consignee's Duty to Unload Shipment—When a car containing a single shipment of bulky freight is placed in a proper place for unloading there is a constructive delivery of the freight to the consignee, especially where the shipment is an interstate one and the railway company has filed with the Interstate Commerce Commission schedules containing a provision that the consignee shall do the unloading. (New York Court of Appeals, Lewis vs. New York, Ontario & Western Railway Company, 104 Northeastern Reporter 994.)

Removal of Coal Near Boundary Line—In view of the West Virginia Statute which prohibits removal of coal within 5 ft. of the line of an adjoining owner's land, a deed to coal underlying a tract described by metes and bounds, giving the purchaser "all the usual mining privileges for the removal of same and every part thereof" from the land, cannot be regarded as authorizing the purchaser to mine within 5 ft. of land retained by the seller. Each separate encroachment subjects the offender to a separate penalty under the law mentioned, and a coal company is liable for its employees' acts whether the officers of the company knew thereof or not. (West Virginia Supreme Court of Appeals, Darby vs. Davis Coal & Coke Co., 81 "Southeastern Reporter," 1124.

Discussion By Readers

How to Buy Coal

[In presenting the interesting inquiry of J. A. Flood, secretary of the Venango Manufacturing Co., Franklin, Penn., p. 39 of the last issue, we offered a few brief comments bearing, in a general way, on the selection of fuel for economic consumption, in the production of power. The remarks were not intended as an answer to the question asked, but to stimulate its discussion. We are glad to be able to publish the following able reply from an authority on the purchase of coal.—ED.]

Referring to the letter of the Venango Mfg. Co., COAL AGE, July 4, p. 39, concerning the price and value of coal based on analyses, permit me to say, in the first place, comments should be made upon the details of this letter and then approximate values can be given.

First. Regarding the analysis and price, given in the first paragraph, for coal to be delivered at $2.05 per ton. From our experience, this would seem an example of a far too common practice of certain coal producers, to take any form of analysis that may come to their hand and use it as representative of their coal. The analysis here shown represents one of the best grades of a highly volatile coking coal and one that would carry with it a quick-sale price, of at least $1.60 per ton, f.o.b. mines, which with a standard freight rate of $1.55, would make the coal, delivered, worth $3.15 per ton.

Second. This coal, used for steam purposes, is a very expensive type of coal. Being a gas coal, high in volatile matter, it would take its place, in sale, with a higher priced gas coal; and, because of its high volatile matter, would be an uneconomical steam producer.

Third. The two analyses made of coal delivered, represent two entirely different coals. Neither one is of the type quoted upon, as shown by the first analysis. It is unnecessary to comment here, in detail, upon these two analyses of deliveries; their value will be shown later. Because of a few minor troubles, such as low evaporation, plenty of shoveling of coal, loss of grate bars, etc., these deliveries would probably cause the loss of all the help in the boiler room, especially in the case of the Car No. 72,494. It would have been economy to have paid for the coal and dumped it in the nearest river.

Fourth. The analysis, given of the Pittsburgh-district coal, costing $2.40 per net ton, delivered, represents, in a way, this type of coal, which also is a highly volatile coking coal. It is not possible to use this analysis in comparison with the other, for the reason that the B.t.u. value of 13,480 is altogether out of proportion for this type of coal, in comparison with the remainder of the analysis. There must be an error in the analysis, or a weathered or extraordinary sample was taken to obtain such results. A normal heat value for such a coal, upon the basis of 1.70 per cent. moisture, would be about 14,150 B.t.u.

Fifth. Now, as to the commercial values of the deliveries of the two cars of coal mentioned, as compared with the quotation of $2.05 per net ton upon the first analysis, comparison may be made in many different ways. We choose, in this case, to compare values by an average of the usual amount of debit and credit, as applied to coal deliveries by corporations buying on specifications. We will use, in this regard, a basis of 2c. deduction per unit (1 per cent.) of ash; 2c. deduction per unit of B.t.u. (100 B.t.u.); and 2c. per unit (½ per cent.) of sulphur. Upon this basis, the value of the delivery representing car No. 62,462, as compared with a price of $2.05 per net ton upon the submitted analysis, will show a value of $1.66 per ton for this coal delivery, with these debits applied. In the case of car No. 72,494, in the same way, the value will be $1.01 per ton. This will show the comparative values of the two deliveries.

Sixth. In order to arrive at another comparison of the relative values of these coals from their analyses, we may reduce them all to a uniform basis of "dry B.t.u." For example:

Analysis No. 1, 14,510 B.t.u. reduced to dry basis, is 14,605 B.t.u.

Analysis No. 2, 13,347 B.t.u. reduced to dry basis, is 13,510 B.t.u.

Analysis No. 3, 11,760 B.t.u. reduced to dry basis, is 11,866 B.t.u.

Analysis No. 4 (corrected), 14,150 B.t.u. reduced to dry basis, is 14,400 B.t.u.

A 100-hp. boiler evaporates in one year (300 days) approximately 9,000,000 lb. of water (30,000 lb. per day). If, from the above dry B.t.u. values, we calculate the evaporation, by dividing the dry B.t.u. by 965 and taking 70 per cent. of such value, as representing the comparative value between the theoretical and practical evaporation factors, or the actual pounds of water evaporated by one pound of coal, assuming a 100-hp. boiler, we find as follows for the amount of each coal that would be used in a year:

Analysis No. 1, 14,605 B.t.u. gives an evaporation factor of 10.60 lb., which shows a requirement of 425 tons of coal for the year, at a price of $2.05 per ton, with a net cost of $871.25.

Analysis No. 2, 13,510 B.t.u. gives evaporation of 9.8 lb., which shows a requirement of 454 tons of coal for the year, at a price of $2.05 per ton, with a net cost of $930.70.

Analysis No. 3, 11,866 B.t.u. gives evaporation of 8.50 lb., which shows a requirement of 529 tons of coal for the year, at a price of $2.05 per ton, with a net cost of $1058.82.

Analysis No. 4, 14,400 B.t.u. gives evaporation of 10.44 lb., which shows a requirement of 431 tons of coal for the year, at a price of $2.40 per ton, with a net cost of $1034.40.

The above comparative figures do not include the relative difference of cost of removal of ashes (local cost reckoned at 20c. per ton) and the effect of lost grate bars, a considerable factor in the case of coal No. 3, Car No. 72,494.

F. P. HARRIS, The Harris Laboratory.

New York City.

The "Safety-First" Call

Letter No. 3—In view of the fact that the larger proportion of our mining population is composed of Latin Europeans, fresh from the feudal agricultural districts of southern Europe, and totally unacquainted with the hazardous nature of the industry in which they engage, the question of properly safeguarding this class has been, is and will continue to be one of serious consideration and vital importance to the people of this country, in both its humanitarian and sociological aspects.

In the solution of this problem, in many cases, the physical man alone is generally considered. While the preservation of life is absolutely necessary, it frequently happens that the misapplication of principles and the injudicious adoption of unsuitable means to this end, make practically impossible the accomplishment of the desired result. No individual can attain to the full dignity of the higher physical, mental and moral development while he is surrounded by conditions that render impossible the full and free exercise of his faculties.

In striving to educate the class of labor that is coming in such large numbers to this country, regard must be had to the conditions that surrounded them at home. The majority of these people are the product of centuries of mental and moral misrule. Their mode of life has been regulated very largely by the law of class distinctions; their mental attainments are proscribed by ignorance and superstition. Their knowledge of civil and moral law is confined to the breach, rather than to the observance of the law. A violation of law is to them *justifiable,* while being caught in the act is *criminal.* In a sense, they are automatons.

Such, in brief, is the raw material that the American mine official must convert into a finished workman. Additional safeguards will not accomplish this end, but will rather perpetuate the ignorance and superstition of their darkened minds. The first requisite to regenerate such a class and give to such men an impetus toward self-improvement is to cause them to feel their individual responsibility for their own safety and that of their fellows. Self-preservation, which is the first law of nature, is supposed to be intuitive; but its recognition as a law, by the individual, involves a sense of responsibility.

And, here, it will be well to recognize a broad principle that any form of safeguarding that goes further than to impart the necessary instruction and to enforce the observance of the mining law and mine regulations by every worker, operates to curtail the sense of individual responsibility and retards the accomplishment of the desired end.

Following this line of action, the foreign workman should be given all possible instructions how to perform his work with safety to himself and others. He should be made fully acquainted with the mining law and mine regulations, and made to understand the danger of violating the same. A strict surveillance should then be kept of the workers, in order to maintain the firmest discipline throughout the mine.

In closing, permit me to emphasize my belief that it is the failure to recognize the absolute need for individual responsibility that suggests a necessity for additional safeguards, which, with proper discipline, should not be required. Perhaps, the chief characteristic of the average foreign worker is a bland, simple and childlike dependence that veils a stategic cunning that is inbred in their nature. This foreign trait too often imposes upon the credulous American mine official, who fails to deal out justice to the foreigner for a violation of law, in the same measure that he would to another worker. Greater safety would prevail in every mine if this feature were more broadly recognized.

T. C. Parfitt.

Jerome, Penn.

Working Coal Seam with Heavy Parting

Letter No. 3—The inquiry on p. 981, June 13, asking if it would be practicable or profitable to work a 5-ft. seam of coal, having a parting in the middle of the seam varying from 6 to 18 in. in thickness, calls to mind an experience I had in working a similar seam in South Wales, some years ago. Although the conditions, in that case, were not as favorable as those described in this inquiry, we were able to work the seam at a profit. In our case there were 18 in. of bottom coal and 2 ft. of top coal, separated by 26 in. of a stone parting. The longwall method was employed in working this seam.

At first, the bottom coal was worked out and the stone spragged. Then, the stone was taken down and after cleaning up the refuse the top bench of coal was dropped. This method proved dangerous, however, many accidents resulting from the fall of stone and coal while mining the lower bench of the seam. On this account, a change was made and the top bench of coal mined first, the stone being then taken out and the bottom bench mined last. The top bench of coal was thus kept about 3 ft. in advance of the bottom coal. This was a great improvement and I do not remember that any accidents occurred after making the change. I believe the same method could be employed in the present case.

My reasons for advising the adoption of the longwall method of mining is that a larger output of coal is produced and the ventilation is kept up to the face, whereby the sanitary condition of the mine is greatly improved. An important feature favoring the use of the longwall method is the fact that no explosives are required for blasting the coal and the latter is obtained in better condition, less fine coal and slack being produced. The mining can be done either by pick or machine, in the parting just below the top bench of coal. The weight of the roof will break the top coal, and this is taken out first. The tendency of the bottom to heave may be sufficient to loosen the remaining portion of the stone; but, if not, a light shot can be placed in the stone above the bottom bench of coal. After the stone is removed and the refuse cleaned up, the lower bench of coal is lifted.

In opening a mine in such a seam as is described in this inquiry, I would adopt the room-and-entry system at first, until I had secured the first weighting of the roof; then I would cut across the pillars at the face and lay a face track, 300 ft. in length, between roadways. I believe this method would prove the most economical one to adopt, as it would eliminate the question of yardage in driving the entries and produce the largest output of coal, at a minimum of cost for haulage and material.

W. James, Mine Foreman.

Mystic, Iowa.

A Longwall Proposition

Letter No. 5—In reply to the inquiry of Mr. Hartsuff, COAL AGE, June 6, p. 944, permit me to say that I consider the conditions he describes as ideal conditions for the adoption of the longwall method of mining. Many years of experience and observation in this class of work leads me to favor its adoption under conditions similar to these.

I recall an instance of a mine having a very hard roof and worked on the *room-and-pillar* system. Great difficulty was encountered by the heaving of the floor. Very often during the working hours, the floor would heave to such an extent on the main-haulage road, that the cars would catch the roof and the haulage of coal had to cease until the trouble could be remedied by lifting bottom. As this happened frequently, it can be well imagined what an item of expense this proved.

The same mine was eventually operated on the *longwall* system with great success. It was found, in this system, that the roof settled firmly on the gobs and packs, so that roof and floor practically came together. I feel certain that the same good results would be obtained in Mr. Hartsuff's case, especially as he states that the bottom heaves slowly in narrow work.

In this connection, allow me to refer to my article on Starting Longwall in Room-and-Pillar Work, COAL AGE, Apr. 25, p. 697, which gives information on the building of packwalls in longwall mining. The cost of shooting down the roof and building the packs should be about $1 per ft. of thickness, per lineal yard. The cost may slightly exceed this when back ripping must be done to keep the roads open, as it will then cost a little more to haul the dirt away and pack it in the gob.

The method of working any seam naturally depends on the local conditions in the mine. Speaking generally, however, the system of mining adopted will be determined largely by the thickness of the coal and nature of the roof, floor and coal. Seams not exceeding 4 ft. in thickness are the best adapted for longwall work because it is possible to build good, solid packs to this height. Longwall work in thicker seams is generally more dangerous because of frequent fall of roof and sides, owing to the insecurity of the packwalls and the lack of a proper amount of stowage. The expense for timber is also greater in thick seams.

To obtain the greatest advantage in longwall work, there must be: A fairly good yielding roof; a moderate thickness of seam; little or no inclination; a coal of moderate hardness; and freedom from slips and other faults and water in the strata.

HARRY MARSON.

Piney Fork, Ohio.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Unequal Splits—To illustrate the formulas used in the calculation of the natural division of an air current between two or more airways and the pressure and power on the air, assume a current of 75,000 cu.ft. per min. is passing in the following three splits, starting from the same point of the main airway or at or near the intake opening. The lengths given for the several splits include the return, in each case; and the pressure and power are for the circulation in the splits only.

Split A, 6 × 10 *ft.*, 2000 *ft. long*; $a = 60$ *sq.ft.*; $o = 32$ *ft.*; $l = 2000$ *ft.*
Split B, 6 × 8 *ft.*, 1500 *ft. long*; $a = 48$ *sq.ft.*; $o = 28$ *ft.*; $l = 1500$ *ft.*
Split C, 4 × 12 *ft.*, 2500 *ft. long*; $a = 48$ *sq.ft.*; $o = 32$ *ft.*; $l = 2500$ *ft.*

The lowest relative values are as follows: Areas, 5, 4, 4; perimeters, 8, 7, 8; lengths, 4, 3, 5.

Relative split pressure potentials, $X_p = a\sqrt{\frac{a}{lo}}$; $X_{pa} = 5\sqrt{\frac{5}{4 \times 8}} = 5\sqrt{0.1562} = 1.976$

$X_{pb} = 4\sqrt{\frac{4}{3 \times 7}} = 4\sqrt{0.1905} = 1.746$

$X_{pc} = 4\sqrt{\frac{4}{5 \times 8}} = 4\sqrt{0.1000} = 1.265$

Sum of potentials, ΣX_p 4.987

Natural division of air current, $q_a = \frac{X_a}{\Sigma X_p} Q$; $q_a = \frac{1.976}{4.987} \times 75{,}000 = 29{,}720$ *cu.ft.*

$q_b = \frac{1.746}{4.987} \times 75{,}000 = 26{,}260$ *cu.ft.*

$q_c = \frac{1.265}{4.987} \times 75{,}000 = 19{,}020$ *cu.ft.*

Total circulation, Q ..... 75,000 *cu.ft.*

To calculate the pressure and power of the circulation, it is necessary to employ the part-potential values, instead of the relative values; thus,

Part potential values, $X_p = a\sqrt{\frac{a}{lo}}$ $X_{pa} = 60\sqrt{\frac{60}{2000 \times 32}} = 1.837$

$X_{pb} = 48\sqrt{\frac{48}{1500 \times 28}} = 1.623$

$X_{pc} = 48\sqrt{\frac{48}{2500 \times 32}} = 1.176$

General part potential for splits, ΣX_{po} 4.636

Pressure, $p = \frac{kQ^2}{(\Sigma X_p)^2} = k\left(\frac{Q}{\Sigma X_p}\right)^2$ $p = 0.00000002\left(\frac{75{,}000}{4.636}\right)^2$

$= 5.2$ *lb. per sq.ft.* (1 *in. w.g.*)

Horsepower on the air, $H = \frac{kQ^3}{33{,}000\ (\Sigma X_p)^2}$ $H = \frac{0.00000002 \times 75{,}000^3}{33{,}000 \times 4.636^2}$

$= 11.9$ *hp.*

The Coal Age Pocket Book

Secondary Splits—Primary splits are best indicated by the large letters, as Splits A, B, C, etc. Secondary splits are named after the primaries in which they occur; thus A_1, A_2, etc., or B_1, B_2, etc.

The corresponding split potentials are indicated thus:

Primary potentials, X_a, X_b, X_c, etc.
Secondary potentials, X_{a1}, X_{a2}; X_{b1} X_{b2},; X_{c1} X_{c2}; etc.
General split potentials, X_{ao}, X_{bo}, X_{co}
General mine potentials, X_o

To illustrate the calculation of the effect of making a secondary split in the above mine, assume the air is again split in C, at a point 500 ft. inby from the main or primary split.

Splits A and B are the same as before, while Split C is now 500 ft. long; Split C_1, 1200 ft. long; and Split C_2, 800 ft. long. The part potential values for the splits are, then,

Split A, $X_p = a\sqrt{\frac{a}{lo}}$ X_a (*as before*) = 1.837

Split B, X_b (*as before*) = 1.623

Split C, $X_c = 48\sqrt{\frac{48}{500 \times 32}} = 2.629$

Split C_1, $X_{c1} = 48\sqrt{\frac{48}{1200 \times 32}} = 1.697$

Split C_2, $X_{c2} = 48\sqrt{\frac{48}{800 \times 32}} = 2.078$

General split potential, $\Sigma X_c = 1.697 + 2.078 = 3.775$

Combining this general potential for Splits C_1 and C_2, with the potential for Split C, in tandem, we have,

Part potential values, (*Tandem circulation*) $\frac{1}{X_c^2} = \frac{1}{2.629^2} = 0.1447$

$\frac{1}{(\Sigma X_c^2)} = \frac{1}{3.775^2} = 0.0702$

Tandem value, $\Sigma\ (1 / X_{co}^2)$ 0.2149

General part potential, (*Primary split C*) $X_{co} = \frac{1}{\sqrt{0.2149}} = 2.157$

Part potential, Split A, X_a = 1.837
Part potential, Split B, X_b = 1.623
Mine pressure potential, X_{po} 5.617

Mine power potential, (*After splitting*) $X_{u2} = \sqrt[3]{5.617^2} = 3.160$

Mine power potential, (*Before splitting*) $X_{u1} = \sqrt[3]{4.636^2} = 2.780$

For a constant power, the quantity ratio is equal to the power-potential ratio; thus,

$\frac{Q_2}{Q_1} = \frac{X_{u2}}{X_{u1}}$; $\frac{Q_2}{75{,}000} = \frac{3.16}{2.78}$; $Q_2 = \frac{75{,}000 \times 3.16}{2.78} = 85{,}240$ *cu.ft. per min.*

Mine pressure, $p = k\left(\frac{Q}{X_p}\right)^2 = 0.00000002\left(\frac{85{,}240}{5.617}\right)^2 = 4.6$ *lb. per sq.ft.*

Power on the air, $u = k\left(\frac{Q}{X_u}\right)^3 = 0.00000003\left(\frac{85{,}240}{3.16}\right)^3 = 11.9$ *hp.*

Inquiries of General Interest

A Coking Question

I would very much appreciate an answer to the question, Can an oven bottom be made too hot when coking coal, and how will this affect the quality of the coke produced?

J. T. MULLEN,

Chestnut Ridge, Penn.

In response to the above question submitted to him, J. R. Campbell, chief chemist, H. C. Frick Coke Co., very kindly sends the following interesting reply.

Referring to your recent communication, permit me to say that I would not like to answer the question, "Can an oven bottom be made too hot to make good coke?", categorically, as by so doing one might easily be led into a controversy. In the genuine beehive oven, the coking process is naturally downward toward the bottom of the oven, in order to produce coke having no cleavage. But, shutting off the draft by closing the dampers in the doors and covering the trunnel-head and allowing the oven to stand thus for several hours, the bottom of the oven may be made hot enough to start coking upward. A cleavage would then result in the coking mass some distance above the bottom, similar to what occurs in the byproduct oven, which, however, is not objectionable as long as the bottom bench is A No. 1 coke. In some instances, the same result is produced by means of flues. In my opinion, coking upward from the bottom of beehive ovens would not always be productive of the best results, as the ends of the coke would be apt to be charred and spongy.

J. R. CAMPBELL.

Everson, Penn.

Study Question--Acceleration of Load in Hoisting

A former examination question answered in COAL AGE some time ago (Vol. 4, p. 357), gave the unbalanced load hoisted in a shaft, including frictional resistance, as 4550 lb., which was the load on the engine. The ascending load, including the weight of the coal, car, cage and friction, was 7700 lb.

Some of us would appreciate a fuller discussion of this problem, showing the method of calculating the acceleration of the load when hoisting. In other words, when starting the loaded cage from the bottom, through what height would it ascend before attaining the full velocity of the hoist (20 ft. per sec.); and, again, at what distance from the upper landing would the engineer close the throttle, so that the ascending loaded cage may come to rest naturally, just above the "keeps?" This is, of course, a purely theoretical question; but it draws attention to the fact that the best engineers, who make the easiest landings, learn the point when to shut off the steam so as to land the cage easily on the "keeps," assuming the ropes are even.

S. A. DRIVER, Supt.,
Sibley Bros. Coal Co.

Warrior, Ala.

Hoisting, in a double-compartment shaft or a balanced hoist, is similar to the operation of the well known Atwoods gravity machine of physics, used for determining the force of gravity by experiment. In this case, the accelerating force is the difference between the descending and ascending loads, or the load on the engine (4550 lb.), while the entire mass accelerated is represented by the sum of these loads. When the loaded cage is at the bottom of the shaft, the weight of the rope hanging in the shaft (640 lb.) must be added to the ascending loaded cage, making the total ascending load 7700 + 640 = 8340 lb. The load on the engine being 4550 lb., the effective descending load is 8340 — 4550 = 3790 lb., and the sum of the two loads is then 8340 + 3790 = 12,130 lb. The acceleration (f), under these conditions, is

$$f = \frac{4550}{12{,}130} \times 32.16 = 12.06 \text{ ft. per sec.}$$

The height above the landing at which the ascending loaded cage would attain the full velocity of 20 ft. per sec., is, then,

$$h = \frac{20^2}{2 \times 12.06} = 16.5 \text{ ft.}$$

When the loaded cage arrives near the top of the shaft, the weight of the rope has been transferred from the ascending side to the descending side, making the ascending load, 7700 lb. and the descending load, 4430 lb. The difference between these two loads, or the accelerating force, is now 3270 lb., while the weight accelerated remains unchanged. The calculation is the same as before, the acceleration being 8.67 ft. per sec.; and the height below the upper landing at which steam should be shut off is then 23.07 ft.

Mining Coal with Heavy Parting

Referring to my previous inquiry, in this regard, COAL AGE, June 13, p. 981, the point I am particularly anxious to ascertain is what will be the probable difference in the cost per ton of producing coal, when workng a seam of clean coal, 4½ to 5 ft. in thickness, as compared with the seam previously mentioned, consisting of two 30-in. benches of coal separated by a dirt parting varying from 6 to 18 in. in thickness. Further, cannot coal be produced as cheaply or even more so, in the working of a 5-ft. seam containing 12 or 14 in. of parting, than in the working of a thin seam from 2½ to 3 ft. in thickness, other conditions of roof, floor and overburden being the same in each case?

FRED MORCK.

Warren, Penn.

In attempting to answer this question, it must be considered whether the extra coal in the 5-ft. seam with a 12- or 14-in. parting will pay for the handling of the dead material in the parting. In most cases, this question would be answered in the affirmative. In actual practice, much will depend on whether the dirt in the parting can be separated readily from the coal and whether it can be mined or if it will require to be blasted from the seam. These practical conditions always determine the question of economical mining. We shall be glad to have the question fully discussed as it has an important bearing on the mining of many seams in different coal fields.

Examination Questions

Mine Managers' Examination Held at Springfield, Ill., June 15, 1914

(Continued from last issue)

Ques.—The distance between a pair of cross-entries is 500 ft.; from the main entry to the boundary line is 1000 ft.; the thickness of the seam is 6.5 ft.; and the loss or wastage, in slack and dirt, is 15 per cent. The specific gravity of the whole seam is 1.3. Estimate the tonnage of coal that can be mined from this block, if 25 per cent. of the coal is left for pillars.

Ans.—The coal having a specific gravity of 1.3 weighs in the solid $62.5 \times 1.3 = 81.25$ lb. per cu.ft. The number of cubic feet of solid coal per ton is, therefore, $2000 \div 81.25 = 24.6$ cu.ft. Allowing 15 per cent. for loss in mining and 25 per cent. for pillar coal not to be taken out, the coal mined is $100 - (15 + 25) = 60$ per cent. of the capacity of the seam. The cubic capacity of the coal mined is, therefore, $0.60\ (500 \times 1000 \times 6.5) = 1{,}950{,}000$. Under the assumed conditions, therefore, this volume of coal represents a tonnage of $1{,}950{,}000 \div 24.6 = 79{,}269$ tons; or, say 80,000 tons.

Ques.—With a fan 8 ft. in diameter, making 250 r.p.m. and passing 62,000 cu.ft. of air per min., if the water gage reads 1 in., what is the equivalent orifice of the mine?

Ans.—The term "equivalent orifice" is antiquated, and the question is, further, somewhat misleading in giving the diameter and speed of the fan, as these factors do not enter into what has been understod as the equivalent orifice of the mine, which is

$$\textit{Equivalent orifice} = \frac{0.0004 \times 62{,}000}{\sqrt{1}} = 24.8\ \textit{sq.ft.}$$

As applied to the fan, this term is a misnomer, for the reason that fan calculations are all made on a basis of power. A centrifugal fan has no fixed ratio of water gage to quantity, which depends on the mine resistance.

Ques.—A tank measures 3x4 ft. and is 2 ft. deep; it is made of ½-in. boiler plate. If placed in water, how deep would this tank sink?

Ans.—The superficial surface of the bottom of the tank is $3 \times 4 = 12$ sq.ft.; and that of the sides, $2 \times 2\ (3 + 4) = 28$ sq.ft., making the total superficial area of the tank $12 + 28 = 40$ sq.ft. Allowing 10 lb. per sq.ft. for each ¼ in. of thickness of the boiler plate, the weight, in this case, is 20 lb. per sq.ft. of surface, which gives for the total weight of the boiler plate $20 \times 40 = 800$ lb. To this must be added, say 10 per cent. to allow for the additional weight of laps and rivet heads at the joints, making the total weight of the tank, say 880 lb.

The depth to which this tank will sink is determined by the volume of an equal weight of water which it displaces. The volume of this water is $800 \div 62.5 = 14.08$ cu.ft. The area of the bottom being 12 sq.ft., the depth to which the tank will sink is $14.08 \div 12 = 1.173$ ft., or, say 14 in.

Ques.—A tank measures 4x4 ft. and is 5 ft. deep; when placed in water, it sinks 9 in. What is the weight of the tank?

Ans.—The depth of the tank (5 ft.) does not enter this calculation. The area of the bottom of the tank is $4 \times 4 = 16$ sq.ft. Since 9 in. is ¾ ft., the volume of water displaced is $¾ \times 16 = 12$ cu.ft. The weight of this water, which is also the weight of the tank, is, then, $12 \times 62.5 = 750$ lb.

Ques.—If a seam of coal rising 1 in 8 meets an upthrow fault 12 ft. high, how far back would a tunnel rising 1 in 5 require to be started in order to reach the coal at the top of the fault?

Ans.—Assuming the rise in each case is based on horizontal measurement, and that the upthrow fault is vertical, and calling the required distance back for starting the tunnel to meet the seam beyond the fault, x; since the rise of the seam is 1:8, its total rise in this distance is $x/8$. Likewise, the total rise of the tunnel in the same distance is $x/5$. The difference between these two rises or the amount of upthrow being 12 ft.,

$$\frac{x}{5} - \frac{x}{8} = 12$$

$$8x - 5x = 40 \times 12 = 480$$

$$3x = 480;\quad x = 160\ ft.$$

The tunnel must therefore be started back 160 ft.

Ques.—Two shafts are on the same surface level and each is 300 ft deep. The water gage at the bottom of the upcast shaft reads 29 in. What will it read at the bottom of the downcast?

Ans.—This is an unintelligible question. The given reading (29 in.) may refer to the reading of the *barometer* at the bottom of the upcast shaft, instead of a "water-gage" reading, as stated. It would be impossible, however, to tell what the reading of the barometer would be at the bottom of the downcast shaft, without knowing the reading of the water gage, due to the mine resistance. This water-gage reading has evidently been omitted from the question. However, assuming, for sake of convenience, that the water-gage reading is, say 2.72 in.; since mercury is 13.6 times as heavy as water, the corresponding difference in barometer readings, due to the mine resistance, would be $2.72 \div 13.6 = 0.2$ in. In this case, the reading of the barometer at the bottom of the downcast shaft would be greater than that at the bottom of the upcast shaft by 0.2 in.; or the reading at the downcast shaft would be 29.2 in., under these conditions.

Ques.—The depression produced by a fan is equal to a 1-in. water-gage, and the fan is consuming 10.4 hp. If the efficiency of the fan is 60 per cent., how many cubic feet of air is the fan producing?

Ans.—The efficiency of the fan being 60 per cent., the power on the air, in this case, is $0.60(10.4 \times 33{,}000) = 205{,}920$ ft.-lb. per min. Since 1 in. of water-gage corresponds to 5.2 lb. per sq.ft., the quantity of air in circulation is $205{,}920 \div 5.2 = 39{,}600$ cu.ft. per min.

Coal and Coke News

Harrisburg, Penn.

Bills for the state tax of 2½ per cent. ad valorem on the anthracite coal prepared for market were mailed by the auditor-general to 110 coal companies of the state on July 1. The bills will run close to $2,300,000, and the companies will have the usual period in which to pay or appeal to the courts.

The bills are for the tax on the output for 1913, being calculated on the reports filed by the companies. The sending of the bills is independent of the action now pending in court to test the constitutionality of the act, on which briefs were recently submitted by a number of companies and by the attorney-general.

What Is a Miner?

An answer to the mandamus proceedings brought to prevent issuance of certificates as mine formen or assistants to miners who, it is claimed, did not have five years' experience cutting coal will be filed in the Dauphin County Court at an early date, and in all probability the case will be argued before the end of the summer. The action was brought by the United Mine Workers of the Schuylkill region and raises an interesting question of what constitutes experience as a miner. The preparation of the state's side of the case has been delayed by the illness of Chief of Mines James E. Roderick, whose department will be represented by Deputy Attorney-General J. E. B. Cunningham.

Miners throughout the state are paying particular attention to this mandamus proceeding, as the chief of the Department of Mines holds that five years' experience in mining does not necessarily mean five years' actual work at the face, cutting coal. The miners' attorneys contend that miners must work five years at the face. The decision will affect hundreds of miners and may have an important bearing on the miners' certificate law, as well as on the bituminous miners.

Some Railroad Rates

The Public Service Commission has granted permission to trunk line carriers to postpone until Oct. 29 the tariffs previously issued by them providing for charges for so-called spotting service performed by such carriers. The tariffs were originally issued to become effective May 27, but by permission of the commission were postponed until July 1, and are by this latter action again postponed until Oct. 29, to which date such issues were postponed by the Interstate Commerce Commission. This has the result of delaying until Oct. 29 any attempt on the part of the carriers to enforce charges for spotting on either interstate or intrastate traffic.

The Pennsylvania R.R. on July 3 filed with the Public Service Commission a joint answer in behalf of the Northern Central, Philadelphia, Baltimore & Washington, Cherry Tree, Dixsonville & Monongahela railroad companies that the rates complained of by the Spreckels Sugar Refining Co. on coal consigned to Philadelphia for harbor delivery have been canceled and wants the complaint dismissed.

High Production Last Month

The production of anthracite coal last month was larger than that of June, 1913, and the official figures of the Bureau of Anthracite Statistics, which will be issued in a short time, will show shipments of over 6,000,000 tons. All of the principal companies, except one or two, report an output equal to or greater than the corresponding month last year. The Lehigh Valley Coal Co. expects that its final figures for the month will show 900,000 tons mined, which will be its high record for any one month. In May, 1911, it mined 800,668 tons, and in March, 1912, it produced 814,679 tons.

At the beginning of last month production as a whole was about 2,000,000 tons behind that of last year, but the summer discounts are proving attractive, and the consumers seem to have learned the wisdom of buying coal when coal is cheap. According to statistics recently compiled, 50.3 per cent. of the total shipments were sent out during the winter months last year, and 49.7 per cent. in the summer months, the difference betwen winter and summer shipments being less than 350,000 tons.

The labor situation in the anthracite fields is quiet, though there have been a few "button" strikes here and there, and complaints are heard from many of the operators about agitators trying to stir up trouble among the mine workers, who are glad of the increase in the number of working days during the summer months. From 1892 to 1901, the average time worked in the anthracite region was 179 days. Since the summer discount went into effect in 1902, in only one year, 1906, when there was a long suspension, has the number of days worked fallen below 200. In 1913 it was 257 days.

PENNSYLVANIA

Anthracite

Thropp—The union miners of this community are protesting against the making of motion-picture films depicting strike scenes. The men believe that these pictures will cause an unfavorable attitude toward the miners in places where they are not known. A moving picture company has been making the film for some weeks.

Plymouth—Operations at the breaker of the Parrish colliery of the Lehigh & Wilkes-Barre Coal Co. were suspended July 1. The colliery will remain idle for three months, after which time the output will be prepared for market at the new Buttonwood breaker at Breslau. About 100 men were employed in and about the breaker and the majority of them will be obliged to seek work elsewhere.

Ashland—A daring attempt to dynamite a Lehigh Valley pay train with $50,000 aboard was frustrated on June 30 by huckleberry pickers near Ormrod. The berrypickers discovered that the tracks had been blown up, ran eastward and flagged the train, which they knew was to arrive at Centralia to pay the empioyees of Centralia and Continental collieries.

Girardville—A 15-year lease between the Girard estate of Philadelphia and the W. R. McTurk Colliery Co. for the colliery at Girardville was placed on record in Schuylkill County recently. The lease runs until Dec. 31, 1928, and calls for the taking over of coal lands in the township of Butler and the borough of Girardville.

Glen Lyon—A large mule barn of the Susquehanna Coal Co. was entirely destroyed by fire on July 1, together with a large quantity of grain, hay and straw. The barn was a large one and represents a loss of about $17,000. The structure, which was about 50 ft. in width and 200 ft. in length, was of wood with a slate roof.

Hanover—There was excitement at No. 21 colliery of the Lehigh & Wilkes-Barre Coal Co. recently, when the headhouse of the air shaft was discovered on fire. The employees soon had a stream of water on the blaze, but were handicaped by lack of water pressure. The blaze was extinguished before much damage was done.

Bituminous

Glendale—Fire which broke out in the Glendale mine of the Pittsburgh Coal Co. on July 5 was extinguished the following day. The blaze started from an electric wire in one of the shafts. Men returning to the shaft shortly after noon found smoke curling from the entrance. The miners worked in relays finally extinguishing the blaze.

Cyrilla—The auction sale of Cyrilla No. 5 plant of the Sunshine Coal & Coke Co. has again been postponed until Sept. 12. This action has been taken after a second failure to receive satisfactory bids.

Charleroi—Poor shipping conditions on the Ohio River are given as the reason for the closing down of a number of coal mines along the third and fourth pools of the Monongahela River Consolidated Coal & Coke Co. and other firms. Practically all available barges have been filled and shipped to Pittsburgh to await such time as they may be shipped elsewhere. The remaining barges are on the Ohio tied up at storage places.

Rockwood—A test hole was completed on June 20 on the Barkman farm by Lewis brothers, who are operators and owners of a large mine at Hooversville. They have under option 3100 acres, the majority of which is in Milford township, underlying the farms of Jacob Barkman, Harvey Myers and Peter Koontz. The test hole was driven 300 ft. and

passed through two seams of excellent coal, specimens of which are now in the laboratory of a chemist for analysis. If the coal is of good quality, development of the field will begin at once.

Windber—Through the efforts of the Berwind-White Coal Mining Co., which offered prizes for the best kept premises, for flower beds and for lawns, the town of Windber is putting on a handsome appearance, hitherto unknown to the coal-digging suburb. The smart and well-kept miners' homes are attracting much favorable attention in neighboring communities.

Bentleyville—One of the largest new coal mining operations in the immediate Pittsburgh district in some years is being developed in Washington County, where the Pittsburgh-Youghiogheny Coal Co. is sinking a shaft and will shortly open a new mine that will employ over 450 miners and will have a daily output of approximately 3000 tons of coal. The mine is located in what is called the Van Voorhis district and the company has 1000 acres of coal land there to work.

Carroltown—The Carroltown mine of the Ebensburg Coal Co. is to be disposed of within a short time to the Carroltown Coal Co., according to reliable reports. The Carroltown mine is known as Nanty-Glo No. 2 and is one of the best openings in the northern end of Cambria County. The coal is the quality that seems to be always in demand. The Carroltown Coal Co. is also negotiating for the purchase of the Candy mine, near Spangler.

Monongahela City—Considerable uneasiness prevails over the Monongahela Valley mining district, as the result of various coal companies closing down on July 4 twelve mines, throwing out of employment from 3500 to 5000 men. It was announced that the mines would not be reopened for at least two months. The cause given for the layoff is that all the available barges are full and ready to be towed south. With this superabundance of fuel, it was stated, further mining is not necessary. The output of June was extremely low in all the mines along the valley compared with the usual tonnage.

Colver—An unusually heavy production of coal was recently made from mine No. 1 of the Ebensburg Coal Co. The output for June exceeded 92,000 tons and the officials and employees are highly pleased at this showing.

WEST VIRGINA

Charleston—Over 7000 men in the Kanawha district, idle since June 1, following a strike over the terms of the new wage agreement, have returned to work as a result of a favorable vote on a proposition submitted by the operators. The men will work under a limited check-off system, pending the adjustment of the wage scale by a board of arbitrators to be chosen by the two sides and the Secretary of Labor. It is understod that the wage scale will be worked out on a competitive basis with adjoining districts.

Williamson—After working 14 hours continuously, rescuers completed an emergency tunnel into the burning mine of the Sycamore Coal Co. late July 1, and found the bodies of five miners entombed by a mine fire the day before. It is believed this mine fire originated from a faulty electrical connection in the fan house, the draft of the fan carrying it into the mine and cutting off the five men from escape at the mine entrance, also the rescures from penetrating to them.

Eccles—Report has been made to the State Department of Mines that the operations of the New River Collieries Co. which were wrecked by an explosion on Apr. 28, are rapidly being repaired and that it will be possible to resume operations within the next six weeks. When the present repairs are completed, the mines will be in better shape than before the explosion took place.

ALABAMA

Birmingham—Orders aggregating over one million tons of coal have been closed in local circles during the past few days, and another is pending. It was recently announced that the Southern Ry. had confirmed its contract for approximately 700,000 tons, while the Atlantic Coast Line placed its requirements at 235,000 tons. Other roads owned by the Southern are now in the market for 150,000 tons of coal, while the Seaboard Air Line recently placed an order for 400,000 tons.

The Banner Mines of the Pratt Consolidated Coal Co. produced 45,000 tons of washed coal during June, breaking their record. The Flat Top mine of the Sloss-Sheffield Steel & Iron Co. produced 32,000 tons of coal during the same time.

Reports from Chief Mine Inspector Nesbitt's office show that the production of coal in Alabama for the first six months of 1914, is approximately 10,000,000 tons, and the indications are that the tonnage mined during the entire year will break the 1913 record. Mr. Nesbitt states that activity is being shown at all mines, improvements being made, machinery put in repair, and other necessary requirements to run full time and at full capacity.

Brilliant—W. H. Parker of Cullman, Cullman County, Ala., is developing a new mine at Brilliant, in Marion County.

KENTUCKY

Whitesburg—The Perry County Collieries Co. will soon start a coal operation on First Creek, Perry County's new coal field.

Hazard—Operations have been resumed by the Kentucky Jewel Coal Co. after a shutdown for six weeks on account of lack of power. The new generator has been installed and work will be pushed from now on in an effort to make up for time lost in filling orders. The Hazard Dean Coal Co., it is understood, has shut down for a lack of power, though pressed with orders. This firm also will install its power plant at once.

Barbourville—Pittsburgh capitalists are said to have completed a deal for 26,000 acres of coal and timber land in Clay county at the rate of $10 per acre. This constitutes the largest single deal ever made in Clay county and forecasts an early railroad extension into that county from here. The reputed purchasers were in Barbourville early in the season on an inspection tour. A railroad has been projected for some time from here to Manchester to traverse the coal and timber regions, rights of way have been obtained and activity in real estate has increased.

Harlan—Harlan county people, mine operators as well as others, are jubilant over the record of increased output shown by the coal fields of the county. In 1910 (before the railroad entered the county), it produced no coal. In 1911 the tonnage was 15,814, in 1912, it increased to 384,427, while for the calendar year of 1913, according to the figures of the state department, the total output reached 851,412 tons. This year, although the operations in the early part of the season did not immediately show the increase expected, the total output will compare with the gains in previous years and reach somewhere near the 2,000,000 mark.

OHIO

Columbus—Upon the application of Attorney James M. Butler, C. E. Haskins has been named receiver for the Starr-Hocking Coal Co. which has operations in Athens County, he giving bond in the sum of $20,000. He was the superintendent of the company.

Bellaire—The coal mine of the Carnegie Steel Co. on Indian Run was recently inspected by several of the state mine officials and found to be in first-class condition. The inspectors highly complimented mine superintendent R. F. Marling on the manner in which he had obeyed the state mining laws.

INDIANA

Terre Haute—The minority in the U. M. W. members in Indiana has called a special meeting for July 21, to consider charges that state officers have violated the terms of the wage contract in settling grievances in favor of operators. There are specific charges against William Houston president and Thomas Moss, member of the executive board.

ILLINOIS

Maxwell—The mines and mining committee of the County Board of Supervisors have set July 22 as the date for the inspection and survey of the Star mine, which is said to have been driven under county property. On that date the county engineer will go over the operation accompanied by a committee of supervisors to determine whether the mine actually extends beyond the property line of the Clarke Coal Co., which owns the mineral rights to the property.

Duquoin—A snake 5 ft. long and 4 in. in diameter crawled into the feed pipe from the pond at the Paradise mine last week, causing the property to be shut down, and throwing 400 men out of work for a day, until a new pipe was placed.

Hiram Thornsberry, first engineer at the Majestic mine, while oiling the machinery recently leaned too close to a flywheel and was picked up by it and crushed to death.

Belleville—Prospectors are drilling a test hole between here and Marissa to locate the thickness of vein No. 5, which underlies vein No. 6. Owing to the fact that a large portion of vein No. 6 is worked out, the property owners want to ascertain the value of the underlying coal bed in order to dispose of the mining rights.

Carterville—In one of the mines adjacent to this place, a rule has been put into effect that no miner shall load more than 9 tons of coal in 8 hours. The miners' union is in favor

of this, because it gives employment to a larger number of men, and there are thousands of miners idle in southern Illinois at the present time. The operating companies favor it because it gives the men more time to clean their coal and load it properly.

MISSOURI

Kansas City—The meeting of the executive board of the International Mine Workers was held in Kansas City during the week ending July 4. John P. White, president of the U. M. W. A., presided. Thirty delegates attended. The strike at Vancouver, B. C., was the chief topic of consideration.

Cainsville—The coal mine at Cainsville probably will resume operations in the near future. H. R. Waterman, manager, has secured new leases which give the landowners a royalty of 5 cents instead of 10 as in the past.

Warrensburg—George M. Boyd & Sons have purchased a steam shovel and will begin work on the George Burkarth farm near Warrensburg. The mine is the only one in that city.

KANSAS

Osage City—An ordinance fixing the prices to be charged operators for electric current has been passed by the city council. The charge to be made is 3 cents per kilowatt hour for all current supplied to mines outside the corporate limits of the city, provided that the operators will agree to pay a monthly minimum charge not to fall below $83.33 for each mining machine.

MONTANA

Bozeman—The Star Coal Co., of Musselshell, has purchased the steam plant of the Gallatin Valley Mining Co. at Belgrade and the hoisting engine of the Northwest Improvement Co.'s mine at Mountainside, and will shift both to Musselshell where the coal company is opening some valuable property.

PERSONALS

Charles Harvey, one of the best known mine foremen in the Lehigh region, who has been in the employ of the Lehigh Valley Coal Co. for the past five years, tendered his resignation on July 1.

B. P. Friend, a coal operator of Prestonburg, Ky., has been critically ill at the Palace Hotel, at Cincinnati. He was a spectator at a fire when an ammonia tank exploded. It is said that the vapor he inhaled caused his illness.

Cornelius P. Tory has been appointed superintendent of transportation of the Hocking Valley Railway company, succeeding Thomas R. Limer who died recently. Mr. Tory has worked his way up to his present position from the bottom.

John F. Brown, a miner, of Cannel City, Ky., has been appointed to the state board to examine applicants for mine foremanships by Governor McCreary. The law which created the board provided that one of the members must be an employed miner.

A. G. Spillman, General Superintendent of the St. Bernard Mining Company Earlington, Ky., was recently appointed by Governor McCreary as a member of the Board of Examiners, which under the new state mine law grants certificates to mine foremen.

Erskine Ramsey, Jones D. Moore, James E. Strong, W. S. Kahn, and Edward Husband were recently appointed by the governor of Alabama to serve on the State Board of Examiners. Erskine Ramsey was the only former member of the board retained.

OBITUARY

Richard White, aged 64 years, a retired coal operator of Pottsville, Penn., was found dead in his bed on the morning of June 30. He had been engaged in coal operations for the past 25 years and was well and favorably known throughout the entire anthracite region. Mr. White is survived by 8 children.

James McCormick foreman of the Jamison Coal Co. formerly of Latrobe, Penn., but who has resided at Barrackville, W. V., for some time past died recently after a brief attack of heart trouble. Mr. McCormick was 64 years of age, had been in the service of the Jamison company for some time and was a valued and trusted employee. He is survived by his wife and four children.

CONSTRUCTION NEWS

Windber, Penn.—John and Thomas Locthrie, who recently acquired the Manges coal tract, have started work on an opening on the Manges farm.

Nanticoke, Penn.—The Jenkins Contracting Co., of Mt. Carmal has been awarded the contract by the Susquehanna Coal Co., to sink a shaft at Nanticoke 540 ft. deep and 15x25 ft. in cross-section.

Whitesburg, Ky.—A new industrial city is being laid out below here in Perry County, one mile from Hazard, and equidistant from the four operations of the Ashless Coal Co., the Kentucky Jewel Co., the East Tennessee Coal Co. and the Virginia Coal & Coke Co. Already numbers of lots have been sold and several stores are in course of construction.

Bower, W. Va.—The Davis Colliery Co. is building one of the best store buildings to be found anywhere in this section of the state, to replace the one burned down some time ago. This structure will be of brick and cement and made as near fireproof as possible. The approximate dimensions are 35 ft. wide, 82 ft. long and three stories high with a basement the full size of the building.

Imperial, Penn.—Plans are being made by the Montour & Lake Erie Coal Co. for the opening of a new mine in Imperial. The full supply of machinery has been purchased and construction work will begin in a short time. The output of the mine will eventually be about 150 tons daily, and 350 men will be given employment. The work will be under the direction of Andrew Wilson.

Leavenworth, Kan.—W. J. Squire, president of the Squire Electric Co., of Kansas City, has taken over the old Brighton mine near Leavenworth and proposes to spend about $500,000 in its rehabilitation. The mine will be electrified and a power house will be built at its mouth. Other capitalists also are interested with Mr. Squire and the group has asked the city of Leavenworth for a franchise to sell light and power in that city.

Buffalo, N. Y.—Work has begun on the by-product plant of the Niagara Coke Corporation, which sometime ago bought 40 acres of land adjoining the works of the Lackawanna Steel Co. It is stated that $2,000,000 will be spent in setting up the plant and that it will be in operation with 100 ovens early next summer. The capacity will be doubled if necessary. The coke will be sold in the open market and the gas to the steel company.

Highland, Penn.—The G. B. Markle Co. houses at this place are at present in the hands of a force of carpenters, who will greatly improve the buildings and enhance their appearance. Front porches will be erected on every house, new fences constructed and additional improvements made to the interior. The roadway will be repaired and side walks laid. The company is to be commended upon the improvements being made to its mining towns in general.

Columbus, Ohio—The route of the proposed freight line of the Chesapeake and Ohio from Portsmouth to Columbus, Ohio has been finally determined upon. This action was taken by the board of directors at a recent meeting held at Maysville, Ky. According to the plans approved, the Ohio river bridge will be built at Sciotoville, seven miles east of Portsmouth. From that point the line will follow the Little Scioto River to a point east of Stockdale in Pike County where it will turn westward and meet the Scioto River. Neither Circleville nor Chillicothe will be touched. It is expected that the construction of the line will be completed in two years. Application to the U. S. War Department for permission to build the bridge will be made at once.

Whitesburg, Ky.—At least five branches are to be built by the Louisville & Nashville R.R. Co. this year into the Letcher-Perry coal field. One already started, will extend 5 miles up First Creek from Typo station to the development work of the Perry County Colleries Co. Another, of three miles, is to parallel Carr's Fork to the Knott county border, where an Eastern syndicate will start a coal and timber development. Davidson Creek will get a three mile branch just above Hazard, where the East Tennessee Coal Co. and the Ashless Coal Co. are starting big developments and from which they expect to be shipping coal within two months. A fourth line is being pushed up Big Leatherwood Creek as far as Daisy where developments are underway. Of the fifth and sixth extensions, one is to run from 12 to 16 miles to Line Fork, while Rockhouse Creek may be the terminus of the other. The Potters Fork, Yount's Fork and Bottom Branch lines of the L. & N., have been completed and the three branches are carrying coal and lumber.

NEW INCORPORATIONS

Linton, Ind.—The Twin Oak Coal Co. has dissolved.

Fargo, N. D.—The Dunn Coal Mine Co. at Leigh has been reorganized into a new firm to be known as the Black Diamond Coal Mine.

Charleston, S. C.—The Dry Fork Coal & Timber Corporation has been given the right to increase its capital stock from $45,000 to $300,000.

Wilmington, Del.—The Banner Coal Mining Co., has been organized with a capital stock of $50,000. Charles Francis Brown is at the head of the new concern.

Williamsburg, Ky.—The Letz Jellico Coal Co. has been incorporated with a capital stock of $100,000; the incorporators are J. W. Latham, J. R. Zimmerman and C. M. Smith.

Kansas City, Mo.—The Chilhowee Coal & Coke Co. has been organized with a capital stock of $200,000. The incorporators are Milton Walsh, H. B. Henry, and Arthur Nelson.

Pittsburgh, Penn.—The Peters Creek Gas Coal Co. has been chartered with a capital stock of $30,000. The chief incorporators are Charles W. Braznell, of Pittsburgh, and R. A. Braznell, of Edgewood.

Clothier, W. Va.—The Spruce Fork Coal Co., has been organized with a capital of $50,000, the incorporators are William B. Watkins, J. A. Wilcox, John L. Montgomery, H. E. Marlor and Andrew W. Border.

Scranton, Penn.—The Temple Iron Co. has been reorganized with a capital of $4,000,000 divided into $2,000,000 of 8% preferred stock and $2,000,000 of common stock. There will also be $2,500,000 in 5% bonds.

Nelsonville, Ohio—The Carter-Spencer Coal Co. has been organized with a capital stock of $50,000 for the purpose of mining coal. The incorporators are John Carter, Harry Ball, George S. Evans, J. T. Thompson, and J. N. Smith.

Tams, W. Va.—A charter has been issued to the Wyoming Fuel Co., which will have its chief works at Slab Fort in Wyoming County. The capital stock is $100,000 and the incorporators are W. P. Tams, Jr., John W. Wilson, James O. Watts, G. M. Vaughn and P. T. Watts, Jr.

Uniontown, Penn.—The W. A. Stone Coal & Coke Co., has surrendered its charter in West Virginia and has discontinued business as a corporation in that state. Albert Gaddis, of Uniontown was president of the company, the property of which has been purchased by the W. A. Stone Fuel Co.

Lexington, Ky.—The Commonwealth Coal & Timber Co. has been incorporated with a capital stock of $10,000 to develop coal and timber lands in Perry, Knox, Leslie and Letcher Counties. The incorporators are Samuel W. Wilson, president, Clinton M. Harbison, vice-president and treasurer, Samuel H. Halley and T. M. Smith, of Lexington, George S. Shanklin, Jr., of Whitesburg, secretary, L. W. Fields, of Whitesburg, manager, and Jesse Morgan, of Hazard.

Bristol, Tenn.—The Empire Coal & Land Corporation which failed two years ago as a result of a temporary financial stringency is to be reorganized and rehabilitated. A meeting of the holders of the $750,000 of the company's bonds was recently held at which a committee composed of H. G. Morrison, of Johnson City, T. F. Hogan and H. E. Jones, of Bristol and A. K. Morrison, of Big Stone Gap was appointed to draft a plan for reorganization.

INDUSTRIAL NEWS

Birmingham, Ala.—The Gulf States Steel Co. has recently put 300 coke ovens in operation at its Virginia mine after a short shut-down.

Drifton, Ala.—C. C. Gravelee has taken over the Borden Mines at Drifton, Walker County, Alabama, and will take steps to immediately increase the output.

Taits Gap, Ala.—The Taits Gap Coal Co., with mines at Taits Gap, Ala., is making improvements that will double its output. Watt Brown of Ragland, Ala., is president.

Scranton, Penn.—C. D. Simpson recently purchased the interest of the Yost estate in a tract of coal land comprising about 820 acres near Shenandoah for a sum said to be in the vicinity of $2,000,000.

Hamilton, Ontario—A large by-product coke plant is projected for supplying gas to the iron furnaces at Hamilton, Ont., in which the owners of the furnaces are said to be interested. The amount of natural gas developed in that vicinity in the near future will have a bearing on the new undertaking.

Columbus, Ohio—Owing to the prolonged coal strike, a big decrease is shown in the net and gross earnings of the Hocking Valley Railway company for the month of May, the report for which has just been made public. The operating revenue for the month was $442,016 as compared with $755,450 for May of 1913.

Hurricane, Va.—C. E. Bockus, vice-president of the Clinchfield Coal Corporation, Dante, Va., has just placed a contract with the Roberts and Schaefer Co. for approximately $50,000 for the design and installation of a Marcus patent, five-track steel coal tipple with a 600-ft. inclined car haul, all to be electrically operated, at the mine at Hurricane, Virginia.

Chicago, Ill.—The Chicago branch of Keuffel & Esser Co., of N. Y., has completed its removal to its new quarters, 516-518-520 South Dearborn St., Chicago. The company recently purchased this building and occupies the greater part of it. It is situated near the "loop" and half a block from an "L" station, being midway between Van Buren and Harrison Streets, on the west side of South Dearborn Street.

London, England—A new idea was presented at a recent meeting of the Iron & Steel Institute in London, concerning the by-products from coke making and the utilization of blast furnace gases. It is believed that synthetic rubber may be produced from coke oven gases, the President saying that "the experiments which have been made permit the foreshadowing of the manufacture of artificial rubber."

Fleming, Ky.—Beginning July 15 the Elkhorn Mining Corporation will make some large increases in its plants in Fleming, Haymond and Hemphill. The Lexington & Eastern R.R. has recently completed branch lines into Haymond and Hemphill and the shipment of coal has started on a large scale. Several hundred additional hands will be put to work on the 15th. The company contemplates opening some new mines.

Knoxville, Tenn.—A meeting of the creditors of the bankrupt Ideal Block Coal Co. was recently held in the Federal Court at Knoxville. The receiver, E. G. Stooksbury, of Knoxville, was unanimously elected Trustee and at the request of the creditors, was instructed by the Court to close out the affairs of the company and sell all tangible assets as soon as possible; pay off the preferred creditors, and report to the Court again on July 16.

Kansas City—The ouster order registered by the Missouri supreme court against the Central Coal & Coke Co. last fall has been withdrawn so long as that company, and others involved in the same case, show a disposition to obey the state laws. The fine of the company was reduced from $50,000 to $30,000. Though lumber companies were principally interested several coal and mining concerns were included in the list.

Cincinnati, Ohio—Judson Harmon, former governor of Ohio and Rufus B. Smith, both of Cincinnati have been appointed receivers of the C. H. & D. R.R. Co. The suit for receivership was filed by the Bankers' Trust Co., of New York. At the same time a mortgage for $36,000,000 held by the trust company is asked to be foreclosed. The petition declares the total bonded indebtedness of the road is $75,000,000. The cause for the receivership is given as the devastation of the flood of 1913 together with the business depression which has followed.

Columbus, Ohio—For the third time since a workmen's compensation act has been in force in Ohio, the commission having charge of the administration of the law has announced a radical reduction in the rates of insurance charged employers, the cut this time averaging about 6 per cent., as against a reduction of 10 per cent. in July, 1913, and of 22 per cent. in November, 1912. That of last year was made retroactive, and involved the return to employers of over $70,000. It is estimated that the latest cut, which is also retroactive, will involve the refund of $100,000 to employers, out of the surplus of nearly $2,000,000 in the hands of the commission. Over 1400 industries receive the benefit of the reduction, while two, stevedoring and freight car manufacturing, have had their rates increased, as a result of the experience of the commission showing the high cost of the insurance. Coal mining, among about a dozen industries, is left uncharged as to the rate charged, which is entirely satisfactory to operators, as they had anticipated an increase at the time of this readjustment of the rates.

Coal Trade Reviews

General Review

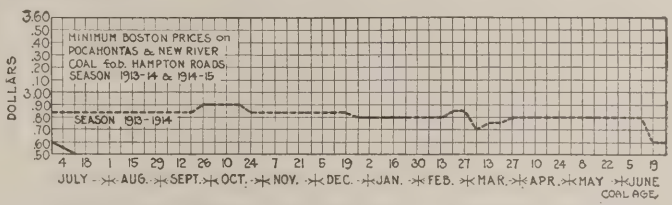
Curtailed mining in the anthracite regions and the market continues under heavy pressure. Eastern bituminous situation dull and weak, but gradually improving to the westward. Lake movement unsatisfactory. Agreement reached on the Ohio wage scale.

The heavy curtailment throughout the hard-coal regions last week had little effect upon the anthracite market, and further restrictions were necessary during the current week, with every indication that this will continue until the fall demand opens up. Under existing conditions, it is useless to urge sales. A large increase in the Lake movement is noted for last month, but the tonnage for the season is substantially less than last year.

The bituminous market continues generally heavy in all parts of the country, with down east New England points leading the slump. Large tonnages of consignment coal are coming in, while demurrage bills are accumulating, and there has seldom been such a wide margin between prompt and contract prices as now rules. Competition on new contracts is unusually aggressive. Shipments are confined more closely to requisitions on contracts, which have increased somewhat; but, on the other hand, the heavy export business of the past few weeks has slowed down materially. Operations in the mining districts tributary to the Eastern markets were somewhat stronger during the current week, although this was probably the result of the shutdown over the Fourth of July.

Reports of a car shortage at the head of the Lakes, with a consequent congestion on the docks, probably accounts for the slowing up in Lake shipments out of the Pittsburgh district. Some indications of an improvement are noted, and many of the agencies are optimistic over the outlook, though without tangible evidence of their reasons. Prompt business is invariably subject to substantial cuts, and even moderate concessions are heard on new contracts. The final agreement on the wage scale in most of the Ohio districts, subject only to the referendum vote of the miners, now places the operating companies there in a position to negotiate new contracts. As a result, there is considerable activity in trade circles, but the agencies are compelled to work hard for orders. Lake shipping continues slow, though with prices holding relatively firm, and some indications of an improvement.

The demand is somewhat brisker to the South, where the surplus tonnages are being used up, and there is less coal on demurrage than for a number of months; buyers are also showing less hesitancy about contracting, and negotiations are usually for longer periods. The Middle Western market is steady, with a strong rising tendency. The abnormally large crops and the uncertainty as to the possibility of a severe car shortage have created a moderate anxiety among consumers, who are now seeking to accumulate some surplus coal. Half-time operations are the rule at the moment, but this will be gradually increased as the crop movement gets under way.



ATLANTIC SEABOARD

BOSTON

Market coal still an affliction in this territory. Prolonged delay in disposing of cargoes. Hampton Roads grades still continue accumulating and no improvement in sight. Only a small movement of the Pennsylvanias. Dock screenings in short supply at the anthracite piers.

Bituminous—There is apparently no let-up to the volume of market coal being sent to the New England ports. Prices on Pocohontas and New River are therefore as weak as ever and perhaps the only change in the situation is in the longer time it takes to dispose of the coal. The demurrage bills must be heavy and the query is how long will West Virginia operators be willing to sand both the low level of prices and the expensive charges for vessel destination.

The few contracts still unplaced are soon coming into the market and all the agencies are interested to see what prices are developed. There has seldom been a season, however, when the discrepancy was so great between spot and contract coal for delivery over several months or a year. Some large buyers who usually make contracts are still buying from hand to mouth as bargains offer, and no doubt they have made a very large saving in doing so. The accumulation at Hampton Roads is still heavy, and once a loading order is issued it is only a matter of hours and minutes before the cargo is on the way. In all the ports there are steamers, barges, and sailing vessels awaiting charters and few in the trade can recall a time so absolutely dull in steam coals as the present.

In the Pennsylvania grades there is practically no improvement. Shippers of the preferred coals are able to keep mines running, although on short time, by selling at 10@15c. less than the season contract basis, but the less favored grades are having great difficulty in moving any tonnage whatever. Space in anthracite barges from Philadelphia is now available to most of the Pennsylvania coals and a somewhat better movement is expected in the course of the next few weeks.

Georges Creek is put on wheels only on firm orders and for application to contract. For spot sale there is almost nothing doing. Prices are nominal on the same figures.

Anthracite—So small an amount of domestic sizes has been dumped over the piers the last week or so that the supply of dock screenings is short. The large city dealers rely on a fairly regular supply and are scurrying around to procure shipments of rice and barley as a temporary expedient. July promises to be dull in anthracite also and no demand is looked for until stocks begin to move to the consumer in September.

Current prices on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*.....	$0.85@1.45	$1.20@1.60	$1.67@1.77	
Philadelphia*.....	2.10@2.70	2.45@2.85	2.92@3.02	
New York*.....	2.40@3.00	2.75@3.15	3.22@3.32	
Baltimore*.....	.....	.....	2.85@2.95	
Hampton Roads*.	.....	.....	.....	$2.50@2.80
Boston†.....	.....	.....	.....	3.15@3.63
Providence†.....	.....	.....	.....	3.20@3.68

* F.o.b. †On cars.

NEW YORK

Temporary improvement in bituminous but aggressive competition for business prevails. Anthracite trade soft with all grades in easy supply.

Bituminous—Some slight increase in orders has developed during the week. Requisitions on contracts are a trifle heavier and mining operations have been increased at some points. Although this has created a somewhat better feeling among the trade, the improvement is due, in most part, to the curtailed operations over the holiday of last week, and, in any event, it is not of sufficient proportion to create any general optimism.

What few contracts remain to be closed are subject to aggressive competition among the selling agencies. Of these, the most important yet to be signed is the contract for the New Haven subsidiary companies involving about 120,000 tons of coal, and this is usually low priced business. Some minor contracts are being signed up, from time to time, as they expire. Consumers who have held off contracting this year have done much better than those closing early in the season, which is in direct contradistinction to conditions prevailing last season.

A little western Maryland coal is still occasionally reported on demurrage, but the volume is insignificant and the market is in unusually good shape in this respect. Bunker-

ing trade continues light. Prices are not quotably changed from last week, which we continue as follows: West Virginia steam, $2.50@2.60; fair grades Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The market is generally soft on all sizes. Stove coal is now the only grade selling at the full circular, and some additional tonnages of this might be used in some instances, but, as a rule, orders can be promptly filled. There is an unconfirmed rumor to the effect that the Reading Company has 400,000 tons of chestnut coal in storage. Pea and buckwheat grades are, of course, going into storage but not in such large volume now that mining operations have been restricted.

Egg and nut coal can only be moved by giving the buyer a certain proportion of stove; even under these conditions, concessions of 10 to 25c. are made on egg coal and 15 to 40c. on the regular circular can be done on nut. Straight nut has been offered at $4.75 at the lower ports. Pea is in about the same condition, selling at 30 to 40c. off the circular. The low-grade buckwheats are quoted at from $2 up, with the high grades at $2.55; the low grades of No. 2 are at a minimum of $1.50, with the high grades at $2.15, while the high and low grades of No. 3 can be obtained at $1.60 and $1.25 respectively.

The New York hard-coal market is now quotable on about the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$4.90	$4.60@4.90	$4.85	$4.55@4.85
Egg	5.15	5.00@5.15	5.10	4.90@5.10
Stove	5.15	5.15	5.10	5.10
Chestnut	5.40	4.95@5.40	5.35	4.75@5.35
Pea	3.55	3.40@3.55	3.50	3.10@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.00@2.75
Rice	2.30	2.15@2.30	2.00@2.25	1.50@2.25
Barley	1.80	1.60@1.80	1.75	1.25@1.75

PHILADELPHIA.

Little change noted in anthracite market. Curtailed operations generally in effect. No immediate improvement looked for. Bituminous maintains its listless attitude, with demand weak.

Anthracite—Judging from reports emanating from all sections of the country, the anthracite situation is not likely to show much improvement during the coming two months. Retailers generally claim that the industrial depression has made funds so low, that they hesitate to put coal out on orders, where the customer states that it is likely to be well into the fall before he will be in a position to settle the bill.

Curtailed operations at the mines has improved the situation to a certain extent, but the market still fails to absorb certain sizes. Broken egg and stove seem to be moving fairly well, but the balance of the sizes are in excess of the requirements, and as a result, there are reports that considerable coal is still going into stock. It is nevertheless a fact that the large operators are handicapped in placing their output because of the heavy concessions offered by the individuals. April and May prices for egg and chestnut are plentiful; pea is selling at even less than contract price, and where this fails to bring results the added attraction of the absorption of the state tax, is made.

The demand still centers on stove size, which is moving freely. In fact, it is understood that none of the companies have been able as yet to accumulate any of this grade, which is in marked contrast with two years ago, when stove was practically in the same position as now exists with chestnut. What remedy will be applied is problematical, but the continued falling off in demand for chestnut, is likely to force the issue.

Bituminous—Purchasing agents are shopping around the market at the present time, and solicitations that they contract, meet with slight success. The future holds out little hope for improvement either in demand or prices. Fair Pennsylvania coals are quoted at 90c. to $1 and the better grades $1.25 to $1.35, at the mines.

BALTIMORE

Market continues dull and flat. Severe car shortage anticipated this fall. Exports for June break all previous high records.

Except for the contract business the coal trade East remains remarkably dull. Efforts to force the market has resulted in some sacrifice sales, and the move is not being pushed. The West Virginia gas-coal situation is still being aided by call from the Middle West, and three-quarter that is selling East around 85c. is good for 10c. higher to Western customers in many cases. Pennsylvania fuels remain steady in the face of a listless call.

Car movement continues poor. This condition has been a figure now for several weeks and there seems little prospect of a change. Coal men fear that when the rush of business comes in the late summer and fall that the railroads will be in worse shape for prompt movement than has been the case for a number of years past. Less has been expended for equipment and upkeep recently than has been the case for a considerable period.

In anthracite the usual summer deliveries are now being made. Most dealers report things flat, but believe that the trade will have a busy and profitable late summer and fall season.

With a splendid total of 116,313 tons of bituminous exported for the month of June, the records of the port of Baltimore on this class of business were shattered. The highest previous record was made in June, 1913, when a total of 110,091 tons was exported. The shipments last month have a total value of $323,125. About one-quarter of the coal went to France, a comparatively new purchaser in this field, and the balance was widely distributed, being taken by the Philippines, Cuba, Italy, Egypt, Costa Rica, Porto Rico, Panama and Spain.

HAMPTON ROADS

Shipments for week somewhat light. Few inquiries for spot coal. Dumpings for month of June totaled 965,991 tons.

While coastwise shipments for the week have been about fair, the foreign movement was light, few cargoes moving. The largest shipments have been to Genoa and Venice, with some coal moving to Canal Zone, La Plata, Montevideo and Cuba. In addition to this the government has loaded one steamer with a cargo for the naval station at Cavite and Olongapoo, P. I.

Little if any high-volatile coal is being moved and there is no demand for this or prepared coal. There are few inquiries even for New River or Pocahontas run-of-mine, and such shipments as have been made so far as can be ascertained have been mostly on contract.

The total dumpings at the piers for the month of June amounted to 965,991 tons. Of this the Norfolk & Western dumped 500,444 tons, or more than the combined tonnage of the Chesapeake & Ohio and Virginian Rys., the Virginian dumping only 222,837 and the Chesapeake & Ohio 242,710 tons. While the tonnage for the month has not been as heavy as for the same period in 1913, conditions have also been somewhat different, and the total was more than was expected generally.

LAKE MARKETS

PITTSBURGH

Demand slack and mining operations slightly reduced. Lake movement decreased rather than increased Prices still irregular.

Mining operations in the Pittsburgh district have undergone a slight decrease, apart even from the decrease which naturally comes from the celebration of the national holiday. The line demand has fallen off a trifle and there has been a little decrease in Lake shipments. The ore movement continues relatively light so that vessel tonnage is not very plentiful and from the Northwest come reports of car shortage and consequent congestion of docks.

The market continues ragged as to prices, large contracts when negotiated, frequently going at concessions from the regular list, while free coal almost invariably is subject to cutting. Slack is selling at 50@60c. for prompt lots. Circular prices remain: Slack, 80@90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in., $1.50, per ton at mine, Pittsburgh district.

BUFFALO

Indications of an improvement in bituminous. The fall car shortage will create a shortage. Small consumers coming into the market. Anthracite will not move till fall, but will be brisk then.

Bituminous—There are a few jobbers who claim to see an improvement. They say that the wave of returning business is starting and that it will be here with the movement of the fall crops. There is better buying on the part of most of the small consumers, but the railroads and other large concerns are still holding off. There is a good reason for the demand being light. With the salesmen it has been a matter of how much they could urge upon the consumer, ever since the car supply became plenty last fall. In fact it was the car shortage alone that produced the brisk trade last summer.

Meanwhile the bituminous trade will hold a firm hand and see that there is very little coal on track unsold and where it has to be turned over unexpectedly there will be

great care and dispatch in doing it. The margin on any sale is too small to admit of any loose practices. In fact some mine owners are confessing that they cannot operate at a profit.

There are plenty of jobbers who refuse to sell coal at reduced prices, although others having off grades are accepting reductions. The circular remains at $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack. The market for slack is especially dull. Allegheny Valley prices are 15 to 25c. below Pittsburgh for sizes. The mines are not running much above half-time.

Anthracite—It is useless to urge sales, as the consumer seldom purchases in midsummer and is, if anything, buying less now than usual at this time of the year. When the cool weather sets in, there will be the usual rush. The mines are not running strong, as there is a prospect of a filling up of all storage space before the movement begins. As a rule the small dealers are not trying to help out. They cannot be made to see that there is profit in carrying a stock of coal through the summer.

Shipments of anthracite from this port for the week were 173,000 tons and for June, 805,879 tons, as against 642,110 tons for June last season. For the entire season the amount was 1,409,325 tons and for last season to July, 1,785,974 tons. The gain of more than 150,000 tons last month after a slow start shows the eagerness to make the most of this movement during the slack season.

COLUMBUS

Agreement on the wage scale in most of the Ohio fields stimulates some activity. Considerable contracting. Domestic business increasing and prices stronger.

With the settlement of the strike, more activity is shown in Ohio markets. Steam users who have been getting their supply from West Virginia and Kentucky are looking to make contracts for Ohio coal. Due to the suspension, very few steam contracts had been made recently. Manufacturing is still slow as a result of business depression and requirements are at a low ebb. Railroads are making steam contracts at a lower figure than prevailed last year.

In the domestic trade more activity has also developed. Dealers' stocks are generally small and they have been loath to push trade under those conditions. With better supplies they will soon be in a position to furnish coal for stocking purposes. There is a marked preference shown in this market for Pocohontas and re-screened varieties. Domestic prices show a slight strengthening. Lake trade is also expected to be more active in the near future and preparations are being made to ship a large amount of coal to the Northwest via the lakes.

What quotations are being made in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump	$1.50@$1.40		$1.50@$1.40	$1.50@$1.40
¾-inch	1.35@ 1.30	$1.20@$1.15	1.35@ 1.30	1.30@ 1.25
Nut	1.30@ 1.25		1.25@ 1.20	1.25@ 1.20
Mine-run	1.15@ 1.10	1.10@ 1.05	1.15@ 1.10	1.10@ 1.05
Nut, pea and slack	0.85@ 0.80		0.85@ 0.80	0.80@ 0.75
Coarse slack	0.75@ 0.70	0.85@ 0.80	0.75@ 0.70	0.70@ 0.65

CLEVELAND

Midsummer inventories and holiday shut-downs have reduced the coal requirements for the time being. Settlement of Ohio wage-scale. Fourth of July holiday causes a congestion at Lake ports.

Following the shut-down for the Fourth of July several large industries in Cleveland and surrounding cities have closed for repairs and inventory, thereby curtailing the demand, but without bringing a material reduction in prices. The trade continues to hold to orders and very little free or consignment coal is on track. The demand is for current use and prices vary not more than 5c. from quotations. Unless coal is sent on consignment or was purchased when the market was lower, no important concessions are being made.

Fairmount coal is coming in in small quantities as the gas-coal operators there are holding to higher prices. Youghiogheny, Pittsburgh and Richland, West Va., No. 8 are the only coals being offered on the market. Fine coal, which is about the only size in any demand, is being sold at $1.60 to $1.65.

With the adjustment of differences with the miners in the Hocking, Jackson, Pomeroy, and part of Crooksville districts, some Ohio coal will be offered here within a few weeks. These fuels do not come into this market as a rule unless prices are high, and there is little reason to expect much Ohio coal as the Lake trade will take all the Hocking produced before Oct. 1. It is a general practice to ship the Lake trade all the Hocking up to Sept. 15 or Oct. 1, after which the all-rail business is taken care of.

The Lake trade is not improved from what it was a week ago. Youghiogheny, Fairmount Gas, splints and Pocohontas have been going forward, but not in as large quantities as they should. The Pocahontas operators have not been able to dispose of the slack produced in making the prepared sizes and therefore have curtailed shipments of these grades as much as possible. This has resulted in the Lake contracts getting the benefit, though a broader market for slack would increase Lake shipments.

Hocking shipments will increase the Lake trade somewhat and will probably also increase the congestion at the docks in Toledo. With the exception of the C. H. & D. dock at Toledo every coal loading dock on Lake Erie was shut down on both July 4 and 5. The C. H. & D. had thirteen vessels waiting July 2 and several boats were due July 3. Boats arriving at Sandusky, Lorain and Toledo July 3 were mostly too late to go out before the docks shut down for the holiday.

There were so many boats waiting to unload at Lake Erie ports Monday morning that congestion was the rule. This resulted in a large number of vessels being sent to the coal docks to wait for coal to come in, and it will be a week or ten days before the docks are able to load ships as promptly as they have the last two weeks. Vessels have been held two to three days up to this time.

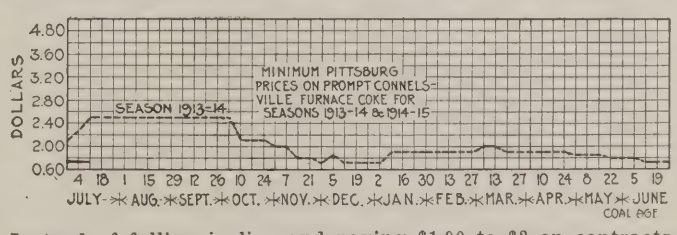
Quotations, Cleveland prices, for shipment are as follows:

	Pocahontas	Youghiogheny	Fairmount
Lump	$3.60		
Lump, 1¼-in.		$2.35	
Lump, ¾-in.		2.25	$2.05
Mine run	2.60	2.10@2.15	1.95
Egg	3.60		
Nut		2.20	
Slack	2.20@2.35	1.55@1.60	1.65

CINCINNATI

Dullness continues in all departments. Demand so poor that operators have difficulty in disposing of even a limited production.

With July well started, the coal trade has been expecting almost daily indications of an improvement in the market, but so far it has failed to materialize. Failure of the steam market to pick up is not difficult to understand, in view of the fact that most of the manufacturing industries are operating on slow time; but it is not easy to see why the domestic market remains dull. Operators are of the opinion that substantial stocks have been carried over from last season, both by dealers and domestic consumers. But on the other hand the demand during the latter part of the winter was very dull, the consumers apparently relying upon their diminishing stocks to carry them through. Even with fairly liberal transportation facilities available on the Lakes, the movement there continues slow, indicating that the market is fairly well supplied.



Locally the demand continues slow for domestic grades, smokeless being the sole exception, as usual. Dealers are apparently not at all anxious as to supplies later on, despite the shortage which must inevitably result from the situation in the Ohio and West Virginia fields. A better tone is anticipated, although there seems to be little tangible reason for this.

COKE

CONNELLSVILLE

Market receives setback. Consumers buy July coke at much less than demanded on second-half contracts.

The coke market has received a decided setback. Sellers were greatly encouraged by contracts placed some ten days ago, three lots aggregating 27,000 tons a month over second-half going at $2, the top price asked for some time.

Instead of falling in line and paying $1.90 to $2 on contracts—the coke sold at $2 being of particularly high quality—the other consumers who were uncovered have proved that they could buy prompt and July coke of fair grade at about $1.75, and have covered for short periods at this price, so as to put off the necessity of making contracts. The operators who were holding out for $2 maintain the position but recognize that they can hardly obtain the figure until iron and steel conditions improve considerably. Such an improvement is now fully expected. The market is quotable as follows:

Prompt furnace (including July) $1.75@1.80; contract furnace, $1.90@2; prompt foundry, $2.30@2.50; contract furnace, $2.35@2.50, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ending June 20 at 271,553 tons, a decrease of 1022 tons, and shipments at 270,397 tons, an increase of 10,132 tons.

BUFFALO

There is said to be a special reason for the general dullness in coke. The byproduct coke manufacturers are active and increasing, so that it is not believed that the Connellsville district will ever fully recover its lost ground. The economy of the byproduct oven is hard to compete with. Prices are as dull as ever, being on the basis of $4.25 for best 72-hr. Connellsville foundry and $3.25 for stock coke.

BIRMINGHAM

Coke market exceedingly quiet, both on foundry and furnace grades.

There is really nothing much to say regarding the Birmingham coke market. With the exception of a little spurt about last December, the market in this district has been very weak. Some of the manufacturers of high grade 72-hr. foundry coke state that their business has been fairly satisfactory, while the manufacturers of 48-hr. furnace coke complain that there is nothing doing. No immediate improvement is looked for, at least until the iron market picks up.

CHICAGO

The coke market is slack. There is sharp rivalry for what business develops in foundry coke with a tendency to cut prices. The circular price for byproduct advanced July 1 to $4.75 Chicago, and gas-house coke has been reduced from $4.25 to $4.15. Connellsville and Wise County are quoted at $5@5.25.

SOUTHERN

BIRMINGHAM

Lump coal market weak and steam grades only fair. Blacksmith coal about the same. Fairly good tonnage of pig iron sold, though prices are low.

The lump coal market is very weak, few sales of any importance being made, and the indications are for a rather hard summer. Steam coal is little better than lump. Although some contracts are being made, these were more in the nature of renewals, and had already been discounted. Blacksmith coal seems to be holding its own both as to tonnage and prices. The producers of this grade state that business is fairly good. A good tonnage of pig iron was sold on the approximate basis of $10.50 f.o.b. Birmingham.

LOUISVILLE

Eastern Kentucky market active. Buyers inclined to cover their requirements and drop out of the prompt market.

Though conditions in the western Kentucky field continue backward, the situation in the eastern Kentucky field has shown greatly increased activity. Domestic coals are in more than brisk demand at a ten- to fifteen-cent advance, while stocks of steam sizes are being rapidly cut down and there is much less on demurrage than for the past three or four months.

In western Kentucky, sales are being made at what the market will bring, no stable basis having been established; the mines are working from one-third to two-thirds full time. The quotations for eastern Kentucky coals vary from 40 to 75c. for nut and slack; 90c. to $1 for six-inch run-of-mine; $1 to $1.05 for steam run-of-mine and from $1.60 to $2 for block coals, all prices f.o.b. mines.

MIDDLE WESTERN

INDIANAPOLIS

Mines on half-time, with a few doing slightly better. Crop movement near and railroads will be larger buyers then. Prices at lowest summer level, with exception of slack.

The mines, as a whole, are on half-time or possibly a shade better, with some companies doing much better, and a very few on practically full time. The industry is waiting for the improvement expected with the beginning of the crop movement. The railroads have been putting thousands of cars in readiness for this, and they will be larger consumers, while it is expected related industries will also show more activity. The money put in circulation by the crop movement should create a demand in many lines that will improve general industrial conditions.

Slack is the only grade for which the demand seems to tax the supply. It is selling at 80c. to 90c., as against not much more than one-half of that at this time last year. This may be due to the Keokuk dam across the Mississippi, which has cut down the demand for slack about 50,000 tons a day. Retailers report a good summer movement of domestic grades to consumers' storage bins.

CHICAGO

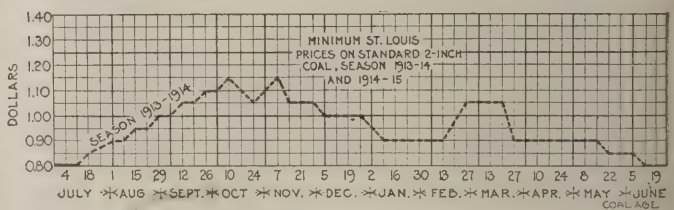
Chicago dealers expect to handle an unusually large tonnage next fall. The market is already moving toward a better position. Production being restricted.

It is estimated that the amount of coal moving into Chicago at present is about 30% normal and when the fall rush begins it is expected that operators will be confronted with inadequate transportation facilities. The railroads have purchased only a small number of new cars and engines and in many instances have permitted their rolling stock to deteriorate. This means that a record coal tonnage must be moved during both a low railway efficiency and a small car supply.

There is a stronger tone to the smokeless market. A large amount of this fuel on track has been disposed of and comparatively little is being forwarded. On this account dealers are able to adhere to the circular price which advanced to $2 a ton July 1, on smokeless lump and egg. The demand has been good. Orders from the country for splint coal are arriving in considerable volume. As a number of the mines are still closed down by a strike, the amount of this fuel received in Chicago has been reduced.

Prevailing prices are:

	Springfield	Franklin Co.	Clinton	W.Va.
Domestic lump	$2.07	$2.40@2.55	$2.12	
Steam lump	1.97		1.97	
Egg		2.40@2.55		$4.05
Mine-run	1.87	2.15@2.25	1.87	3 30
Screenings	1.67	1.95	1.67	



Quotations on Harrisburg coal are: Domestic lump and egg, $2.40; steam lump, $2.25; mine run, $2.15@2.25; screenings, $1.95; No. 1 nut, $2.55; No. 2 nut, $2.40.

Carterville prices are: Lump, $2.40; egg, $2.40; No. 1 washed, $2.55; No. 2 washed, $2.45.

ST. LOUIS

Slightly better movement, particularly on the higher grades. Steam trade stationary and anthracite dull.

A slight picking up in the way of tonnage for the first few days in the month indicates that business will be fairly good for the next week or ten days. The market did not advance on screenings, as it was expected to; as a matter of fact, all steam coals remained stationary, with a tendency to weaken if anything. The higher grade coals show a better movement, with a tendency towards a higher price, especially on the domestic sizes.

Anthracite is still slow, with very little moving, and the same applies to coke. Smokeless is unusually dull, with plenty under demurrage at East St. Louis, and anthracite is the same. Prospects are, however, that the middle of the month will see a better movement of everything.

The prevailing prices are:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump			$1.15	$0.85	$0.95
3-in. lump					
6-in. lump	$1.15@ 1.35		1.25	1.00	1.15
Lump and egg	1.85@ 2.15	$2.00			1.15
No. 1 nut	1.15@ 1.30				
Screenings	0.85@ 0.90		0.80@0.85	0.75	0.75@0.80
Mine-run	1.00@ 1.15			0.75@0.80	
No. 1 washed nut	1.30@ 1.40	2.25	1.50		
No. 2 washed nut	1.20@ 1.30		1.35		
No. 3 washed nut	1.15@ 1.25				
No. 4 washed nut	1.15@ 1.25				
No. 5 washed nut	0.70@ 0.85				

KANSAS CITY

Harvesting demand about satisfied. Shortage in the supply of fuel oil will create an increased consumption of coal.

Future bookings have continued to measure above those for the corresponding period a year ago. Most of the mines in this section are running about four days a week, with some operating even more fully. Much of the demand created by the wheat harvest in Kansas and other states has ceased, though some shipping will be done until August.

A feature of developments of the past week was the announcement by the Standard Oil Co. that it will be unable to supply big consumers of fuel oil after Oct. 1. This means that the industrial concerns which have relied on oil will necessarily install coal burning equipment. Consumption will be heavier during the coming fall than ever before, according to present indications.

PORTLAND, ORE.

Market featureless, with very little business transacted.

This is the time of year when there is little doing here in the fuel trade, and this year is no exception to the rule. The warm weather keeps the consumer's thoughts from the coal bin and little is being bought now for storage, although the summer rates have gone into effect. Most of the mines in the Pacific Northwest are working slow, many of them operating enough only to supply regular customers, such as the railroads and manufacturing industries.

PRODUCTION AND TRANSPORTATION STATISTICS

BITUMINOUS COAL MOVEMENT

The following is a summary of the movement of coal and coke over 13 principal railroads during April and the first four months of the last two years, in short tons:

	April		4 Months	
Anthracite	1913	1914	1913	1914
Baltimore & Ohio[1]	123,602	129,220	557,994	536,762
Chesapeake & Ohio[1]	2,176	1,903	4,343	4,954
Erie[3]	753,072	726,237	2,711,120	2,854,845
Pennsylvania[1 3]	930,592	1,070,562	3,674,096	3,776,953
Virginia[2 1]	45	.....	356	102
Total 5 roads	1,809,487	1,927,922	6,947,909	7,173,616

Total 10 roads	2,471,818	1,945,837	10,132,712	7,527,200

Total Coal and Coke, 13 Roads	1913	1914
January	19,266,202	18,124,936
February	17,546,496	15,419,489
March	17,631,345	20,201,479
April	16,850,690	15,463,143
Total, 4 months	71,294,733	69,209,047

[1] Includes coal from connecting lines.
[2] Includes company's coal.
[3] Does not include company's coal hauled free.
Note:—The Southern Railway hauled 339,126 short tons of bituminous coal during March, and 987,968 short tons during the three months.

SOUTHWESTERN TONNAGE

The following is a comparative statement of the Southwestern tonnage for January of the years 1913 and 1914:

State	1912	1913	Increase	Decrease
Missouri	305,825	277,609		28,216
Kansas	523,605	526,300	2,695	
Arkansas	183,648	162,056		21,592
Oklahoma	366,859	333,125		33,734
Totals	1,379,937	1,299,090	2,695	83,542

This statement only covers the tonnage of members of the association, which is estimated to be at least 95% of the entire production.

ANTHRACITE SHIPMENTS

Anthracite shipments for June and the first six months of the current year as compared with last year were as follows:

	June		6 Months	
	1914	1913	1914	1913
Phila. & Reading	944,816	1,155,107	6,031,648	6,858,384
Lehigh Valley	1,325,982	1,183,821	6,155,075	6,592,131
Cent. R.R. N.J.	839,514	851,445	4,389,087	4,575,664
Del. Lack. & West.	941,868	827,714	4,598,506	4,789,360
Del. & Hudson	661,248	568,352	3,415,875	3,504,539
Pennsylvania	470,652	510,341	3,217,088	3,167,106
Erie	738,175	661,892	3,990,027	4,079,792
Ont. & Western	207,931	211,375	1,148,483	1,284,878
Total	6,130,186	5,970,047	32,945,789	34,851,854

SAULT STE. MARIE CANALS

Coal shipments through the Sault Ste. Marie Canals for June of the current year were as follows in short tons:

	U. S. Canal	Cana. Canal	Total
Anthracite	344,989	69,412	414,401
Bituminous	1,512,894	333,795	1,846,689

FOREIGN MARKETS

GREAT BRITAIN

June 26—There is very little doing on account of the British Marine Engineers' strike. Spot supplies are obtainable at comparatively cheap figures, but sellers are holding for high prices for forward deliveries.

Approximate quotations:

Best Welsh steam	$5.04@5.28	Best Monmouthshires	$4.08@4.14
Best seconds	4.68@4.80	Seconds	3.84@3.90
Seconds	4.44@4.56	Best Cardiff smalls	2.58@2.64
Best dry coals	4.32@4.50	Seconds	2.46@2.52

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those of Monmouthshire descriptions are net f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.

Coke is quoted at: Special foundry, $6.24; good foundry, $4.80@5.52; furnace, $4.08@4.56.

SPAIN

Spanish imports for the three months to Mar. 31 in metric tons were:

	1913	1914
Coal	640,958	695,293
Coke	91,387	91,525

RUSSIA

The following shows the output of coal in the various districts during 1912 and 1913:

	Millions of poods*	
District	1912	1913
Donetz coal	1086.58	1268.34
Donetz anthracite	217.98	292.61
Dombrowa (Poland)	394.53	426.31
Ural	47.50	60.16
Moscow	12.93	17.12
Caucasus	4.27	4.27
Total	1763.79	2068.81

The above corresponds to an increase of 17.3 per cent.
*1 ton = 62.028 poods.

French Coal Imports at Rouen—All records for imports of coal were exceeded in 1913 with a total of 3,174,818 tons against 2,488,687 tons in 1912, the increase being almost exclusively due to shipments from Great Britain which furnishes nearly all of this article. Imports of anthracite were 250,438 tons. Total imports of German coal in 1913 were 149,525 tons. The excellent equipment at Rouen for loading and unloading coal is thought to be partly responsible for the route being so largely used to reach interior France, facilities of the port permitting the discharge of 3300 tons of coal in 9 hr. Four-fifths of the coal imported into Rouen by sea is reshipped to interior France. Less than a third is forwarded by railroad; of the remainder, delivered in barges, Paris and ports on the Seine receive most, but barges from Rouen bearing English coal go far beyond. In western France they deliver cargoes at Alencon, Mans and Tours to compete against the importations of coal from an opposite direction; by the network of waterways in central France they reach Montargis and Dijon, and by the system of canals of the Oise, the Aisne, and the Marne this water-borne coal arrives to compete against France's own coal mines in the markets of Amiens, Soissons and Nancy; anthracite ascends to the industrial centers of the Vosges, the Meuse and the Haute Marne, to be utilized at gas plants.

Financial Department

Pittsburgh Coal Co.

M. H. Taylor, chairman of the board of Pittsburgh Coal Co., says in his report for 1913:

Production—The total tonnage produced and handled for the year, including coke, and exclusive of coal purchased and handled by the dock companies was 24,707,204 net tons, an increase over 1912 of 644,822, or 2.68%.

While 1913 began with large stocks and a lessened demand, due to weather and trade conditions, an early improvement in the latter permitted all of the mines to average fairly full operating time until the last quarter of the year, when, influenced by free shipments made from all fields and by the recession in general business which then set in and continued for the balance of the year, demand fell off, with the result that the tonnage increase shown on the nine months to Oct. 1 of 6.58% was reduced to 2.68% for the whole year. Transportation facilities were good and efficient, and under no unusual shortage on labor or labor troubles, the output for the year would have largely exceeded 1912 through ability to produce and handle, could it have been placed.

Earnings—An increase of 35% in net earnings for the year on 2.68% tonnage increase—indicates the application of efficiency to the different plants in sales, production, handling and distribution; and especially, that all producers have been forced by their necessities to obtain a price which would more nearly represent the expense, risk and value of their product. By reason of the vast general production of the country, always increasing, its accompanying wastes and higher costs with a decreasing labor supply, prices must continue to advance until there is a substantial reduction in the present heavy percentage of labor charge by mechanical development. A better selling value is required to improve living conditions, to reduce personal injury risk, for proper compensation when sustained, and to secure a larger recovery of the coal.

Bonds—No new bond obligations have been assumed since last annual report and there has been retired during the year in principal of bonds and mortgages the sum of $1,965,243, of which $1,720,243 was paid out of working capital, and $245,000 from bond sales proceeds under Pittsburgh Coal, Dock & Wharf Co. mortgage of Apr. 1, 1912, reserved for the purpose. The principal of total bonded and mortgage debt, direct and indirect, at the end of year, was $31,154,255.

Improvements—It is realized that efficiency in selling, mining and distributing the output must always be had to obtain best general results against competition to be met, and to this end the large investments have been made during the past five years at mines, docks and yards. Some of the results for 1913 come from these investments for modern facilities, and each year should increase their service. Dock No. 5, West Superior, Wis., has been completed, and its operating results are fully up to expectations, as also those of Dock No. 7, Duluth, Minn., continue to be. Lime Island dock went into operation Aug. 30, 1913. Further construction should be added to No. 5 dock, and also to Algonquin dock at Sault Ste. Marie, Mich., when the company is in position to do so. Maintenance and operation of each unit have been directed to promote "safety first."

There is no floating debt other than current obligations for operating and maintenance, except for special construction work, the cost of which has been provided for by reserved bond sales' proceeds, and usual notes issued by subsidiary companies for coal in stock.

Minor troubles, general labor shortage amounting in the average to 15% through the busy season, compliance with safety provisions required by law, unusually heavy personal injury payments, and average higher prices for supplies, have increased production cost at the mines.

The past year practically completed the change from air and steam to electric power, either made or purchased, which, with standardizing equipment at the mines, has been a heavy past charge to operation.

To maintain effective production, three new mining plants are now in course of construction on the line of the extension of the Montour R.R., and are expected to come into operation during the present year.

Coal Reserves—At the end of the year there were owned and held 150,516 acres of the Pittsburgh vein. Should there be no greater annual exhaustion than during 1913, and no further acreage be hereafter acquired, that now owned will continue the life of the company for about 54 years, as a whole, with the other veins in reserve.

Preferred Dividends—It has been a regret to your directors that discharging debts and building up the physical structure of the company has so far deferred any adjustment of the dividend arrearage upon the preferred stock, amounting to 40.58⅓%, as of Dec. 31, 1913.

Due to its present physical and financial condition, its trade position, and a belief in its ability to maintain earnings up to an average better than the past under like opportunities, your directors have felt for some time that they would be warranted in taking the matter into considertaion, in the hope that some adjustment plan might be found that the company could undertake and be acceptable to the shareholders; and, therefore, a committee of the board has been named to first consider and advise what plan or course, in its judgment, could be recommended, but action by it has been delayed on account of the continuing unsettled business situation, and will be until improvement in it permits.

Forecast—A conservative expectation of results for the year is warranted, based on tonnage movement so far, consequent increase in production cost and uncertainty of trade requirements, although there has come a more general feeling of encouragement for the future, with some improvement in demand. Production cannot reach the total of 1913 on the present level of general business, nor become active again until its excess now carried in stock has been used. Both cost and selling value are involved in the renewal of the biennial wage agreement which expires Apr. 1, not yet arranged. Full trade requirements of the company will be maintained and can be met, after possible interruption of running time for these causes to some extent, by the reserve capacity of the plants and handling facilities which the company now has, with labor and transportation supply.

Results for Calendar Year

(Including Monongahela River Consol. Coal & Coke Co. in 1913)

*Produc. (tons 2,000 lb.)	1913	1912	1911	1910

*Properties owned Dec. 31, 1913, consisting of coal lands, mine plants and equipment, railways, railway cars, docks on Great Lakes, etc., were: Coal lands and real estate, less allowance for depletion of coal lands $61,700,387; plants and equipment, less depr., $20,114,629.

COAL AGE

Vol. 6 NEW YORK, JULY 25, 1914 No. 4

In many mining communities the entire political, social, moral and educational welfare of the inhabitants is dependent on the whims of the colliery superintendent.

The sanitary condition of the camp, the hospital facilities, the Sunday school, the common school, the condition of the dwelling houses, the character of the saloon or its successor, the blind tiger, the water supply, the goods carried in the commissary—surely in all the world's history no one class of men have had more complete control of a people's affairs than that possessed by the average coal superintendent.

There are children being born into our large mining camps every passing day, who will grow to manhood and then follow on down to old age, without ever changing their place of residence.

If they have no opportunity for education, are reared amid unhealthful surroundings, are offered no encouragement to acquire culture and independence, the blame, in all probability, will be traced back to some superintendent who failed to realize his responsibility.

And yet, in spite of all these facts, you will find plenty of superintendents who never have seemed to realize that their responsibility extends beyond their monthly cost sheet, and if questioned, they would have to admit that they have never given any time to an examination of their tenements except when some miner threatened to move on account of a leaky roof; and as for the moral atmosphere of the camp, they have never so much as given it a thought. Such superintendents generally have families that consider themselves above mingling with the people who live in their town and, as a consequence, even the wives of these superintendents know little about the requirements of the camp's inhabitants.

There is another type of superintendent whose intentions are good in the beginning, but often, after being opposed once or twice by his men, while attempting to inaugurate reforms, he gives up in disgust and attends strictly to the orders issued by the Big Boss from the general office. It was of such men that Pascal was probably thinking when he said: "Man is neither angel nor brute and the unfortunate thing is that he who would act the angel acts the brute."

Of course, if a superintendent has risen from the ranks, has never seen a modern camp and is unacquainted with modern conditions, very little can be expected from him if left to follow his own ideas, but in the present status of the coal industry, such a man would be hard to find.

No; every one knows what a modern mining camp looks like (there is always one in the neighborhood), but there are plenty of camps still in existence whose destinies are presided over by superintendents who have never taken time to inquire as to what might be accomplished and what ought to be accomplished.

If every mining camp was an incorporated village, how long do you think it would take the politicians to convince the populace that the man in charge of their affairs needed waking up; and how long do you think it would take the superintendent, after once being aroused, to convince the same populace that he and he alone could carry out the dreams advocated by the politicians?

All of which leads us to suggest that whenever you happen across a superintendent who is bored to death and complaining of his narrow sphere of usefulness, take a few minutes off to carefully and earnestly explain to him some of the possibilities that some of his neighbors have uncovered, and, as a final argument, give him this thought from Schiller: "When man is raised from his slumber in the senses, he feels that he is a man, he surveys his surroundings and finds that he is in a state.

Written Expressly for Coal Age

I usta be da greata man
For spenda money free,
I usta rush da growler-can
One beeg sport—datsa me;
But seence I meet one leetla girl,
I was'e no more, no sir,
I no have spent a seengle cent
Onless I spen' on Her!

I usta—when I leave da mine
Go straight to beer-saloon,
But now I go an' dressa fine
An' then you see me soon
Go walking weeth a leetla girl
Weeth softa eyes an' brown,
An' hair that's creenkle up an 'curl
Da preetiest in town!

Now every time I load a car
I say myself, I say,
"Dere, Tony, datsa go so far
To help for earn your pay,
You worka jus' so hard like dat
An' sava all da time,
Like wise ol' guy an' bye an' bye
Dose wedding bells is chime."

You be da merry bachelore?
Believe me, datsa fake—
You got no theeng for livin' for
W'at use da cash you make?
You listen to da wisa man
An' queet dat dizzy whirl,
You wanta be so smart like me
An' get a leetla girl!

Coal Pulverizing and Mixing Plant

By H. H. Kress*

SYNOPSIS—In order to increase both capacity and quality of product, large additions were made to the crushing and mixing apparatus at this coke plant. Both of the results sought were secured.

About a year ago the Hamilton Otto Coke Co., of Hamilton, Ohio, enlarged its works at Cokeotto, located near Hamilton, by installing a modern type of coal-pulverizing and mixing equipment. The output of this company is marketed extensively for domestic and foundry uses, and the increased demand necessitated an enlargement of facilities. The general view of the plant with the additional equipment is shown in the accompanying photograph.

General View of Crushing and Conveying Plant, Hamilton Otto Coke Co., Hamilton, Ohio

E. M. Peters, president of the company, stated shortly after the work was completed that "the new machinery and auxiliary equipment consisting of a track hopper, elevating, pulverizing and complete coal-mixing plant was installed primarily to improve the structure of our coke. From the pulverizing alone a decided improvement in the quality of the product was noticeable. After considerable experimenting with different kinds of coal as a mixture, a further improvement was achieved, so that at present the quality of coke we are producing, both chemically and structurally, is superior to most beehive and equal to any byproduct coke on the market."

The enlarging of the plant was accomplished by the installation of additional new equipment, consisting of a complete plant, built parallel to the old one, which can be seen on the right side of the illustration.

The equipment operated prior to the installing of the new was inadequate. The plant was not large enough to produce the output demanded. The old installation consisted of a railroad track hopper, a crusher underneath it and an inclined scraper conveyor, a large central storage bin, about 100 ft. from the track hopper, received the crushed coal from the conveyor. Modern facilities were lacking on the former equipment and the quality of coke desired was not obtained.

The coal carried to the storage bin by the old inclined conveyor could not be distributed evenly. The new equipment is more modern in every way, having a capacity for handling 100 tons of coal per hour. The equipment consists of a track hopper, a Jeffrey single-roll crusher, a vertical bucket elevator, an inclined bucket elevator, two compartment bins, a mixing plant, a common hopper, a Jeffrey swing-hammer pulverizer, and an inclined bucket conveyor, all of which may be seen in the photograph.

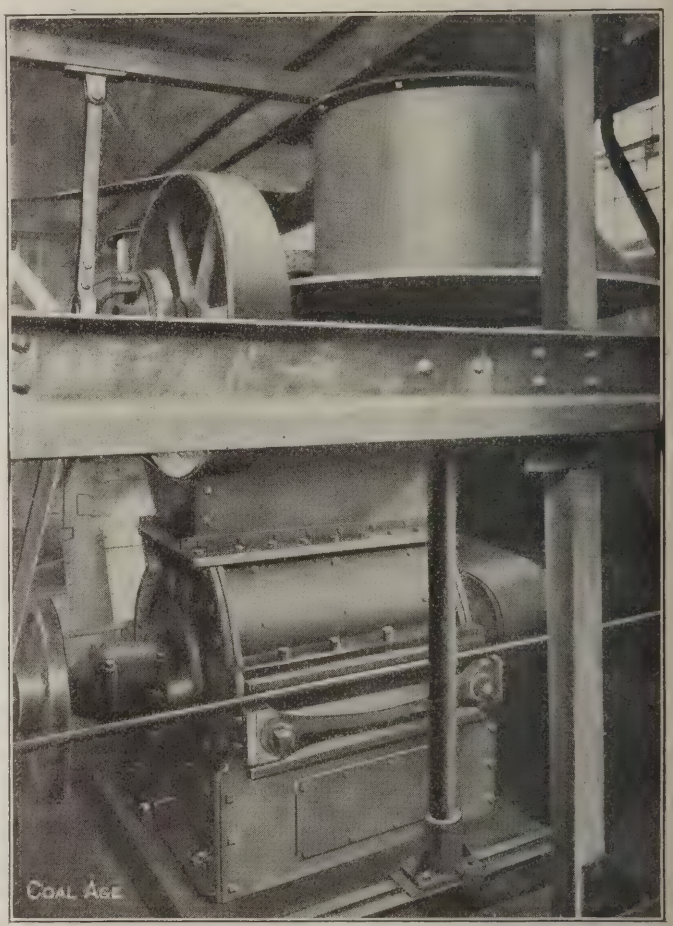
The run-of-mine coal, after being dumped into the new track hopper, is carried by means of a 36-in. beaded flight conveyor to the Jeffrey 30x30-in. single-roll crusher

*Jeffrey Mfg. Co., Columbus, Ohio.

and reduced to 1½-in. cubes and smaller for convenience in elevating, mixing and pulverizing.

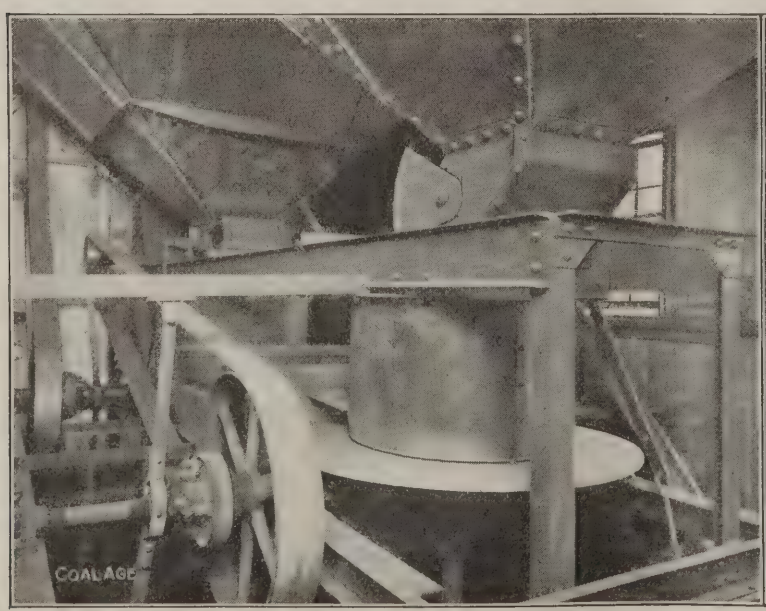
The continuous vertical bucket elevator delivers the crushed coal into the two compartment bins, having a capacity of 100 tons each. These are shown in the accompanying photograph. Two different kinds of coal are stored in the bins. The vertical bucket elevator is equipped with a chute, having a lateral, with a valve connection for the distributing of the different grades of coal into the bins. This operation is handled by a single employee, who keeps the bins filled at all times.

The quality of coke depends upon the mixing of the coal proportionally before entering the pulverizer. The mixing is accomplished by two 60-in. dia. horizontal circular-disk feeders, arranged to gage the feeding from 1:10 to 1:3, as desired by the operator. The coal is then delivered into the common hopper.



The 36x42-in. Jeffrey swing-hammer pulverizer is driven by a 100-hp. motor at about 1000 r.p.m. The coal by this operation is reduced to the proper fineness and is ready for the large central-storage bin.

The inclined continuous bucket elevator picks the coal up at the base of the pulverizer and conveys it either to the inclined bucket conveyor or to the inclined scraper conveyor. In the accompanying photograph can be seen the lower construction of the conveyor, also a portion of the chute that feeds the buckets. Another chute is provided to deposit coal into the old scraper conveyor should it become necessary to operate in this way.



The inclined bucket conveyer operates in a shaft 140 ft. in length and is constructed entirely of steel. A flight of steps is supplied at the side for convenience, and the structure is covered with a wood siding and roofing of a standard prepared composition.

The distribution of the pulverized coal to the central storage bin was improved with the installation of the new equipment. The coal when carried to the bin by the inclined bucket conveyer is taken by a reversible scraper conveyor and dumped uniformly to all parts of the bin. The conveyer is 59 ft. long and traverses the entire length of the storage bin.

The storage bin is directly above the ovens and was built before the new equipment was installed. The latter are of the Otto Hoffman type, composed of two batteries which parallel both tracks, extending on either side of the storage bin, as shown in the photograph. The crushed coal is taken from the central storage by electric larries operating along a steel framework and dumped directly into the ovens.

TYPE B PULVERIZER

GENERAL VIEW OF DISK FEEDERS

SECTION OF BUCKET OUTFIT

The working parts and machinery of the plant are easily accessible. The entire space where the machines operate is covered with diamond-tread iron floor plates, allowing ready access to the working parts without disturbing the rest of the machinery. It requires four electric-driven motors to operate this plant.

The new equipment above described was designed and erected complete by the Jeffrey Mfg. Co., Columbus, Ohio.

Extracts from a Superintendent's Diary

The word adventurer has always held a great fascination for me, but I'm afraid it lost most of its glamour today. I've been employed superintending the checking in and arrangement of quarters for the carload of strike-breakers who arrived from New York last night.

Surely they are adventurers. Of every nationality and occupation imaginable, and displaying by their talk and manner the abandon and fearlessness used as stock in trade by our popular story writers, they are easily classified. But—

Fiction writers overlook the animals that travel with these people—lice.

Fiction writers don't tell us about the filthy habits and the loathsome diseases that these men discuss continually.

Fiction writers don't even hint at the moral depravity that seems to have taken possession of these human beings.

In fact, I realize now that fiction writers are concerned mostly with what these men do, and they leave to our imagination the consideration of what they really are.

For example, I noted particularly one bright-looking young fellow who, according to his story, had twice circled the globe. He has worked at different times as sailor, "news butcher," hotel porter and circus roustabout, and, without effort, he amused a crowd of our mine guards and company men for hours at a time. Just his "brogue" alone was so amusing that he could have held attention by simply talking, but in addition to his brogue his adventures were most surprising and quite in keeping with the expectations of his audience. But every now and then he would unconsciously let out a little of sure-enough personal history, and then some of our older and more thoughtful men would look serious. It didn't take them long to realize that if this young fellow were accepted into some of their homes and allowed to roam at will he would, ere long, leave behind him a trail of misery quite as difficult to wipe out as a siege of bubonic plague.

It soon became evident that this young fellow was no better and no worse than the others; only he, being somewhat younger than his companions, had less control of his tongue.

Gradually during the day we picked up the life stories of many of them, and, while they varied greatly as to beginnings, they agreed closely as to present tendencies. The same apparent desire to stage all of their adventures in slum surroundings was characteristic of all of them, irrespective of the favorable early training which some of them claimed and, strange to say, I caught myself wondering what effect they would have on the slums, rather than what effect the slums would have on them.

Of course, we have been outrageously imposed upon by our labor agents in the North. We requested experienced miners, and instead we have been furnished with a carload of men, most of whom never saw a coal mine and have no intention of laboring in one even now. They have their eyes pointed toward a large city just south of us, and they figured, no doubt, that this was a good opportunity to secure free transportation at least part way. But even though they all disappear by morning, their advent in our midst will not soon be forgotten. We've had an opportunity to contrast our men with other men of the world, and we're bound to have a higher opinion of them because of it. It's unfortunate that more of our miners were not brought in intimate contact with these men, but of course, during times of strife, we can't afford to let down the bars just for sociological effect.

And it's quite possible that some of our young women will be able to realize that perhaps our young men, as a whole, are worth catching after all.

An Increase in Coke Production in Indiana and Illinois

The production of coke in Indiana in 1913 was, according to E. W. Parker, of the U. S. Geological Survey, 2,727,025 short tons, valued at $13,182,136, this being an increase over 1912 of 110,686 tons in quantity and $643,451 in value.

All the coke made in Indiana is the product of retort ovens, most of the coal coming from West Virginia. With the completion of the byproduct plant of the United States Steel Corporation, at Gary, in 1912, Indiana rose from a relatively low rank among the coke-making states to third place, outranking West Virginia, from whose mines the Indiana ovens receive the greater portion of their fuel.

The plant at Gary consists of 560 Koppers ovens which, in 1913, produced 90 per cent. of the entire output of the state. The total number of ovens in Indiana at the close of 1913 was 749, while 41 were under construction. Ten beehive ovens at Black Creek were abandoned. The 749 ovens had an average production of 3670 tons of coke, the yield from the coal used being 77.1 per cent.

All the coke produced in Illinois, as well as that in Indiana, is the product of retort ovens, which are fired mostly with West Virginia coal. The common practice is to mix the West Virginia coal with Illinois coal in the proportion of 4 to 1. This mixture is powdered before charging and has been found to make an entirely satisfactory coke with a yield of approximately 75 per cent. There are four establishments with a total of 568 ovens, all of which were in operation during the year; 58 ovens were in process of construction—40 at South Chicago and 18 at Joliet, both installations being additions to plants already established.

The production of coke in Illinois increased from 1,764,944 short tons, valued at $8,069,903 in 1912, to 1,859,553 tons, valued at $8,593,581 in 1913, or a gain of 94,609 tons and $523,678 in value.

It is remarkable that in neither of these states, Indiana or Illinois, are there any of the old-fashioned beehive coke ovens in operation.

Organization and Preparation for Mine Rescue Work

By George E. Sylvester*

SYNOPSIS—Although the Bureau of Mines has done much to put mine rescue work upon a solid basis, the political subdivision of government exercising control over the mining industry should logically organize and maintain a force to cope with emergencies. Training in first aid should approximate actual conditions.

Wherever bituminous coal is mined there seems to be no way to entirely eliminate the possibility of mine explosions.

The extensive investigations which have been made, the numerous remedies recommended, and now in use, have undoubtedly done much to minimize the number of such disasters. It is, however, probably a fact that the modern practice of mining, with its increased use of machinery, more rapid development, with more extensive and deeper mines, does, increase to some extent the danger of explosions.

While it would seem that with the increased use of preventive measures mine explosions should diminish, statistics show that there is but little, if any, gain. While doing everything possible for its prevention, we must admit that the explosion or mine fire remains a possibility, and although it may be a rare occurrence, we should be prepared to handle the emergency when it comes in the best possible manner.

A general mine explosion is usually too great a disaster to be handled by the individual company, which must rely on public aid. And to give aid in such cases is clearly a province of the state. The question to be considered is, therefore, how can such aid be given with the maximum efficiency and economy.

The oxygen breathing apparatus is recognized as one of the most effective instruments in rescue and recovery work after an explosion. The Bureau of Mines has thus far taken the lead in the introduction and practical use of this apparatus. It has tested out and given its approval to such types as were found practical for actual use; has given instructions and issued certificates of competency in the use of the equipment to a considerable number of the miners from practically all of the coal fields, many of whom have rendered valuable aid in emergencies; and the trained men in its service have given active assistance in many of our worst disasters.

While much of this work can only be done to advantage through such a department, its efforts must in the nature of things be largely investigative and educational, and the question of direct organization should be taken up by the power in direct authority.

The State Should Organize a Rescue Force

The state is the political division assuming the direct supervision over the mines within its boundaries. But with one or two exceptions the various states have thus far been content with the matter of regulation only, leaving the caring for emergencies to the volunteer services of the individual or to the Bureau of Mines. I think I am safe in making the assertion that the greatest need in rescue and recovery work after an explosion is organization.

Organization in such a case necessitates one direct head, who must assume entire responsibility, and definite units of men under their respective leaders who understand their particular work, and who will recognize and obey the proper authority.

The chief, or in his absence, the district mine inspector, is generally expected to assume supreme responsibility, and is logically the person best fitted to direct such organization, since the general mining law of the state gives him certain authority which the individual or the federal official cannot have.

At such times the organization of the mine itself is highly demoralized. Sometimes those in direct authority are among the victims or are not in condition to assume command. The mine officials, however, should, and usually do, act in conjunction with the inspector at such times.

If an inspector is to be expected to assume such responsibilities he should be given the necessary authority and the means to carry out this work to the best advantage. This means that there should be at his disposal, a trained organization and a fund upon which he may draw for any necessary expense.

There are two ways whereby a state organization for such emergencies, may be perfected. A permanent organization of picked men may be established under regular salary, who shall hold themselves in readiness for emergencies; or a volunteer corps, might be organized, distributed throughout the field; who while carrying on their ordinary work as miners, shall maintain themselves in condition, and hold themselves in readiness to respond to a call for their services.

If mine explosions were of frequent occurrence, which fortunately they are not, the former might be the more desirable method, although a force large enough to be effective would doubtless be expensive. With disasters as infrequent as they are at present, and with reason to hope that their frequency will decrease, the latter system seems to be preferable.

There is nothing new in such a system of organization. In the smaller towns and cities where fires are not of frequent occurrence, the volunteer fire department, when kept efficient by frequent drills, has proved to be the most effective way to economically handle this form of disaster.

A Rescue Organization Is Comparable to the Militia

The state has need of a military force to cope with emergencies yet maintains no standing army, relying on a volunteer organization, the militia. Sufficient compensation is given for drill and training, which latter does not interfere with the ordinary occupation of the member.

There seems to be no reason why an organization for mine rescue work, based on the same plan, should not

*Chief inspector, Mining Department of Tennessee.

Note—Abstracted from a paper read before the West Virginia Mining Institute, Cumberland, Md., June 3, 1914.

prove what is needed. The fact that many miners in the various states, without compensation, and often with a certain amount of expense to themselves, have taken advantage of the instruction offered by the Bureau of Mines, shows that we could count on them to do their part. The operator should also coöperate, for an available, well trained rescue corps, besides its value in case of explosion, might at times prevent disastrous mine fires.

It is true a number of our large operators maintain rescue apparatus with efficient corps of trained men. It cannot be expected, however, that the smaller mines will be thus provided. Even should an operation maintain such a corps, in the event of a serious explosion it would still need assistance from other sources.

In order to form and maintain such an organization, and to properly distribute the corps, the state should furnish the apparatus and provide the supplies for same; there also should be sufficient compensation to the members to maintain regular drills. New men could be trained at these drills who would be eligible to act as substitutes, thus keeping the corps always up to full strength.

The operator should necessarily coöperate by furnishing the station and place for drill, which need not be elaborate. He should also assume the responsibility for keeping the equipment in condition.

The pay which each member should receive for drill should be sufficient to attract the best men from the mine or mines where the corps was located.

The workings of the corps should be under the direct supervision of the chief inspector, who should lay out the general system of the work and receive reports of same from the several corps captains. He should also be empowered to call on any or all corps for any serious disaster within the state. In this way the inspector could have at hand in an emergency a sufficient number of thoroughly organized corps which could serve as units in rescue work.

Team Work Is Important

The question of team work is of great importance. It is recognized that the corps, and not the individual, must be the unit in rescue work, as no man should go alone, or even with one companion. Five members seem to make the most effective working force, since if one is overcome, or meets with accident, there are four left to bring him back.

No matter how many men may volunteer in emergency, organization is lacking; the men are strangers to each other, and naturally doubt the courage or judgment of others. The weakness of the individual then becomes the weakness of the whole corps. Also the particular apparatus worn is new to the volunteer. It is not the one he has tried and tested out in many drills in the smoke room, and he feels that it may show a defect at the critical time.

A Mine Rescue Team Organized under Tennessee Legislation

With proper organization on the other hand, there could be brought together in emergency, not a sufficient number of individuals, but a number of organized corps, each member having confidence in his apparatus and his associates.

We have considered thus far the subject only with reference to work with the oxygen apparatus. As a matter of fact this may be, and often is, a small part of the question. The restoring of ventilation, building temporary brattices, and opening up a passage where falls have occurred must necessarily be done, and can probably be best accomplished by a volunteer force from our mines. Here, too, the question of organization is all-important, for there must be no haphazard work to add special danger to that which already exists.

While every disaster forms its own problem, the official rescue corps could, besides their drill in the appa-

ratus, be instructed in the general principles involved, and the dangers to be avoided. Men with this training might often do extremely valuable service in emergency.

Such a plan as I have attempted to outline would, if carefully carried out, result in an efficient organization, economical in administration, and well distributed through the mining districts. It should contain picked men from all sections, whose everyday work in the mines would tend to keep them in the best of physical condition.

Rescue Legislation in Tennessee

Last year the State of Tennessee enacted legislation with the object of bringing about as far as possible such an organization. This bill provided for the maintenance of a limited number of such volunteer corps, where an operator, or combination of operators, would furnish the apparatus, place for drill, and the necessary number of qualified men could be found to constitute a unit.

The bill set forth in detail the minimum amount of apparatus and the requirements of the operator, the qualification of men forming the corps, the requirements of a monthly drill, and the amount paid by the state to the operator for the materials used and to the members for drilling. No restrictions were placed on the private use of apparatus or corps, the only obligation imposed being the standard to which the apparatus should be maintained, and the monthly drill, together with the agreement to respond to a call from the chief inspector in case of a mine disaster, and to report with apparatus at any point in the state.

The obligation called for reporting for duty only, the actual entrance into danger being voluntary. Provisions were also made, giving the inspector authority at such occasions, with power to draw on the general rescue fund for necessary expenses, also for the compensation and expense of regular corps or specially qualified volunteers in case of a disaster. Provisions were likewise made for the employment of men for organizing and training in both rescue and first-aid work.

A station formed under this law directly after its passage, has shown that in detail it will give very satisfactory results. The unusual depression in the coal business in Tennessee since this bill was passed, together with the fact that much of the state's coal is produced in small independent mines, has been responsible for less being done in this work, thus far, than could be desired.

Suggestion for First-Aid Work

Rescue work and first aid are usually considered to have a more or less intimate connection. Rescue training should include the principles of first aid, although the latter as such does not necessitate any knowledge of rescue work.

In practice in rescue work the corps or team is the unit, while with first aid, although the training and drill are by team, the actual practice is usually by the individual.

While some legislation seems advisable in order to perfect organization in rescue work, little necessity exists for same in first aid, although each mine should be required by law to keep on hand suitable first-aid supplies.

The object of first aid is to teach the miner to be able to care for an injured man in the best manner possible until the arrival of medical assistance. While a miner will always do what he can for an injured comrade, it takes a greater incentive than the mere desire to be qualified for such an occasion, to induce him to learn this work.

While present methods have been successful in creating an interest in first aid, it does not seem to have entirely reached the desired end. To be the winning team on a field day seems to be a most powerful incentive, and tends to develop a group of a limited few, trained to a high degree of efficiency. While at a field day there are one- and two-man events, these are participated in only by picked men, and the members of a well organized corps are trained to work together.

When an accident actually occurs in the mines it is only by chance that a single member of the team is present, while the possibility is extremely remote that the whole team would be on hand to work as a unit. What usually happens is that those present do the best they can until the arrival of a first-aid man, who with such help as he can get cares for the injured miner. Often, as in the case of arterial bleeding, or electric shock, quick attention is required and there is no time to hunt up a first-aid man.

Contests Should Approximate Actual Circumstances

While it is hardly possible to have every man efficient in first aid, a more general acquaintance with the fundamental principles of this work would be lighly desirable

To hold the interest in this work the highly organized and efficiently trained team appears to be necessary, but it seems that our field days could be so arranged as to increase the general interest among the rank and file of our miners, and to represent more nearly the actual conditions under which accidents occur.

In local contests, where a considerable number of men from each mine could be present, in addition to the usual events, a simple one- or two-man event could be arranged, to be participated in by men chosen from among the general body of miners of each mine, outside of the first-aid teams; or, as in a real accident, one first-aid man could choose his necessary assistants from the miners at hand. A team event might be arranged for a single member of a corps, the remainder of the team to be picked at the time by a disinterested party, or in any other manner, from the miners present who are not members of a regular team.

While I do not know of any field days where such innovations have been tried, it may be possible that something along this line, while in no way detracting from the general interest in such occasions, might tend to stimulate a more thorough diffusion of the knowledge of first-aid principles.

Historical Mine Fires—A coal bed in Colorado has been burning for nearly a hundred years. In some of the Welsh coal mines there are fires that have been alive quite as long. Near Summit Hill, Penn., a fire has been burning in a body of anthracite for fifty-three years. It is still unquenched. Already it has detroyed coal to the value of $26,000,000. Almost as many millions have vanished in the same way in a fire in an Ohio coal bed that has lasted twenty-eight years. Near New Castle, Colo., the first white settlers observed smoke rising from a mountain plateau. At first they thought it came from an Indian encampment. But it continued week after week. Investigation proved that a seam of coal was burning. From the Indian traditions it appeared that this fire had been burning more than a century. At Carbondale, Penn., subterranean fires that have been burning for ten years have caused the earth's surface to subside.—"The Analyst."

Plant of the Borderland Coal Co.

SYNOPSIS—At this plant coal is mined in Kentucky and loaded on cars for market in West Virginia. At one operation a double bucket cableway is employed, while at a second plant, an apron conveyor transports the output of the mine across a river.

Mining coal in one state and loading it for shipment in another has its advantages and its disadvantages. The disadvantages are less when the state boundary is an imaginary line than when it is a physical barrier, like the river which the Borderland Coal Co. has to cross in getting its product from the mines to the railroad cars.

Tug Fork of Big Sandy River forms the boundary between Mingo County, West Virginia and Pike County, Kentucky, and the Norfolk & Western Ry. here runs along the West Virginia side. The Borderland coal property is on the Kentucky side and the product must be taken across the river for shipment.

The property includes 3300 acres, extending about two miles along the river and yielding coal from three workable seams. High in the hills, about 500 ft. above the river, is the Winifrede seam, available over about 25 per cent. of the acreage and averaging 6 ft. in thickness. About 130 ft. beneath this is the Miller's Creek seam, varying in thickness from 3½ to 4 ft. About 250 ft. lower still is the Thacker seam, 4 to 4½ ft. thick and available over about 75 per cent. of the property.

To get out this coal the company has installed two plants, No. 1 at Borderland station, 5 miles northward from Williamson, and No. 2 the newer operation a half mile farther north.

The main offices of the company are in Roanoke, Va. Edward L. Stone is president of the corporation, James P. Wood is vice-president and Ernest B. Fishburn is secretary-treasurer.

Operation is in charge of L. E. Armentrout, manager, who resides at Borderland and has been the "man behind the gun"—as distinguished from the "men behind the check book" at Roanoke—in the big job of developing the plants to their present efficiency. His burden of the past has been lightened by the recent advent of C. A. Jones as general superintendent, under whom are the two mine superintendents, J. O. Sinnott, at No. 1, and H. Martin at No. 2. For the upper and middle seam workings at No. 2 Supt. Martin has J. R. Roach and Joseph Edwards, respectively, as mine foremen. The lower seam workings are new, and neither the middle nor lower seams are yet being mined extensively at No. 1 operation.

The Borderland Coal Co. was formed in 1903 to open No. 1 mine in the Winifrede seam. The original plant was a modest affair, with a continuous bucket carrier across the river from the head house on the Kentucky side to a simple loading outfit at the railroad.

General View of No. 1 Plant of Borderland Coal Co.

The high quality of the product gained it an unexpectedly good market and the demands for greater tonnage could not be satisfied by the original carrier, so in 1908 the present two-bucket cableway was installed. Continued growth of the outlet possibilities led to the installation of the No. 2 plant in 1910, equipped to work all three seams, and delivering the coal across the river by a long apron conveyor.

A Fine Domestic Coal Is Produced

Borderland Block is the coal by which the company is best known, as under this trade name the 5-in. lump goes to a high-grade domestic market through the central and northwestern states.

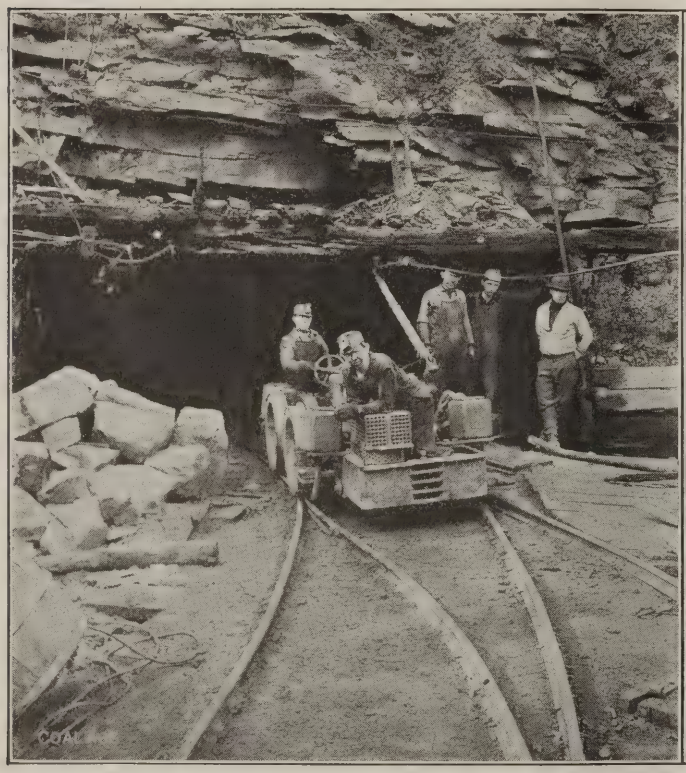
At No. 1 the railroad takes nearly all the coal smaller than 5-in. lump, using about 10,000 tons per month, so that little other than Borderland Block is shipped from this plant.

All coal passing through the 5-in. screens at No. 2, and all over railroad requirements at No. 1, are washed and separated into egg, nut and slack. The egg is shipped as a domestic and steam fuel, while the nut and slack go as steam coal for the stoker-fired boiler plants of several electric railways and paper mills. These are ideal consumers, requiring a fairly constant tonnage at all times.

The product is sold through the Borderland Coal Sales Co., Union Trust Building, Cincinnati, this separate corporation having been organized in 1911 for more effective marketing of the output than had been possible through general sales companies. The Edwards & Bradford Lumber Co., Sioux City, Ia., is agent for the Northwest.

It should be here noted that the Borderland Coal Co. is a Virginia corporation, mining coal in Kentucky, loading it in West Virginia, and shipping it to Ohio and beyond.

The cableway, at No. 1, with its two 4-ton buckets, gives a capacity of 1000 tons per day, and the other equipment is arranged accordingly.



The coal as brought across the river is dropped into a receiving hopper, from which it is passed over 5-in. screens. All going over the screens is loaded as Borderland Block; what passes through goes either direct to the locomotive coaling bins or to the washer plant for cleaning and preparation for shipment in any desired grades.

The locomotive fuel passes a continuous weighing apparatus at the receiving end of the long inclined apron conveyor to the bins over the railroad tracks. The latter has a capacity of 750 tons, with chutes for coaling locomotives on four tracks. All Norfolk & Western freight and coal trains stop here for fuel, as do also some of the through passenger trains. The railroad operates the coaling plant with its own men and pays the Borderland company a tonnage rate for all coal weighed onto the conveyor.

The complete locomotive fueling plant, as also the washer and screen equipment, was furnished by the Jeffrey Manufacturing Co.

Electric Power and Mining

In the early days the plant was practically without power. The original cableway operated by gravity (as does also the present one), the mining was by hand and the haulage by mules and gravity plane. When the capacity was increased in 1908 the mine was electrified; solid shooting was abolished and the mules banished.

Mouth of No. 1 Mine, with Goodman 6-Ton Single-Motor Haulage Locomotive

Looking Back Toward the No. 1 Plant from Mine Side of River

The power-plant equipment includes two Atlas horizontal tubular boilers, furnishing steam for two 100-kw. direct-connected right- and left-hand units. Each unit consists of a Skinner engine and a Goodman generator. Between them is a double switchboard. The entire power-plant equipment being furnished by the Goodman Manufacturing Co.

Only One Seam Is Now Worked

Only the top, or Winifrede seam, is as yet being worked at No. 1. The coal is undercut by five Jeffrey breast machines.

Gathering, the distribution of empties and making up trips of loads, is done by Goodman 3-ton single-motor locomotives of the "1600" type. There are five of these machines at this mine, four regularly at work and a fifth on spare. Two 6-ton single-motor locomotives of the

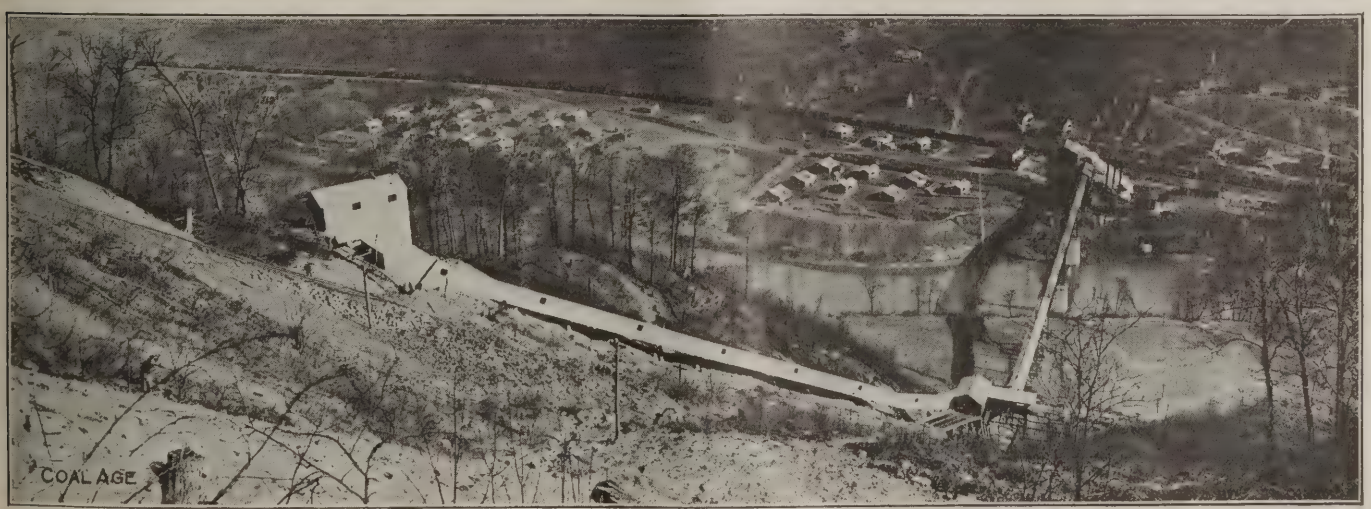
same make do the main haulage work between partings inside and the head of the gravity plane outside.

The head house where mine cars are dumped and the cableway buckets loaded is at the level of the middle seam, so that this coal can be handled through it when that seam is opened. The top seam opening is located some distance around the mountain. A short haul from the drift mouth at the level of the top seam brings the mine cars to the head of a 30-degree gravity plane, 350 ft. long, down which they are lowered to the main roadway at the middle seam level, where an 8-ton Porter steam locomotive hauls them around to the cableway head house, a distance of 3400 ft.

Goodwin Gathering Locomotives and Short-Wall Mining Machine on Entry

No. 2 Plant Works All Three Coal Beds

Started in 1910, the plant at No. 2 has only within the present year been completed for working all three seams. Still further growth is in prospect when the contemplated building of a railroad along the Kentucky shore of the river makes it feasible to install independent plants, at both operations, for separate preparation and shipment of coal from the lower seam, which differs materially in character from the quite similar coals of the top and middle beds. At present the lower-seam workings at No. 2 are just started and their small production is mixed with the larger tonnages from above.



There being no locomotive fueling equipment at No. 2, the preparation plant for small coal is of greater size and importance than at No. 1, and furthermore it is continuously operated. The washer and screening equipment is all steam driven, as is also the long apron conveyor by means of which the coal is brought across the river.

This conveyor is 950 ft. in length and was, when new, the longest of its kind ever installed. Its inclined portion—222 ft. long and on a slope of 19 degrees—has a gravity effect such that only 5 hp. is required for operating the entire apron, with full load, in cold weather. In warm weather, and with good lubrication, on the other hand this conveyor will run without power consumption.

Whereas at No. 1 plant there is a suspension bridge across the river, at No. 2 the conveyor framing includes a travelingway beneath the conveyor proper, which together with the coal-preparation machinery was furnished by the Jeffrey Manufacturing Co.

On the mine side of the river everything is electrically operated, driven from the power house on the railroad side. This power house is a duplicate of that at No. 1, except that there are three boilers, one extra being necessary to drive the steam engines operating the washing and screening machinery.

The two generator units are identical with those at No. 1, having 100-kw. Goodman generators directly

Showing Lengthy Conveyor System at No. 2 Mine

coupled right and left to Skinner engines and delivering current for distribution at 250 volts from a switchboard placed near the wall between the two generators.

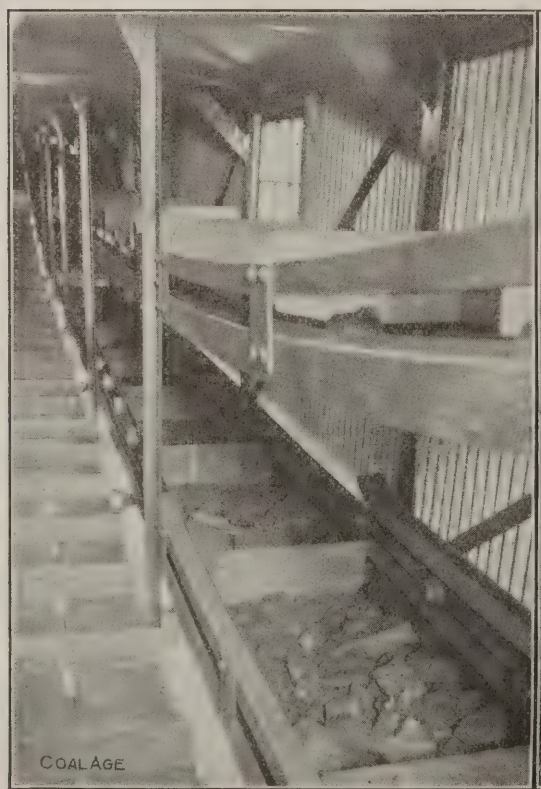
The output of this plant is practically all used on the mine side of the river, mainly in coal mining and haulage.

The head of the apron conveyor crossing the river is at the level of the lower seam. The hopper from which it is fed receives the coal from all three measures—only temporarily, however, from the lower one. The lower-seam cars dump directly to the hopper. The middle-seam coal is received from a retarding flight conveyor, recently installed by the Webster Manufacturing Co. while the upper-seam coal is brought down in 6-ton monitors on a gravity plane 650 ft. long.

Mining the Upper Seam

The upper, or Winifrede seam, was here first opened in 1910. The coal runs about 6 ft. high and of the same fine quality as at No. 1. The mining conditions are exceptionally good, with firm sandstone top and clean bottom. The coal is all cut by shortwall mining machines, there being three in use at present, two Goodman and one Sullivan.

Three Goodman 3-ton "1600" locomotives, with mechanically driven electric cable reels, do the gathering; while for haulage there are two Goodman 6-ton, "2600" locomotives, one doing all the work of present production, with the other on spare. Cars of 2 tons capacity are used, on 48-in. track gage.



Both the other mines are in the early development stage. The lower seam was entered in 1912 but has not been carried beyond a few cars of production daily. Middle-seam work was begun in 1913 and has been pushed for rapid development, so it is already far in advance of the lower mine.

At first, until the retarding conveyor was installed, the middle-seam cars were hauled up the hillside to the higher level, where they were dumped like those from the upper seam. The conveyor now lets the coal down to the lower mine level, where it goes to the same hopper into which the monitors discharge, and which feeds the apron conveyor extending across the river.

Power House and Preparation Plant at No. 2 Mine

The retarding conveyor is of the flight type, and is fed by an apron conveyor beneath the hopper to which the middle-seam mine cars dump. It is 440 ft. long and

Looking Upward through the Conveyor House

Showing the Conveyor System as it Spans the River

is controlled by an electric motor, through worm gearing. Conveyor and feeder are geared together and operate as one, while the gravity action is such that the worm drive is in reality a locking device to prevent the conveyor from running away. The motor has only to rotate the worm and allow the conveyor to drive itself and its feeder.

The middle seam being thinner, smaller mine cars are used. At the lower seam, however, the cars are the same as for the top seam. Track gages and operative equipment are maintained the same for all three seams, giving advantageous interchangeability of both equipment and spare parts.

The shortwall type of mining machine is of even greater value in these thinner coals than in the thicker top seam. There is only one Goodman machine in the lower mine, while three are employed in the more rapidly developing middle measure. Thus there is a total of seven shortwall machines at No. 2 mine.

Gathering and haulage in both mines are accomplished by 3-ton locomotives. There are two of these machines at the middle mine and one at the lower.

There are, therefore, at No. 2 mine two 6-ton "2600" type and six of the 3-ton "1600" type, all of Goodman manufacture.

The Labor Situation

SYNOPSIS—The Industrial Workers of the World are rioting in Belmont and Jefferson Counties of the State of Ohio, while the United Mine Workers of America actively oppose their propaganda of violence. In Oklahoma, it seems as if the union is itself responsible for the destruction of tipples by dynamite and fire. The Kanawha settlement being finally completed, the union purposes to extend the organization into the competitive Guyandotte Valley, where low wages rule. A meeting has been held by Socialists in New York City, urging the operation of the Colorado mines by the Government.

No progress has been made toward a settlement of the strike in eastern Ohio and meanwhile rioting is becoming general. The violence seems not to be chargeable to the Union, at least as a body, but to the Industrial Workers of the World, because the local mine workers' officials at Bellaire, in Belmont County, have announced that after the present trouble is settled the miners who have participated in the disturbances of the Industrial Workers of the World will not be permitted to return to work as members of the Union and will be put out of the organization. The efforts of an Italian organizer of the U. M. W. of A. from the Colorado field have failed to pacify his fellow countrymen who are members of the Industrial Workers of the World. It is said that owing to their staunch adherence to law and order the miners' officials' lives have been threatened.

On July 15, 200 miners picketed the mine of the Fort Pitt Coal Co., near Bellaire, and prevented the company from carrying out its intention of starting the pumps and fans to clear the mine of water and foul air. Sheriff J. H. Anderson stated that he was unable to give the mine protection because the citizens refused to serve as deputies.

SHERIFF TAKES TARDY ACTION

The operators, prominently among them being the Lorain Coal & Dock Co., are still demanding of Governor Cox that he give them the protection of the militia, but he still insists that the sheriffs should prevent disorder. Major Harold Bush of the Ohio National Guard has spent several days investigating conditions in Belmont County as a confidential agent of the Governor. He reports that the sheriffs' powers are fully able to meet the situation. Governor Cox reprimanded the sheriff of Belmont County for not making more vigorous efforts to suppress rioting, pointing out that despite the fact that there had been a week's disorder not one arrest had been made. Finally the sheriff drafted 50 men and arrested 5 I. W. W. rioters who were attacking caretakers and engineers at a mine near Stewartsville. They were lodged in jail at St. Clairsville.

DISORDER SPREADS TO JEFFERSON COUNTY

But the worst disorder occurred in the neighboring county of Jefferson, which lies to the north of Belmont County. Here at Bradley, there was a spirited encounter between about 100 deputies and double that number of I. W. Ws. following an attempt to arrest ringleaders of the organization charged with riotous conduct.

Two or three hundred strikers kept their promise to Sheriff Huscroft and marched down from the hills intending to drive out the pumpmen from the Dillondale and Rush Run mines of the United States Coal Co., near Bradley, O. Huscroft and his party met them and drove them back, arresting several. Bricks and stones were used by the rioters and Deputy Edward Lucas was severely injured. It is further stated that the sheriff and three deputies were struck with clubs. The miners retreated to their houses and a number of shots were exchanged. The women were used as shields by the I. W. Ws. They used both clubs and stones and threw pepper and salt into the eyes of the deputies.

A number of operators with headquarters at Cleveland, O., signed a communication to the governor on behalf of practically all the eastern Ohio operators to the effect that they have complied with their agreement with the miners' union and have not laid off any Union pumpers and engineers at the mines. He had asked for information as to this fact, John Moore, the state president, having declared that nonunion men were replacing members of the organization in pump and repair work.

IMPURITY AND SLACK MAXIMA DELAY SETTLEMENT

Arrangements have been made for holding conferences of operators in the Hocking Valley and Jackson subdistricts, July 20; in Crooksville and Lawrence County, July 23, and in Pomeroy and Massillon, July 27. These conferences are for the purpose of agreeing on working conditions and the rate for day work and also to try to arrive at an adjustment of the percentage of impurities and fine coal to be allowable under the new mine-run law.

It was believed for a time that work could be resumed July 20, but when that time approached it was found to be out of the question. Much new ground is to be covered in the negotiations and consequently more time was required than at previous agreements. Work is expected to be resumed in all the districts which have signed the scale by Aug. 1, if not earlier.

UNION VIOLENCE IN ARKANSAS

The situation has become more severe and the Union may be as blameable in Arkansas as it is commendable in Ohio. On July 17, fire and dynamite were used to destroy 4 tipples, 2 fanhouses, a store and boarding house of the Mammoth Vein Coal Mining Co. at Prairie Creek, Ark. Some mine guards were killed and some are missing. How many men have been killed was at the time of writing uncertain, but the bodies of John Baskin and Clarence Stylesberry have been found and the coroner was holding an inquest over their bodies. According to the affidavit of L. C. Thomas, also a mine guard, and a participant in the fight, he and six other guards left the mine when the fighting was at its height and tried to break through the attacking party.

They were captured and removed to a log house in the woods and held for hours till the state officers arrived. Then it was that one of the Union men shot Baskin and as he fell fired at Stylesberry, sending another bullet in the body as the latter tumbled over.

Eight warrants have been issued by Federal Judge Youmans charging violation of the court injunction. The sheriff of Sebastian County, Lon Norris, and Paul Little, the attorney for the state, are investigating the battle.

Twice recently the mining camp of Frogtown, near Prairie Creek, was shot up and it is reported that another attack was made on the 16th. The wires being down, news is difficult to obtain. The property loss is estimated at $200,000.

As a result ten men have been arrested for inciting a riot and warrants have been issued for twenty more. Seven men in addition who were employed at No. 4 and are said to have engaged in the fight have been arrested charged with a breach of the peace.

The Coronado mine, also belonging to the Bache-Denman Coal Co. and located a mile west of Huntingdon was dynamited and completely destroyed on July 20. Thus in less than a week this corporation has lost the Mammoth Vein mines, mines Nos. 3 and 4 and the Coronado plant.

KANAWHA STRIKE ENDED

It seems permissible at last to record that the Kanawha strike in West Virginia is at an end. On July 15, by a vote of 4 to 1, the delegate convention of the United Mine Workers of America, No. 17, voted to accept the proposition tentatively agreed upon by the miners' representatives and the Kanawha Coal Operators' Association. Every clause was submitted to vote separately.

The contract provides for the check-off, which was first granted in 1903 and surrendered in 1906; for a wage scale for outside workers; for the extension of the 1912-1914 Kanawha wage scale and for the elimination of the discrimination clause. Every clause was carried by a substantial majority and no amendments were made. If the union men are opposed to the check-off, as was alleged by the operators, that fact did not show in the voting, as 43 voted for it and 3 against it.

The hand pillar-drawing rate in the gas seam has been left to local adjustment. It must not, however, be less than 40c. per ton. In the splint seam, the same rate has been left to local determination and must not be less than 46c. It has hitherto been 56½c. per ton. In some places this coal is much easier to mine than it is in others and this fact is expected to operate in the adjustment of the scale. The docking rate for dirty coal is reduced from $1 to 50c. for the the second offense.

OTHER DISPUTES IN KANAWHA FIELD

The miners claim a victory in securing the check-off and the operators are successful in getting a 3-year settlement. About 200 miners are on strike at the Montgomery and Eureka mines on Morris Creek; and the Winifrede and Belmont mines of the Winifrede Coal Co. are idle owing, it is said, to a lockout, but the lack of orders may be the cause of the idleness.

No contract has yet been signed with the Four States Coal Co. at Dorothy, or with the Milburn Coal Co. on Paint Creek, but the miners are working at both operations pending an agreement.

THE GUYANDOTTE VALLEY TO BE UNIONIZED

A scale being arranged on the Kanawha, the union officials will turn their attention to the unionizing of the Guyandotte valley plants in Logan County. The Guyandotte, it will be remembered, enters the Ohio a few miles above Huntington and runs on a course roughly parallel to the Kanawha except at its headwaters in Wyoming and Raleigh counties. At present only about 3000 to 5000 men are employed, but it is expected that before long 10,000 men will be engaged. The companies operating are still small except the United States Coal and Oil Co. at Holden, W. Va., and the Monitor Coal & Coke Co. Island Creek No. 1 of the former company produced the second largest tonnage of any mine in West Virginia in 1912.

So far the success of the union in West Virginia has been with the smaller companies. It is now purposing to pit itself against a company of financial strength. The mines of the United States Coal & Oil Co. are in the No. 2 Gas seam, as are most of those in the Kanawha valley, and the company has been a strong competitor of the Kanawha operators, as its rates are lower than those paid by them, its mines being run on a nonunion basis.

FEDERALIZING COLORADO MINES

Probably some will be disposed to lay much emphasis on the meeting held in Webster Hall, July 17, to protest against the coal companies in Colorado and to demand the acquirement of all the mines by the federal government and their operation by the United States or by lease under severe restrictions. As a matter of fact, there is in the meeting no new menace to capital. The parties who advocated the action were all recognized Socialists except a few who kept well in the background and did not speak at the meeting. In fact, there was a general note of apology for so mild a resolution and almost everyone who spoke wished to explain that for years he had believed in state ownership undiluted for all public utiliies, and some were evidently uninclined to stop at the acquiring of the establishments of public service corporations and desired to enjoy the parlous pleasures of unmitigated state socialism.

Dudley Field Malone, collector of the port of New York, who was said to be on the committee, did not attend, so the federal administration was in no way represented. Benjamin C. Marsh presided and he read Amos Pinchot's attack on the Colorado Fuel & Iron Co., a somewhat conservative statement in which he declared that according to the admissions of the company officials that corporation had been slow in complying with the Colorado State laws which evidently they regarded as class legislation. He did not declare that they were now violating the laws of Colorado.

Hugh Frayne, New York representative of the American Federation of Labor, then spoke, stating that John D. Rockefeller by a word could have prevented the bloodshed in Colorado. We much doubt if he could have done so permanently, but whether property owners are to listen to the cry to prevent bloodshed by surrendering when the malcontents break the peace is a question to be determined when all the facts are known.

There is something childish in Frayne's statement. There were other ways of avoiding bloodshed. Certain Greeks and Bulgarians, for instance, could have given up their guns and permitted those men who would, to go to work without improper interference. Had the Colorado union officials behaved as well as the mine leaders in Ohio, there might have been no Ludlow.

JOHN W. BROWN AND MOTHER JONES

Then followed the interesting Meyer London, who has a congressional position in mind. John W. Brown, one of the leaders of the miners in Colorado, made a mild address on the economic condition in the mines of the state. He got not a little applause, but only because he made a few purely socialistic statements. Mother Jones' witticisms' and sallies were loudly applauded, as also her stories about her dogged obstinacy and her determination to go back to Colorado "next week" and make trouble.

She said she came to talk about the "babies" who were roasted by the operators and whom she knew and had learned to love on her previous visit. All this "sob talk" utterly failed to create an impression, because it did not concern socialism; beside it was all untrue and the people knew it. The story of the father going back to the militia camp for his boy who had been missing and having the boy's headless, half-burned body thrown over to him with the words, "Here, take the damned thing," was not even told, and had it been told would not have been believed. Mother Jones stormed at those present because they had not started a revolution to avenge the wrongs of the "babies," but reiterating the word "babies" did no good. Let no one think that any body of citizens believes the babies were deliberately burned. Only those will credit the militia or operators with it who are capable of doing it themselves and there were probably none in the audience who could be conceived as ever being engaged in such villainy.

Senator Martine was fairly well received, though those of our readers who have heard him and his moss-grown oratory will hardly credit the statement. He talked mainly on himself, his beliefs and services, and on the West Virginia situation. He declared he had believed in public ownership of utilities for forty years. Like everyone else, he showed that he did not believe that the action called for was one arising out of the pecular conditions in Colorado.

WHY ARE COLORADO MINES CHOSEN FOR SOCIAL EXPERIMENTS?

The motion was finally put, but Marsh had to explain that it had been hard to agree on the nature of the resolution. It was clear that some objected to it because, as they would express it, it would "only replace a soulless corporation by a soulless government." Besides, others objected because there was an inference that the government would pay for what it took. Do not the Socialists rather desire to tax the value out of all property before annexing those properties for the public? Also, was Socialism not asking for a small part only of what all the Socialists desired in far greater measure? Hence Marsh thought it necessary to apologize for the half-hearted resolution. The voting was strongly in favor of the motion, though it was not enthusiastic for the reasons given.

The audience was a respectable working-class assemblage. The men and women were of a self-respecting kind, mostly English-speaking foreigners, all orderly and above the average of citizenship. It is a pity that to such an audience a reasonable argument could not be presented such as would convince them of the essential soundness of a less radical program and would assure them that at present real social self-immolation is so rare among workers and capitalists that it is not safe to base our civilization on its existence.

Electricity in Coal Mining

By David R. Shearer*

SYNOPSIS—This is the last article of the series on this subject and treats of the application of electricity to purposes of mine ventilation and drainage. The centrifugal pump, on account of its high operating speed, is admirably adapted to direct connection to a motor shaft.

It has been necessary since almost the earliest developments in coal mining to use some type of device for securing a circulation of air throughout the different parts of the mine. Since both men and animals are working underground in comparatively restricted quarters, the oxygen would soon be consumed from the air and replaced by gases dangerous to health and life, even if gas were not constantly escaping from the coal in many mines.

The earliest systems of mine ventilation were based on the principle of chimney suction. Tall stacks were built from which an air duct led into the mine so that when fires were kept burning in the chimney a continual draft of air was being sucked out of the workings and carried up the chimney.

This method was necessarily both cumbersome and expensive and was soon replaced by large fans and blowers driven by steam engines or some other form of power. If steam engines were used and the fan located at a distance from the boiler, large losses from condensation occurred in the steam pipes. The normally low speed of the steam engine made necessary the use of very large fan wheels, which called for expensive housings and heavy foundations.

Upon the advent of electrical power for mine operation the electric fan rapidly came to the front, and at the present time it is used almost exclusively where current is available. Electrically driven fans are of many different forms and operated by various types of motors connected in some cases by belts, chains or gearing or more usually mounted on the motor shafts.

When a ventilating fan is of such design that it may be mounted in this manner a high efficiency is secured with practically no noise and very smooth operation. Since a fan must be operated continuously a small gain in economy means a considerable saving in power consumption, and since even a short stoppage of the fan would result in danger to those working in the mine, it is necessary to have the very best driving equipment possible.

The direct-connected motor meets these conditions admirably, for not only is it economical, but subject to little danger from accident or wear. The motor-driven fan being usually run at high speed is compact and easily moved when necessary. When a change of location is found to be desirable, the feed wires may be quickly taken down and erected at a different point.

If electric power is available and a fan be subjected to some accident, it is possible to install temporary equipment quickly, fed from the distributing lines to take the place of the disabled machine.

Where alternating current is available, perhaps no better method of driving a fan may be found than the use of a squirrel-cage induction motor, since these machines have no open contacts, no sliding brushes or commutator and consist of only two parts, the rotor or rotating member and the stator or machine frame, upon which the windings are placed. Such a motor will operate continuously and economically with practically no attention except an occasional oiling. Direct-current motors, however, are quite satisfactory in several types when alternating current is not available.

*Schaum & Uhlinger, Philadelphia, Penn.

Pumps Also Have Hard, Rough Usage

Another class of mining machinery upon which devolves hard service is the mine pump. Pumps are placed in service for two purposes, to supply water to the boilers or for domestic use and to pump out the water accumulating in the lower levels of the mine.

Many different types of pumps are found in common use, the geared single-action, duplex, triplex and multiplex, centrifugal and positive rotary. Each of these types has certain advantageous points for working under certain conditions, and it may be necessary to use several types in one mine to meet the varying requirements. Probably the most satisfactory pump for domestic and boiler service is the plunger type, either simplex or duplex, operated through spur gearing by an electric motor.

Here again the induction motor makes an excellent driving power, since it operates smoothly and with practically no attention. This machine is less affected by dampness than any other type and cases have been known where a squirrel-cage motor continued to operate after being submerged by several feet of water for five days, or until it had pumped all the water out of the shaft in which it was located, and this without injury either to the motor or to the pump.

It is possible to use a motor on a small pump that may be thrown directly across the line without injury, but those of a larger size require some form of starting device. This may be either hand operated or entirely automatic. Thus, a pump may be located at a long distance from the power house and yet be readily controlled from this point.

In the case of domestic water supply the operation of the pump may be made entirely automatic by a float-switch mechanism, so that when the water drops to a certain level in the tank, the motor is automatically started and pumps until the tank is filled to a predetermined point where the float throws out the switch and stops the pump. Frequently an arrangement of this kind is used in the lowest level of the underground workings, so that when water rises in the sump to a given point, the motor begins work and pumps the water out without any attention whatever.

Piston Pumps Are Subject to Rapid Wear

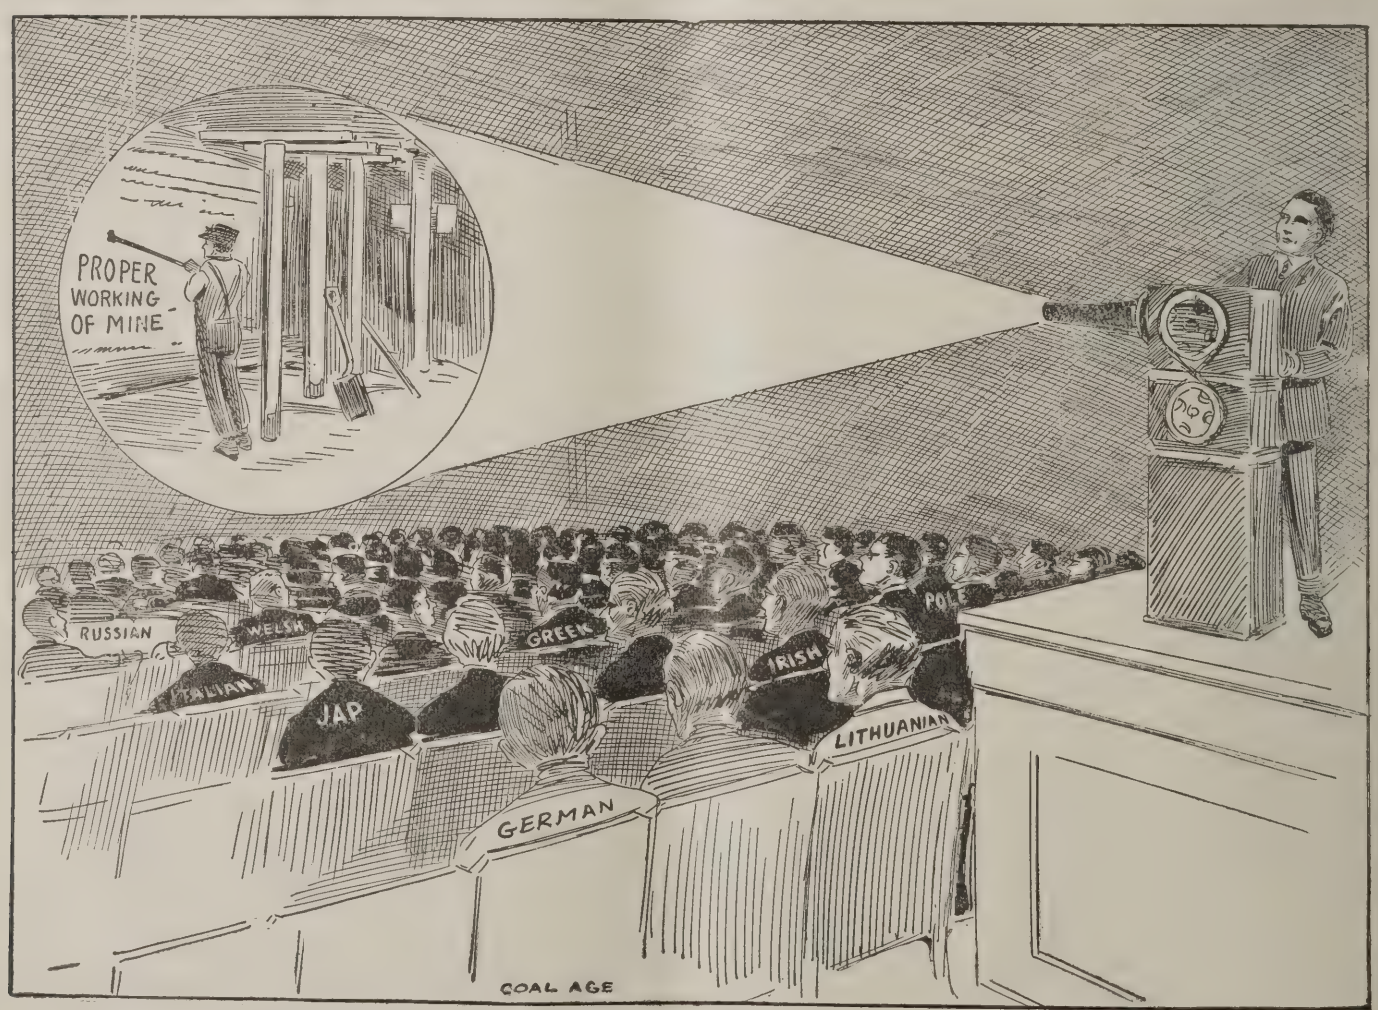
Although the piston pumps are quite efficient in handling water, they are subject to rapid wear from mud or grit and frequently a few months' operation either wears out the valves or cuts the cylinder so badly that a new pump is made necessary. To obviate these troubles, many types of centrifugal pumps have been brought out in which there are no valves and no sliding surfaces exposed to the gritty water.

The principle of operation in these pumps is as follows:

The pump casing being full of water, the impeller in rapid motion tends to throw the water outward by centrifugal force and as the only outlet is the delivery pipe at some point in the circumference of the casing, the water is forced out through this opening with considerable velocity and is replaced by suction with more water admitted to the center of the impeller.

One marked advantage in this type of pump is that owing to a high speed being necessary, they may be connected directly to an electric-motor shaft without intermediate belting or gearing. Many of these pumps are mounted direct on the motor base so that the whole forms a self-contained unit and may be moved from place to place readily.

Peculiar Feature of Centrifugal Pump



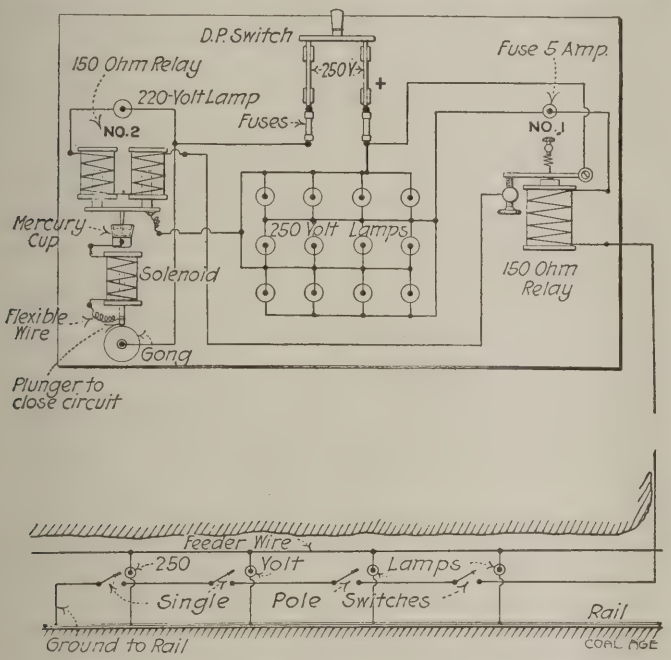
A peculiar feature of the centrifugal pump and one that is directly opposite to that which exists in the piston or plunger type, is that when the discharge pipe gate-valve is closed, the pump impeller runs light and without taking excessive power, but as soon as this valve is opened, the pump assumes a load. If the gate valve were closed on a plunger pump when it was running, either the pipe or pump would be broken or the driving power would be stalled, since such a pump is positive in action.

Another type of pump used to some extent where pure water is to be forced from one level to another is the positive rotary pump, which usually consists of some form of gearing or wheels which mesh together in such a manner as to create a suction in one side of the casing and a pressure in the other. This type of pump runs at a higher speed than the piston pump, but lower than the centrifugal and is not employed to any great extent in mine work.

As a usual thing, it is advisable to use a motor about twice the size theoretically necessary to drive a given pump, since considerable losses occur both in the pump proper and the pipe lines. If the pump is of the piston type driven by intermediate gearing, considerable power is lost in the transmission, so it is best to dispense with all gearing except that absolutely required.

The theoretical power necessary for pumping purposes may be found as follows: Multiply the height of head in feet by the number of gallons to be moved per minute and this product by $8\frac{1}{3}$, dividing by 33,000. This gives the theoretical horsepower, which should be multiplied by 2, in order to find the size of motor necessary.

The Summer Meeting of the Pennsylvania Anthracite Section of the A. I. M. E. will be held this evening (Saturday, July 25, 1914), at 7.30 p.m., following an informal dinner at the Pottsville Club, Pottsville, Penn. William G. Whildin, mining superintendent of the Lehigh Coal & Navigation Co., will present a paper on "Steep Pitch Mining of Thick Veins," and informal discussion of the paper is invited. Charles Enzian is secretary.



The Universal Language That Gives Impetus to the "Safety-First" Movement in Coal Mining

A Good Signal System

By James McCune*

For the benefit it may be to others operating under similar conditions, I submit the accompanying diagram of a wiring system that I installed, several years ago, in a mine in the Birmingham district, in this state. Although the mine is not working at the present time, the signal system to which I refer worked satisfactorily for two years previous to shutting down the mine. To my knowledge, the system never gave the least trouble in its operation, during that time.

I will attempt to describe the system as clearly as possible. The switchboard, which was located on the surface, was designed so that the signal gong could be rung by opening any one of the single-pole switches, which were located about 100 or 150 ft. apart along the haulage road

An Automatic Danger Signaling Device for Mines

in the mine, as shown in the diagram. I used a single wire, No. 14, B. & S. In order to use the 250-volt power circuit, for this purpose, twelve 250-volt, 16-cp. lamps, in series parallel, were cut into the circuit to reduce the line pressure to about 20 volts with a current of 3 amperes. This current was conducted through the 150-ohm relay No. 1, as shown in the diagram, from whence it passed into the mine.

As long as the mine circuit remained unbroken, No. 1 relay being in the circuit was active and permitted the current to pass likewise through the branch circuit that energized No. 2 relay, shown on the left of the diagram. This relay (No. 2) being thus active held the needle suspended above the cup of mercury, thus keeping open the circuit for operating the signal gongs.

If, now, the mine circuit was broken by the opening of any one of the single-pole switches in the mine, or by an accidental fall of roof, or other cause, No. 1 relay was at once rendered inactive and the branch circuit was thereby instantly broken which, in turn, rendered No. 2 relay inactive and permitted the needle to drop into the mercury cup. This closed the circuit passing through the gong, which was thus thrown into action and continued to ring until the main circuit was again closed, when it would cease.

The operation of the secondary circuit to ring the gong continuously is well understood. The gong is rung by the plunger striking against it whenever the solenoid is inactive; but the instant the plunger touches the gong, the circuit is again complete and the plunger is drawn back into the solenoid, which again breaks the circuit and again the plunger strikes the gong. The action is thus an alternate making and breaking of the secondary circuit, which produces a continuous ringing of the gong as long as this circuit is closed.

When this system was first installed, I expected that some trouble would arise from the excessive heating of the relay coils, but this fear was not realized. As an extra precaution, an incandescent lamp was introduced into the circuit above relay No. 2 and served to show, by its burning, that the main circuit was unbroken. Lamps were also introduced into the main circuit at each switch in the mine, and these served both to light the roads and to locate the switches.

*Yolande, Ala.

Kansas Mines More Coal

The coal miners of Kansas, according to E. W. Parker, of the U. S. Geological Survey, working in coöperation with the Geological Survey of Kansas, produced 7,202,210 short tons in 1913, valued at $12,036,292. This was a substantial increase over 1912, especially in the value of the output, which advanced more than 6 per cent. The production of the former year was 6,986,182 short tons, valued at $11,324,130.

The coal-mine operators of Kansas had little of which to complain during the year. There was no serious trouble with labor, railroad consumption increased somewhat on account of the strike in Colorado mines, transportation facilities were satisfactory, and the demand for steam coal, for manufacturing and domestic fuel generally was well up to the supply. The only unfortunate incidents were occasional shut-downs, at the stripping operations, because of high water in the spring, and some inconvenience during the summer and early fall when boiler water had to be hauled. Shooting from the solid continues to be practiced in the coal mines of Kansas.

It Is Important

That you should read the "Extracts from a Superintendent's Diary," published in Coal Age each week. This brief article contains a lot of good common sense. One subscriber says: "It seems like a page from my own experiences." We also suggest that you carefully examine the next issue of Coal Age and read the following articles: Engineering Practice of the Consolidation Coal Co.; An Endless Rope System for an Inclined Plane; Sanitation and Simple Ways of Making It Effective at Coal Mines; Flameless Surface Combustion for Boiler Heating; Substitutes for Wood Timbering in Mines; Costs and Application of Piping at Coal Mines and a Description of a Particularly Well Executed Shaft-Plumbing Operation. There will also be several feature articles that will hold your closest attention, and one of the best poems Mr. Braley ever turned out. In short, the Aug. 1 number will be the most interesting issue of Coal Age ever printed.

Who's Who in Coal Mining

John Dunlop

One of the many ambitious men who have figured in the coal-mining industry, and who have given generously of their time and talents to the building up of that industry in Illinois is John Dunlop, former state mine inspector and, at present, inspector for the Safety-First Mine-Inspection Bureau of the Peoria district.

Mr. Dunlop was born at Annick Lodge, Parish of Irvine, Ayrshire, Scotland, 1864. Educated, at first, in the common schools of Scotland, he entered at an early age, Kilmarnock Academy. Mr. Dunlop early showed a deep interest in all that pertains to coal mining. He joined the classes which were at that time conducted as the Science and Art Department and under the administration of the Government. By his devotion to study and

JOHN DUNLOP

constant application, he received from those schools four diplomas. The instruction included a thorough course in mining engineering.

At the early age of 23 years, Mr. Dunlop came to the United States and located first at Clay City, Ind., where he remained for a few years before making Illinois his adopted state. In 1892 Mr. Dunlop took the examination for mine manager, before the State Mining Board and passed with high credit. The following year he secured the appointment of mine manager for the Pittenger & Davis Coal Co., Centralia, Ill., which position he held for five years.

Again, in 1897, Mr. Dunlop went before the State Examining Board and passed successfully the examination for state mine inspector, to which position he was appointed by Governor John R. Tanner, being assigned to the Sixth Inspection District of the state. He was reappointed, successively, by Governor Yates and Governor Chas. S. Deneen. In the year, 1908, Mr. Dunlop was employed by the Marion County Coal Co., to sink several shafts near Centralia. But, in 1909, he again entered the state inspection service and was assigned to the Third Inspection District, at which time he located in Peoria.

Effect of Change in Administration

Owing to a change in administration and the divorcement of the mine-inspection service in the state from civil-service control, all the state mine inspectors of Illinois, with one exception, failed of reappointment, Mr. Dunlop being among the number. This universal change in the inspectorate of the state was the result of a purely political upheaval. Mr. Dunlop's ambition would not permit him to remain idle, however, and his ability as a mine inspector and instructor in coal mining brought him the appointment of inspector for the Peoria District Safety-First Mine-Inspection Bureau. This is an organization made up of the following operators of that district: Crescent Coal Co., Clark Coal & Coke Co., Logan Coal Co., Groveland Coal Co., Tazewell Coal Co., Warsaw Coal Co., Newsam Bros. Coal Co., Brewster & Evans Coal Co., all in the Peoria district.

Since taking up this work, Mr. Dunlop has manifested his usual energy and made a thorough inspection of the mines of these companies. He has given much personal instruction to the men in the mine, whereby we may hope he has greatly reduced the liability to accident. Not satisfied with performing his duties as inspector of mines, Mr. Dunlop has organized and successfully conducted large classes in coal mining, in connection with and in addition to his other duties. That this work of instruction has been eminently successful goes without saying. Mr. Dunlop is a close student of mining and thoroughly acquainted with the theory as well as the practice of mining coal.

At the last meeting of the Mine Inspectors' Institute of the United States of America, Mr. Dunlop was chosen president of the Institute, of which he has been a member since its organization. This meeting was held June 9-12, at Pittsburgh, Penn. The next meeting (1915) will be held in St. Louis, Mo.

::

Marketing Waste Gas at Birmingham—A controversy developed between the city of Birmingham and the Birmingham Railway, Light & Power Co. over the proposal of the company to furnish byproduct gas to the city from the coke ovens of the Tennessee Coal, Iron & Railroad Co. Under the proposed contract the gas company would have furnished the gas at an average reduction of about 18c. a thousand to the city consumers, but the city officials stood out for a lower price on the ground that the gas was a waste product, and their stand has resulted in Birmingham failing to secure the cheaper gas. George Gordon Crawford, president of the Tennessee company says that between the coke ovens at Fairfield and the steel mills of the company at Ensley there is a 24-in. pipe line 2½ miles long connected to two compressor stations, one of 25,000,000 cu.ft. daily capacity and the other of 30,000,000 cu.ft. daily capacity. The gas is compressed and forced through the mains to Ensley, where it is used under boilers and in the open-hearth furnaces and soaking pits, displacing coal. The company has spent over $140,000 in piping this gas to its steel plant and could use to advantage several times the present quantity of gas in its plants.—"Wall Street Journal."

Editorials

The General Labor Strike

The British Columbia Labor Convention decided on July 15 to call a general strike of all the labor forces in British Columbia, because of conditions which have arisen out of the miners' strike on Vancouver Island. A referendum will be necesesary to make the decision effective, and this will prevent a strike for at least six weeks.

We shall overlook the fact in these remarks that such a strike would be against the laws of British Columbia, where both strikes and lockouts are regulated, but as this foolish European method of settling a dispute may eventually be imported into the United States, where it is not illegal, it may be well for us to show that general strikes are against the welfare of the workingman.

The British Columbian store clerks and lumberjacks are seeking to strike to raise the wages of the miners and therefore the price of the coal they use. After a while they will ask the miners to strike with them to raise the wages of clerking and lumbering, thus increasing the price of the goods the miner buys and of the lumber he uses. All this would be a diverting pursuit of increased wages and decreased purchasing power, and would work no one any harm if it were not for two considerations; one, that no one will pay store clerks, lumberjacks and miners when they are idle, so that they all alike will all lose; and, two, that if the wages get too high in that "tight little island," no one will be willing to pay for the goods it produces.

The general labor strike is a folly. It is as if the hands of all mankind banded together and entered into conflict with their heads. Surely no good could come of such a quarrel, for the happiness of man is bound up in the union between the man's head and his hands in which both help each other. No good could come to the hands if all the heads were beaten to a jelly, while on the other hand the feeling of a single head and a pair of hands might be transcendently jubilant if all the other heads and all the other hands needed triangle bandages and splints.

The important solidarities of mankind are industry bonds rather than class bonds, though in a regrettable way employers unite against workers and workers against employers. Moreover, when solidarity is rightly attained, there will be no private interest either of class or of industry. The happiest individual would be the man who could live where all are prosperous and all have the adroitness of mind and cheerfulness of spirit which comes from well remunerated toil.

Strikes are generally believed by the advocates of trades unionism to encroach on the profits of capital, and indeed they did so when they did not involve the whole industry at one time, for then they merely brought the wage scale of one factory or mine up to that of its competitor, but now that they are almost national in any one trade their effect is almost always to raise prices to the consumer and to upset the balance of living of other workingmen. The labor conflicts of the twentieth century are apt, like the national wars of the seventeenth and earlier centuries, to plunge the world into a needless penury.

We must never forget that though these later conflicts destroy but little and though the efficiency of the workman is continually on the increase, his comfort and wealth must be immensely depleted if he is to produce only a short part of the year. And moreover, it is likely that because the populousness of the world is continually on the increase there will be an increasing need to build up the capital of the race in order to make possible the utilization of lands and mineral deposits of inferior value. This cannot be done if the people are to reduce their productivity by idleness of a character which does not add to their efficiency.

But This Is about Oil

We wish that we could take some hope from the facts we are about to relate, but the story is about other fuel than coal; it is about oil. It has been rumored that the small oil man needs help though his smallness is only relative. His profits have always been large and the extravagances of men made rich by oil have passed into a fable. No one has discussed the tips, the libations and the follies of the coalman. He has rather been represented as miserly and grasping. The reason is clear; he has not been empowered by his wealth to be liberal and to scatter his coins like a princeling to the people on the street.

But we do not pretend to understand the difference between oil and coal. When crude oil rises 100 per cent. in a few months, everyone says "Good for the oil man; that will help the producers." At the same time, coal is raised 10 or 12 per cent., and the remarks on the street are too contemptible for repetition. We will be frank; we cannot tell where the difference arises. Even when wages are increased, the people grit their teeth and say coal should not increase in price, yet on the other hand, crude oil always rises on the principle enunciated in the motto "Make the traffic pay all the traffic will stand."

In the progressive state of Oklahoma, there is a Corporation Commission which has been regulating matters of all kinds in a high-handed manner. Some time ago, someone complained that gasoline was too high in his little village and he desired the commissioners to order a reduction in price. From that time on the Commission has been busy with oil questions. The producers declared the Trust was discriminating against their oil, that it was not supplying pipe-line capacity to take care of their product, was endeavoring to "freeze them out" and was, moreover, producing as well as selling oil.

At first the Commission attacked the pipe-line companies and then suddenly finding that too much oil was being produced and that the price would certainly fall and more oil would be for sale than would be needed at the terminal points, deliberately threatened to cut off the production from such wells as were drilled contrary to their orders, and ceased to berate the Trusts for not doubling their line capacity.

So they made these rules which we do not quote verbatim, as they are most ineptly worded:

It is therefore ordered that the Texas Co., the Gulf Line Co., of Oklahoma and the Prairie Oil & Gas Co. shall be relieved as common purchasers from taking the production of any wells brought in, on or after July 1914, except:

(1) Wells where the lease conditions require drillings within a definite date. Such wells shall be drilled on the lease at a point where it will not be necessary for adjoining properties to offset the same. [That is, they must be drilled so far from the property line that they will not draw the oil away from under a second property.—Ed.]

(2) Wells on properties which have no production and adjoining properties which may have a tendency to drain same, even though they would not come strictly under the offset rules.

(3) Wells which are now being drilled.

(4) Wells necessary for opposing the draft of oil by producing offsets.

(5) Wells drilled on short-term leases to comply with Federal court orders where receivers have been appointed.

Furthermore, they also exempt the pipe-line companies from taking oil from any well "squibbed or shot" to the Bartlesville sand in the Cushing field during the period of exemption and order that the companies transporting oil, shall not be required to accept oil from any new well drilled under the five exemptions listed above if, being drilled in the Cushing district, it goes more than 60 ft. into the Bartlesville sand, unless the Commission orders otherwise.

The whole of this restrictive action is alleged to be with the idea of conserving oil, but is really provided to keep up the price and the commissioners are at no pains to deny that the order is made to help the producers, and in answer to their clamor. They have declared that if the producers will not help enforce the regulation, the Commission will let the whole matter severely alone, that is, let the oil be wasted; so little are they conservationists. They are afraid oil might fall to 3c. per bbl., as it did at one time in Texas.

But let us not suppose the Oklahoma producers are losing money, not at all. The papers are full of records of the fortunes being made, and those producers who are not able to take advantage of the prices liable to be artificially created, are not pleased that they cannot sink enough wells to get a plethoric fortune.

If the opening of new coal mines were forbidden, the miners would not realize any noticeable restriction of the opportunities to labor because the work of opening is a small item compared with that of operating. But the oil industry is self operating in much of the Cushing field and will not need even dynamiting if in the Bartlesville sand. In fact, only one well reaching down to that sand has needed to be so treated. Consequently all the work in the field consists in drilling and preparing to drill, and the restrictive order has laid a number of men idle.

But what does it matter, the oil interests must be appeased. The poor oil millionaires must make money; the market must not be demoralized. Oklahoma, the great baiter of the trusts, has now taken thought and has created a trust more discreditable than any which has ever preceded it, and has chosen for its ill advised action, that business which has led to fortunes which have been the wonder of the world and in a field where the production has been more prolific than in any other state.

And the moral is clear. The Oklahoma oil producer has continually urged his rights on the legislature, has published his hopes and fears broadcast, has in short, advertised his woe. He has always had a grievance and at last, he has found in Commissioner Henshaw, a sympathetic listener. We believe he has been too successful and that his profits have been excessive, and it is probable that in a few months, the action of the commissioners, producers and pipe-line men will be rightly condemned. The better plan would have been to have required that every producer be ordered to provide storage for his oil or leave it underground.

A Contrast

Julian Street, writing in *Collier's,* quoted Henry Ford, the builder of the popular automobile, as follows:

We've done two hundred and fifty millions of business to date. Our profits have amounted to about fifty-nine millions. About twenty-five per cent. has been put back into the business—into the plant and branches. All the actual cash that was ever put in was twenty-eight thousand dollars. The rest has been built up out of profits. Yes; it has happened in a short time; the big growth has come in the last six years.

This may well be called making money. We are constantly reminded that coal men seem prosperous, have fine houses, and must make money somewhere if not in coal mining. Howbeit, we have never noticed anything striking in the residences they erect. But did one ever hear of a coal corporation starting with $28,000 and after only a few years, acquiring from profits a plant worth roughly $15,000,000, having paid meanwhile about $44,000,000 in dividends? In fact, the talk about coal barons is extremely misleading. In no business have profits been so small and uncertain, and surely all the coal companies have not been badly managed.

The time has certainly come when other corporations than coal and public-service companies receive a ray of the fierce light of investigation. Surely there is no reason why those who render an essential service to humanity should receive all the abuse, should be forbidden to protect themselves by reasonable combination, and should be considered fit subjects for restrictive laws.

The logic of the situation urges everyone to seek his profits and his living in providing for the luxuries and in meeting the extravagances of the multitude, and not in supplying them with staple articles on which their real happiness depends. Moreover, as a corollary we may ask whether manufacturers whose profits are so unreasonable, have any right to demand of coal men that they either operate their mines continuously, conceding all the demands of their employees, or else turn their holdings over to the state.

With such magnificent profits as the manufacturers often secure we cannot wonder that they feel they are the chosen of the nation, nor can we marvel that like spoiled children, they sometimes make imperious demands. When they themselves make such fair profits it is easy to explain how it is they always imagine the coal man has a princely surplus to divide with his employees.

Dr. George Halberstadt, who is at the head of the Philadelphia & Reading Coal & Iron Co.'s first-aid corps, in a recent speech before Reading Coal Company employees, said:

"Not one of you would dream of sitting down to dinner under a loose ceiling that looked as if it were about to fall, and yet some of you deliberately work for five hours a day under a loose roof in the mine."

How very true and pertinent is this homely simile of Dr. Halberstadt.

Legal Department

Legislative Regulation of Weights

By A. L. H. Street*

Congress having failed to fully exercise its right to fix the standard of weights and measures, it has been decided by the courts that the states are left free to make reasonable regulations on the subject, for the protection of the public. Accordingly, a Louisiana law prohibiting sale of coal contained in boats or barges until the same has been officially gaged, was upheld by the United States Supreme Court in the case of Pittsburgh & Scranton Coal Co. vs. State, 15 Supreme Court Reporter 459. The validity of the statute was unsuccessfully attacked on the ground that it interferes with interstate commerce, and discriminates against coal carried by vessels in favor of coal carried by rail. And a statute in force in Missouri requiring every sale of coal to be made on the basis of the actual weight thereof, and making it unlawful for a buyer to deduct any amount from the actual weight under claim of right to do so by reason of any custom, rule or pretense, was upheld by the same court in the case of House vs. Mayes, 31 Supreme Court Reporter 234.

Where a law requires coal sold in certain quantities to be weighed by an official weigher and a certificate of the weight to be delivered to the buyer, there can be no recovery of the price unless there is an official weighing and such certificate is issued. (Massachusetts Supreme Judicial Court, Libby vs. Donnely, 5 Allen's Reports 299.) There is no valid compliance with such a requirement where the weigher is the owner of the coal or is selling it on commission. (Smith vs. Campbell, 68 Massachusetts Supreme Judicial Court Reports 268.) And, under a Maine statute requiring coal to be weighed by a sworn weigher, "unless the parties otherwise agree," it was held that there was no showing of an agreement waiving such weighing, although it appeared that the buyer accepted the coal without objection, and offered to give his note for the price, and had paid for similar lots of coal weighed by the seller's bookkeeper. (James vs. Josselyn, 65 Maine Supreme Judicial Court Reports 138.)

Mistakes in Quoting Prices

When a coal company, in quoting a price on a shipment, inadvertently quotes a lower price than was actually intended, through stenographic or other clerical mistake, and the offer is accepted, is the company bound by the contract? This situation arises, doubtlessly, in the coal trade frequently the same as it does in other lines of business. Based on the decisions of the courts, the answer to this question must be that, notwithstanding the mistake, the contract is binding on the coal company, unless it can show that the person to whom the offer was made knew or ought to have known of the mistake. If this latter condition can be established, however, then there is a very recent court decision to sustain the proposition that the coal company is not bound. This decision did not arise in the coal trade, but the principles involved are equally applicable to sales of all kinds of commodities which have a market value.

A Texas seed house offered to sell a quantity of millet seed at $1.35 the hundredweight at a time when the market price was $2.35, which the house intended to quote; the quoted price being the result of a clerical error. The Kansas seed house to which the offer was made immediately wired an acceptance of the offer, without stating the price, and sued for breach of contract, when the Texas concern, on discovering the mistake, refused to deliver at $1.35.

In relieving the Texas company from liability, the Texas Court of Civil Appeals said in this case, Barteldes Seed Company vs. Bennett-Sims Mill & Elevator Company, 161 Southwestern Reporter 399: "Ordinarily, when the mistake is not mutual, courts will not relieve the party making it against his own negligence or inattention; but we think a different rule should apply when the evidence shows that the party accepting the mistaken offer knows of the mistake when he accepted it and that he should not reap the benefit of the mistake to the evident injury of the other. We think that fair dealing and good conscience should require an opportunity to correct the error, before trying to found a binding contract on it. . . . The evidence in this case is that both parties knew the market value of the millet seed on Apr. 17, 1912. Upon receiving a letter from a dealer in that commodity, appellant must have known that $1 per hundredweight less than the market value was a mistake. That they did is evidenced by the telegram to 'Ship quick.' It did not wire back that 'Your $1.35 per cwt. offer is accepted.' . . . We think that it is manifest from the evidence that appellant knew a mistake had been made, and sought to take advantage of the mistake by an immediate acceptance.

*Counsellor-at-Law, St. Paul, Minn.

Recent Judicial Decisions

Duty to Warn Inexperienced Miner.—A coal company must warn an inexperienced miner against special dangers incident to his employment. (Iowa Supreme Court, Looney vs. Garfield Coal Co., 147 "Northwestern Reporter," 129.)

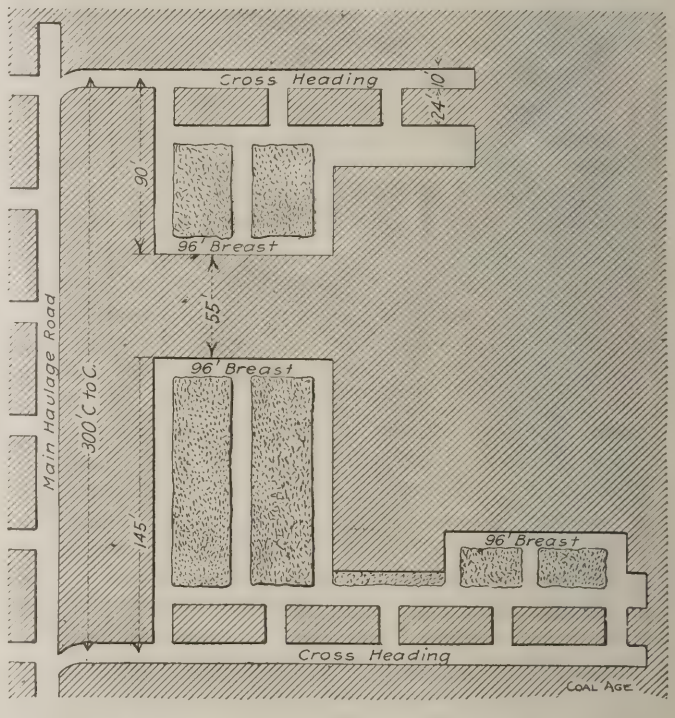
When a Mining Company Becomes a Public Service Corporation—A mining company engaged in furnishing surplus electricity to private consumers is subject to regulation as a public-service corporation, so far as such service is concerned. (West Virginia Supreme Court of Appeals, Wingrove vs. Public Service Commission, 81 Southeastern Reporter 734.)

Validity of Coal Weighing Ordinance—An ordinance requiring all coal sold and delivered in the city, excepting in carload lots, to be weighed on the city's scales, and requiring payment of a ten-cent fee for the service and issuance of a weight ticket is a valid regulation. "The dealers can readily add the increase in expense to the price which they formerly charged for coal and protect themselves from any loss on account of the regulation." (Wisconsin Supreme Court, Brittingham & Hixon Lumber Co. vs. Sparta, 147 Northwestern Reporter 635.)

Discussion By Readers

Working Coal Seam with Heavy Parting

Letter No. 6—The proposition submitted by Mr. Morck, COAL AGE, June 13, p. 981, I regard as being practicable, so far as the successful extraction of the coal is concerned. The degree of profit attending the operation would depend upon the method adopted and the relative cost of labor and market value of the coal produced. Mr. Morck has omitted a very important factor, namely, the condition of the seam with respect to gas.



However, leaving this factor out of consideration, and regarding only the question of the adaptation of the two general systems of mining or some modification of the same, to the conditions given, permit me to say that I do not regard the longwall advancing method as adapted to this case for the following reasons: 1. The average thickness of the rock parting being 1 ft. and the two coal benches taken together being 5 ft. in thickness, gives an average thickness of 6 ft. for the entire seam, and the construction of packwalls, in an opening of this height, would involve a large expense. 2. The quantity of refuse available in the seam would not be sufficient to build packs of this size, and it would be necessary to bring material from the surface into the mine to complete the work, which would greatly increase the expense. 3. The seam being composed of material of different hardness, the resistance to the pressure of the overburden would vary in the several strata of the seam. While the effect arising from this condition might not manifest itself for some time, it is apt to prove a dangerous factor in the later development of the mine.

I have had experience in the working of a seam of coal having the same general composition as that given by Mr. Morck. The coal, however, was inferior in quality, and the roof conditions were bad. Notwithstanding these facts, the seam was mined with profit on the room-and-pillar system. The workmen, in both rooms and entries, were paid a cent per inch per lineal yard, for all rock over 4 in. in thickness. The price per yard was based on an average thickness of the rock parting, for each two weeks. The men on pillar work received no extra compensation. In this case, the coal was mined by pneumatic machines, in the bottom of the seam, and the rock was blasted with the coal. This method presented at least two important disadvantages. 1. The increased labor expense for removing the rock in the rooms. 2. The inferior quality of the coal produced by blasting the rock with the coal.

I recall seeing a modification of longwall advancing in operation in the northern bituminous field of Pennsylvania, in a 2-ft. seam of coal. I believe, with slight modification, the same method could be employed in the working of the present seam. The mine was opened on the double-entry system, the haulage roads being driven with a headroom of 5 ft. 2 in. above the rail, while the back heading was driven 4 ft. in height. Both of these entries were driven with a "skip" for gobs.

A coal face 96 ft. in length was opened off the back entry in sections of 24 ft. each, these being worked in steps. Between the consecutive 96-ft. breasts, a 4-yd. pillar was left. The breasts were driven a distance of 75 yd. and no cut-throughs were made in the pillars between them. From the haulage road of the next pair of cross-entries, a heading was driven to meet the breasts just mentioned; and from these headings other breasts were driven up parallel to the cross-entries. These last, however, were driven as a single breast, there being no pillars separating them. The roof conditions being good, no effort was made to construct packs.

It can readily be imagined that this method would afford little opportunity for good ventilation, and would probably entail a loss of considerable coal. The modification I would suggest, is shown in the accompanying diagram, which shows the main-haulage road on the left

A MODIFIED LONGWALL-BREAST WORKING

and two cross-headings driven 10 ft. wide to the right and, say 300 ft. apart, center to center. A barrier pillar 50 or 60 ft. in width is left to protect the main-haulage road. Inside of each cross-heading, and parallel thereto, is driven a 24-ft. place or room parallel to the cross-heading with which it is connected by crosscuts every 20 yd.

As the cross-headings and 24-ft. places advance, 96-ft. breasts are opened out on the ribs of the latter, and driven to intersect a similar breast that is opened in the same manner, from the 24-ft. place paralleling the next cross-heading. These breasts can be worked in steps or as a single face, depending on the conditions of roof and

floor. Modifications can be made in this general method, in respect to width of pillar and opening and method of extraction of the coal, whether on the advancing or retreating plan, so as to adapt it to the conditions existing in the mine.

The system affords a good opportunity for ventilation, avoids the expense of much yardage, and, with proper care, practically no coal need be lost. A sufficient width of pillar should be left between consecutive 96-ft. breasts, to enable these to be drawn back when the breasts reach the limit, without loss of coal.

The coal can be mined by pick or machine, as conditions render advisable. I would do the mining in the bottom-coal stratum and blast down the rock and upper coal separately, for the following reasons: 1. While more holes will have to be drilled, the amount of charge for each hole will be proportionately small, which will decrease the possibility of blownout shots occurring. 2. By blasting the rock and coal separately, cleaner coal is obtained and the expense of picking the coal outside is reduced. Also, the rock is handled more readily before the coal is taken down. 3. More lump coal will be obtained from the upper seam. 4. The daily output per man is increased. I believe this method, if adopted, would greatly reduce the cost of production, per ton of coal mined, and insure greater safety to the workmen than is possible in the common longwall system; and will prove less expensive than the room-and-pillar system of mining.

I. C. PARFITT.

Jerome, Penn.

Effect of the Mine-Run Law

I was pleased to note, in a recent editorial, COAL AGE, June 13, p. 974, that the mine-run law recently passed in Ohio, is not meeting the favorable reception that was hoped by its advocates, in its practical working. Experience in Kansas has led me to predict that the passage of this law in Ohio could only bring disastrous results to the mining industry throughout the state. The following brief references to the practical working of such a law cannot fail to convince the most skeptical that the results following in the wake of such legislation can only be disastrous to the industry at large:

Under the operation of the mine-run law as a basis of payment for miner's coal, the miner is only interested in increasing his daily output of coal, regardless of its condition. To accomplish this, he uses an excessive amount of powder and shoots his coal off the solid, without undermining or cutting the shot. This class of work does not require any skill or knowledge on the part of the miner; and, as a result, the mines are fast being overcrowded with unskilled and ignorant workmen. There is greater danger of the occurrence of blownout shots when the coal is thus shot off the solid. Not only is the coal shattered and broken, producing a large amount of a lower-grade and, in some cases, unmarketable coal, but the heavy shots loosen the roof and are thus the direct cause of many accidents from falls of roof. The heavy shooting also blows out the timbers and makes the working places unsafe.

This reckless style of mining is also responsible for the production of large quantities of fine dust, at the working face and on the roadways, thereby increasing the danger of dust explosions. In shallow mines, particularly, the damage to the roof by hard shooting and the resulting heavy roof falls cause the loss of large areas of coal that could have been worked out profitably by a more careful drifting and mining of the coal. The result is, in such districts, it is common to see "stripping" methods employed, the shallow surface being removed with steam shovels, by which many acres of surface land are destroyed and rendered worthless forever. There is still another consideration; these surface strippings produce a better grade of coal than is taken from the shaft mines, with the result that the former secure the bulk of the trade, while work at shaft mines is often slack.

The legitimate results of the mine-run law may, therefore, be summed up briefly, as decreasing the revenue from the sale of coal, by producing larger quantities of a lower-priced quality; causing the loss and abandonment of much coal that could be otherwise profitably worked; increasing mine accidents due to falls of roof, explosions of coal dust and gas; overcrowding the mines with unskilled and ignorant workmen; and, finally, destroying large areas of surface lands that would, by cultivation, prove a greater source of revenue than the coal taken from underneath them.

Scammon, Kan.

Co-operation in the Mines

An item on the editorial page of COAL AGE, Apr. 18, p. 654, states: "Much good would result if coal companies would make compulsory a weekly meeting of superintendents, mine foremen, fire bosses, master mechanics, hoisting engineers, etc." I am in thorough accord with this idea, but would omit the word "compulsory."

Some months ago I instituted a series of weekly meetings of my mine foremen, by sending each one a request that he would so arrange his affairs as to meet the superintendent at the company's office on the next Wednesday evening. The time was specified as from 7:30 to 8:30, and all were present. At this meeting, the object of the gathering was stated, a general discussion held, the views of the different foremen secured, and a subject for discussion at the next meeting selected. The men were informed that while their attendance was earnestly desired, there was no intention to compel them to come; that the object was to obtain coöperation between the men and the management, with a view to increasing the efficiency; and for the further reason that an interchange of views and experience between themselves could not but prove beneficial to all concerned.

There was a cordial assent to the idea, on the part of the foremen, and a full attendance at the next meeting resulted. The subject assigned for that meeting was "Safety First," and a request had been made that each foreman should report what he had done or was doing in the way of safeguarding the men under his charge, against accident. They were also requested to report on unsafe conditions that they had observed and, for any reason, had been unable to remedy, and further to make any suggestions that occurred to them along the same line.

This meeting was very productive of results. Many valuable suggestions were made and much interest was aroused in regard to the best means of preventing acci-

dents. Many things were brought to the management's attention that might otherwise have escaped notice; and a vigorous and healthy movement was started for the removal, so far as possible, of all dangerous conditions.

These meetings have since been held regularly every week. They are wholly informal, each man expressing his views freely, and the chairman merely acting to guide the discussion and keep it somewhere within the limits of the assigned topic. At first, I acted as chairman, myself; but later each foreman, in turn, was asked to preside at a meeting; and the idea has now developed, so that each chairman suggests, at his meeting, the subject for discussion the following week. Meetings are strictly limited to one hour in length; but there have been occasions when the foremen refused to adjourn at the end of sixty minutes, and kept up an interesting discussion and debate for an hour and a half.

Each foreman is at liberty to bring anyone with him whom he thinks would be interested in the subject under discussion; as, for instance, his assistant foreman, machine boss or boss driver; and these visitors are always asked to take part in the discussion. The master mechanic, outside foreman and the engineers usually attend, also; and many of the meetings are marked by interesting and valuable discussions. Among the subjects so far discussed, besides Safety First, may be mentioned, The Recovery of Pillar Coal; Machine vs. Pick Mining; Cost of Haulage; Recovery of Material; Treatment and Handling of Stock in the Mine; etc.

The results obtained by these meetings, I do not hesitate to say, have been good. Much interest has been shown by the foremen and a spirit of coöperation and friendly rivalry aroused, both of which tend toward increased efficiency. The attendance of the meetings has been all that could be desired. Unfriendly criticism is not allowed; but different methods are discussed and debated with the greatest freedom. It has frequently happened that suggested changes in methods have been put in force, and given a thorough trial. If the change proved more economical or efficient than the old method, it was adopted as standard practice, in the camp.

The foremen are also encouraged to visit one another's mines, with a view of studying the different conditions, which "the other fellow" is up against, and observing how he has solved his difficulties. This, also, we hope will be productive of much good. I have written this brief account in the hope that the method adopted here may be approved and undertaken by others similarly situated, and our crude ideas enlarged and developed by others.

Superior, Wyo.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

Dry and Wet Air Compared—Strange as it may at first appear, wet air is lighter than dry air, volume for volume. This is because the water vapor in the air is much lighter than the same volume of air which it displaces. The specific gravity of water vapor referred to air as a standard or unity is 0.6235.

The weights, per cubic foot, of water vapor, dry, partly-saturated and fully-saturated air, respectively, are calculated by the following formulas:

Water vapor, $$w = 0.6235 \frac{c\, p_v}{0.37\, T} \quad (1)$$

Dry air, $$w = \frac{p_a}{0.37\, T} \quad (2)$$

Air partly saturated, $$w = \frac{p_a - 0.3765\, c\, p_v}{0.37\, T} \quad (3)$$

Air fully saturated, $$w = \frac{p_a - 0.3765\, p_v}{0.37\, T} \quad (4)$$

w = weight (*lb. per cu.ft.*)
c = degree of saturation, expressed as a *decimal*
p_a = atmospheric pressure (*lb. per sq.in.*)
p_v = saturated-vapor pressure (*lb. per sq.in.*)
T = absolute temperature (*deg. Fahr.*)

It is readily seen, from formulas 2, 3 and 4, that perfectly dry air is always heavier than air containing water vapor, and that the weight of air decreases as its degree of saturation increases. The weight of moisture in air is usually estimated in grains instead of pounds, per cubic foot, and it is necessary to multiply the results obtained from the above formulas by 7000 (1 lb. = 7000 grs.).

The same formulas expressing the atmospheric pressure and the vapor pressure in inches of barometer, instead of pounds per square inch, are as follows:

Water vapor, $$w = \frac{0.82757\, c\, p_v}{T}$$

Dry air, $$w = \frac{1.3273\, B}{T}$$

Air partly saturated, $$w = \frac{1.3273}{T}(B - 0.3765\, c\, p_v)$$

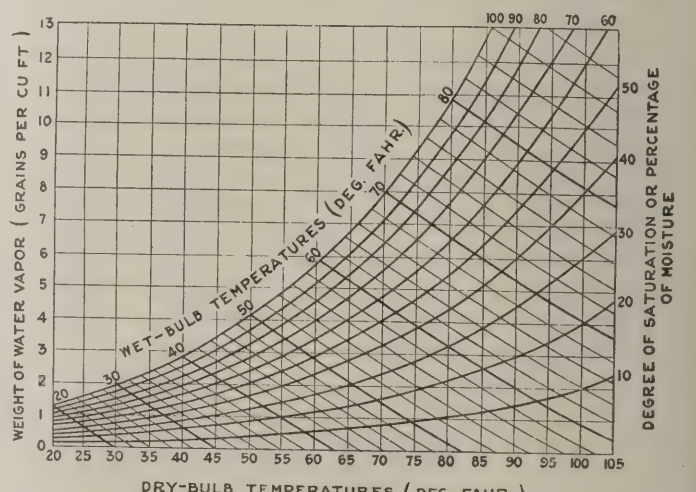
Air fully saturated, $$w = \frac{1.3273}{T}(B - 0.3765\, p_v)$$

It is evident that when air is fully saturated, $\mathbf{c} = 1$, and disappears from the formula. The values of $\mathbf{p_v}$ are given in a preceding table, in pounds per square inch and inches of mercury.

Important—Properly speaking, a vapor does not saturate the air, but the space it occupies; since, for any given temperature, the same weight of vapor serves to fill a given space whether that space is full or void of air. Commonly speaking, vapor is said to be saturated or unsaturated according as the space it occupies is saturated or otherwise.

The Coal Age Pocket Book

Laws of Vapors—The following laws express the chief characteristics of vapors:



1. Vaporization takes place at the surface of all volatile liquids, at all temperatures, till the space surrounding the liquid is saturated or the critical temperature is reached.

2. Vapor pressure (different for different vapors) depends on the temperature and the degree of saturation.

3. For any given temperature, the weight and pressure of a vapor saturating a given space is the same whether that space is full or void of air or other gas.

4. Saturated-vapor pressures increase with the temperature, and when equal to the pressure above the liquid vaporizing, the ebullition of the liquid begins, which marks the **boiling point** of the liquid for that pressure.

5. In a confined space, a further addition of heat to the liquid causes a rise of both temperature and vapor pressure till an equilibrium of densities of liquid and vapor stops further vaporization and marks the so called **"critical temperature"** for that liquid.

A Humidity Chart

The above diagram is useful in showing at a glance the weight of water vapor that will saturate a cubic foot of space at any temperature from 20 to 105 deg. F. and the degree of humidity for different dry- and wet-bulb readings of the psychrometer.

Inquiries of General Interest

Study Question--Ventilation

In the later development of a coal mine opened some time since in a seam of clean coal 3 ft. 8 in. thick, the ventilation became insufficient, the requirement of the mine being greater than the capacity of the present fan. After a thorough examination of the mine, the mine inspector decided that, in order to comply with the mine law, a circulation of 180,000 cu.ft. of air per minute was necessary. He requested that this air current should be circulated in three natural splits, as follows:

Split A, 8 × 10 ft., 3600 ft. long
Split B, 6 × 12 ft., 5000 ft. long
Split C, 7 × 14 ft., 4500 ft. long

I would like to ask where the regulators should be placed in these airways; and what will be the size of the opening in the regulator, in each split. Also, what will be the least expenditure of power, in order to produce the required circulation in these splits. Assuming a single intake fan, what must be the required diameter of the fan that will produce the required volume of air in this mine?

The mine is a drift opening, and the main air current of 180,000 cu.ft. per min. must pass through the main airway, which is 6x14 ft. and 800 ft. long, including its return, to the point where the air is divided between the three splits mentioned.

HARRY M. DANIELS, Mine Foreman,
Cabin Creek Consolidated Coal Co.
Wake Forest, W. Va.

In answering this question, it should first be stated that no regulators are required in the *natural* division of an air current. It is only when a proportionate division is required that regulators must be introduced in every split but one, which remains open. The purpose of the regulators is to increase the pressure in each of those splits where the regulators are placed, to make it equal to the natural pressure of the free or open split. The "free split" is one having the highest natural pressure; and this pressure becomes the ventilating pressure for all the splits.

The areas, perimeters and lengths of the main airway and splits, respectively, are as follows:

Main airway $a = 84$ sq.ft.; $o = 40$ ft.; $l = 800$ ft.
Split A, $a = 80$ sq.ft.; $o = 36$ ft.; $l = 3600$ ft.
Split B, $a = 72$ sq.ft.; $o = 36$ ft.; $l = 5000$ ft.
Split C, $a = 98$ sq.ft.; $o = 42$ ft.; $l = 4500$ ft.

In the present case, the division being natural, the quantity of air passing in each split is proportional to its pressure potential. The respective potentials for the main airway and the three splits are as follows:

Main airway, $X_1 = a\sqrt{\frac{a}{lo}} = 84\sqrt{\frac{84}{800 \times 40}} = 4.304$

Split A, $X_a = 80\sqrt{\frac{80}{3600 \times 36}} = 1.988$

Split B, $X_b = 72\sqrt{\frac{72}{5000 \times 36}} = 1.440$

Split C, $X_c = 98\sqrt{\frac{98}{4500 \times 42}} = 2.232$

Sum of split potentials, ΣX_p 5.660

The quantity of air passing in the main airway and each respective split is, then, as follows:

Main airway, (*total circulation*) 180,000 *cu.ft. per min.*

Split A, $q_a = \frac{1.988}{5.66} \times 180{,}000 =$ 63,220 *cu.ft. per min.*

Split B, $q_b = \frac{1.44}{5.66} \times 180{,}000 =$ 45,800 *cu.ft. per min.*

Split C, $q_c = \frac{2.232}{5.66} \times 180{,}000 =$ 70,980 *cu.ft. per min.*

Since the pressure for all the splits is the same, the split pressure may be calculated from any one of these splits, as, for example, Split A. This split pressure when found must be added to the pressure required to pass the total quantity of air through the main airway, to obtain the total mine pressure; thus:

Splits, $p_a = \frac{klOq^2}{a^3} = \frac{0.00000002 \times 3600 \times 36 \times 63{,}220^2}{80 \times 80 \times 80}$

$= 20.23$ *lb. per sq.ft.*

Main airway, $p_1 = \frac{0.00000002 \times 800 \times 40 \times 180{,}000^2}{84 \times 84 \times 84}$

$= 34.98$ *lb. per sq.ft.*

Total mine pressure . . . . . 55.21 *lb. per sq.ft.*

Or these unit pressures may be found by dividing the quantity of air passing in any airway, by the corresponding pressure potential, and multiplying the square of the quotient by k; thus,

Splits, $p_b = k\left(\frac{q_b}{X_{pb}}\right)^2 = 0.00000002\left(\frac{45{,}800}{1.44}\right)^2$

$= 20.23$ *lb. per sq.ft.*

Main airway, $p_1 = k\left(\frac{Q}{X_{p_1}}\right)^2 = 0.00000002\left(\frac{180{,}000}{4.304}\right)^2$

$= 34.98$ *lb. per sq.ft.*

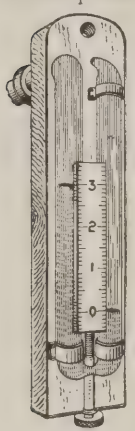
Total mine pressure . . . . 55.21 *lb. per sq.ft.*

The horsepower on the air, in this case, is

Horsepower, $H = \frac{Qp}{33{,}000} = \frac{180{,}000 \times 55.21}{33{,}000} =$ *say* 300 *hp.*

Allowing 60 per cent. for the efficiency of the fan and engine, which is customary practice, the indicated horsepower of the engine driving the ventilating fan would be 300 ÷ 0.60 = 500 hp. We would not recommend building a fan that would be designed for this circulation, inasmuch as the ventilating pressure required is far too high for the economical ventilation of the mine. The air current should be further split to reduce this pressure to, say from 10 to 15 lb. per sq.ft. of section.

Examination Questions



Montana Mine-Foremen's and Firebosses' Examination

(Continued from last issue)

Ques.—What is meant by the terms, "ventilating pressure," "water gage" and "resistance of air?"

Ans.—Ventilating pressure is the pressure producing the ventilation. The term properly describes the total pressure exerted on the entire sectional area of the airway. The *unit* of ventilating pressure is then the pressure per square foot of sectional area. The expression "ventilating pressure," however, is often used when the unit pressure is meant.

A water gage is a bent glass tube attached to a standard or base, as shown in the accompanying figure. The water placed in the bend of the tube is acted on by the air pressure, which is exerted through each of the open ends. One of these ends is bent at right angles so that it can be extended through a hole in a brattice on which the instrument is placed. The brattice divides the intake airway from the return. The water in the gage is thus acted upon by two different pressures, the intake and the return pressures. The intake pressure being always the greater, depresses the water in that arm of the gage, the liquid rising an equal amount in the other arm. The difference between the water levels, which in the figure is 3 in., indicates the difference of pressure between the intake and the return airway. This is the unit of ventilating pressure, and is equal to 5.2 lb. per sq.ft. of area, for each inch of water-gage reading; or $3 \times 5.2 = 15.6$ lb. per sq.ft.

A Water Gage

The resistance of the air, in mine ventilation, is due to the friction of the air current rubbing against the sides, top and bottom of the airways and striking against other obstructions in the passage. It is this resistance to the passage of the air current that produces the ventilating pressure, to which it is equal.

Ques.—If an open light is placed in a large body of marsh gas unmixed with air, what would be the result? Give your reasons.

Ans.—Assuming that it were possible to place a lighted safety lamp within a large body of marsh gas unmixed with air, the flame of the lamp would thereby be deprived of the oxygen necessary to support its combustion and, as a result, would be promptly extinguished by the gas. Flame cannot burn in the absence of oxygen, and there is no available oxygen in marsh gas (CH_4), unless the gas is diluted with air.

Ques.—How many cubic feet of air is passing per minute along an airway 6 ft. high and 10 ft. wide, the velocity of the air current being 450 ft. per min.?

Ans.—The sectional area of this airway is $6 \times 10 = 60$ sq.ft. Assuming the given velocity is an average reading for the entire area of the airway, the volume of air passing is $60 \times 450 = 27{,}000$ cu.ft. per min.

Ques.—According to the Montana State mining law, what quantity of air should be circulated in a mine with 200 men and 20 mules?

Ans.—The mining law of the state requires a circulation of not less than 100 cu.ft. of air per min. for each person and 600 cu.ft. per min., for each animal employed in the mine; but in a mine generating firedamp, the volume of air required is 150 cu.ft. per min. for each person employed. Therefore, assuming no firedamp is present, the volume of air required, in this case, is $200 \times 100 + 20 \times 600 = 32{,}000$ cu.ft. per min. If firedamp is present, the volume of air required will be 42,000 cu. ft. per min.

Ques.—If a fan should double its speed, what increase would there be in the ventilating pressure, and in what proportion would the quantity of air be increased?

Ans.—Roughly speaking, other conditions remaining unchanged, the quantity of air in circulation varies as the speed of the fan and the ventilating pressure as the square of the speed. On this basis, the quantity of air in circulation would be doubled and the pressure increased four times, by doubling the speed of the fan. In actual practice, however, the quantity of air will be increased only one and three quarters times and the water gage three times the original amount, by doubling the speed of the fan.

Ques.—Explain the constant 5.2 used in connection with water-gage calculations.

Ans.—This constant expresses the pressure in pounds per square foot corresponding to a water-gage reading of 1 in. A cubic foot of water weighs approximately 62.5 lb. The weight of water distributed over 1 sq.ft., in a layer 1 in. in depth, is, therefore, $62.5 \div 12 = 5.2$ lb. Since water in equilibrium rises to the same height, regardless of the sectional area of the vessel, a water-gage reading of 1 in. represents a layer of water 1 sq.ft. in section and 1 in. deep, and corresponds to a pressure of 5.2 lb. per sq.ft.

Ques.—If 55,000 cu.ft. of air is passing through a circular shaft 10 ft. in diameter, what is the velocity per second?

Ans.—The sectional area of a shaft 10 ft. in diameter is $0.7854 \times 10^2 = 78.54$ sq.ft. The velocity of the air current, in this case, is $55{,}000 \div 78.54 =$ say 700 ft. per min.; or $11\frac{2}{3}$ ft. per sec.

Ques.—What are the features that render some safety lamps more sensitive to gas than others?

Ans.—The principal feature that renders a safety lamp sensitive to gas is a free upward circulation of air through the lamp, as is the case in the unbonneted Davy lamp. In other lamps, an important feature, in this regard, is the entry of the air below the flame of the lamp; it is also important to have a free unobstructed discharge of the burned gases in the upper part of the chimney. Volatile oils and hydrogen gas afford flames sensitive to gas.

Coal and Coke News

WASHINGTON, D. C.

The Interstate Commerce Commission has handed down a decision in the case of the Hughes Creek Coal Co. vs. the Kanawha & Michigan Ry. Co. as well as in the case of the Kelly's Creek Colliery Co. vs. the same. In this case it is held that there may properly be a slight difference between the rate on coal applicable to the through routes ordered and those applicable to the single movement on the Chesapeake & Ohio, this difference not to exceed 5 cents per ton.

The decision arrived at in this case is based upon the original decision of the Commission in the same cases regarding rates on coal from mines on the Kanawha & Michigan Ry. to various Eastern and Southeastern destinations. The substance of the Commission's original decision was this: It appeared that the Kanawha & Michigan and the Chesapeake & Ohio, operating in the Kanawha district, parallel each other for a distance of about 50 miles on opposite sides of the Kanawha River, with a junction at Gauley, W. Va.

Complainants are coal companies situated on the Kanawha & Michigan who were petitioning for an outlet to markets east and southeast of them. At the time of the petition, to reach these destinations they were compelled to pay the sum of the Kanawha & Michigan's local of 40 cents to Gauley and the Chesapeake & Ohio's local from Gauley beyond, which, in the case of Richmond, Va., for example, is $1.50, resulting in a total combination rate to Richmond of $1.90. The rate from Chesapeake & Ohio mines to Richmond is $1.60.

Complainants contended that this 30-cent differential against them practically closed these markets, and they accordingly requested the Commission to establish through routes and joint rates from the Kanawha & Michigan stations to the Eastern and Southeastern destinations in question, asking that as reasonable rates for such through routes the Commission prescribe the rates applied to these destinations by the Chesapeake & Ohio for the movement from its own mines over its own line. The Commission decreed the establishing of the through routes and held that the Chesapeake & Ohio rates would be reasonable rates to apply to the through routes composed of the two roads, the Kanawha & Michigan to Gauley and the Chesapeake & Ohio beyond.

In reargument counsel for the Chesapeake & Ohio repeats a contention which was urged from the outset of the proceeding to the effect that the complainants' case was one solely of discrimination. This attempted limitation of the issues clearly was not sustainable upon the record, and the Commission in effect so held in its original report.

Further discussion of the point would seem to be unnecessary were it not for the insistence and emphasis with which it has been continuously advanced. It seems abundantly clear that on grounds quite apart from their charges of discrimination predicated in the main upon the alleged association in interest between the Kanawha & Michigan and Chesapeake & Ohio, the complainants were petitioning the Commission to establish through routes and joint rates.

While they were avowedly seeking the Chesapeake & Ohio's existing rates for competitive reasons, complainants also distinctly proposed these rates as the measure of what would be reasonable joint rates to apply to the through routes they were seeking. Counsel objects to the Commission's decision on the ground that while it found that the charges of discrimination were not proven, it gave relief as though for discrimination.

In passing upon the contentions thus offered, the Commission after a review of the whole situation, says:

Renewed examination of this matter has not made it entirely clear that the through routes would in all cases necessitate an extra switching movement which would not be required in the case of the single movement over the Chesapeake & Ohio from its own mines. On the ground, however, that as a general rule there would be this additional expense, taken in connection with the consideration of the two as against the one line haul, we are of opinion upon reconsideration of the case that there may properly be a slight difference between the rates applicable to the through routes and to the single movement on the Chesapeake & Ohio. This difference should not exceed 5 cents per ton.

Congress to Investigate Southern Coal Trust

Congress has at last reached the point of investigating the charges relative to the alleged establishment of a Southern coal trust and has just begun the work of inquiry through a special committee of the Senate of which Mr. Bryan, of Florida is chairman. The inquiry is based upon charges made by B. L. Dulaney, of Bristol, Tenn., that the Pennsylvania system and its allied lines have undertaken to control shipments from southern coal fields in the interest of the so called "coal trust."

The first witness summoned before the Committee was Mr. Dulaney himself. He will be accompanied by F. C. Wright, a railroad rate expert who is to make an analysis of the coal rates that are now complained of by coast cities south of Norfolk. The claim has been that north Atlantic ports between Norfolk and New York get coal shipments which would normally be sent to tidewater at Charleston, Jacksonville and other ports.

It is believed that the investigation will broaden into an inquiry as to the relationships between the coal fields in Tennessee, West Virginia, Virginia, Kentucky and Pennsylvania on the one hand and the various railways running through those states. Officials of the roads have been asked to appear and among those who are expected are the presidents or general managers of the Atlantic Coast Line, the Chesapeake & Ohio, the Seaboard Air Line, and the Southern Railway.

It is possible that legislation may be urged as a result of the investigation or if not that the Interstate Commerce Commission may be directed to take up the matter and correct the alleged discriminating rates, if it should be concluded that nothing further in the way of legislation is desirable or necessary.

HARRISBURG, PENN.

It is reported here that indictments were filed on July 13, in the United States Court at Rochester, N. Y., against the Pennsylvania R.R., the Northern Central Ry., the Delaware, Lackawanna & Western R.R. Co. and the Delaware, Lackawanna & Western Coal Co.

All the indictments relate to transactions in connection with the mining of anthracite coal in Pennsylvania and transportation to Buffalo and vicinity, and allege unfair advantages by the railroads over other shippers.

The four companies are liable to fines of more than $1,000,000 if convictions are obtained.

The indictment against the Pennsylvania charges violation of the commodities clause of the interstate commerce act. Under this clause railroads are forbidden to transport commodities which they own, not required by them in their own business. It is the second criminal case under this act.

The indictment charges that half a dozen coal mining corporations ostensibly separately incorporated and which ship all their coal over the Pennsylvania system, are really owned, operated and financed directly by the Pennsylvania R.R. Co. The indictment contains 25 counts, the maximum penalty under the law for each violation being a fine of $5000.

The indictment against the Northern Central Ry. charges that it leased coal lands near Shamokin, Penn., to the Mineral Railroad and Mining Co., at a rental in the form of a royalty of 28 cents a ton, and that while the mining company has been mining and shipping a million and a half tons a year, the railroad company never has collected a cent in royalties.

The government alleged that by reason of this situation there was a discrimination in favor of this particular shipper. The indictment contains 50 counts, the maximum penalty for each violation being a fine of $20,000.

The Delaware, Lackawanna & Western R.R. Co. was indicted for granting concessions to the coal company of the same name on shipments of anthracite, while the coal company was indicted for accepting such concessions. While the word "concession" was used, it was explained that this was one and the same as granting rebates.

It is also alleged that the Delaware, Lackawanna & Western R.R. Co. owns five coal trestles in Buffalo which are worth $185,000. It is charged that the road expends annually for repairs and taxes $6000 on the property. It rents the trestles to the Lackawanna Coal Co. for $48 per annum. Because of this low rate the charge of making an illegal concession is made.

Improvements to Philadelphia Harbor

Within the next 30 days the largest vessels in the coal trade will be able to load safely full cargoes at the Greenwich Coal Piers at Philadelphia. It is said by the Department of Wharves, Docks and Ferries that the bar at the entrance to these piers, which in the past has been a menace to shipping, would be removed by Aug. 15.

For a number of years the shipping interests of this port made repeated efforts to have the bar removed, but without avail. The trouble arose over its location. As it is situated west of the 30-ft. channel, it did not come under the jurisdiction of the army engineers, and, as it is beyond the pierhead line, the city of Philadelphia was not responsible for its removal.

The determination to remove this bar was caused indirectly by a large shipping concern outside of the state. Last April the New England Coal & Coke Co., of Baltimore, wrote to the Maritime Exchange and asked if vessels 500 ft. long, 56 ft. wide and drawing 27 ft. could load safely at Greenwich and Port Richmond coal piers at any stage of the tide. The exchange replied that they could not on account of the bar just opposite the Greenwich pier.

After this the matter was dropped for some time. It was taken up later by the Joint Executive Committee on the improvement of the Harbor of Philadelphia and the Delaware and Schuylkill rivers. It eventually was referred to the Department of Wharves, Docks and Ferries. This department took the matter up with Colonel George Zinn, in charge of the United States Engineers' Office, in Philadelphia. Colonel Zinn promised to remove this bar, and about a month ago started two dredges working. Assistant Director John Meigs of the Department of Wharves, Docks and Ferries, on July 13, notified the Maryland concern that by Aug. 15 large vessels could load safely at the Greenwich piers at any time.

Shippingmen state that they look for a big increase in the coal trade of Philadelphia when it becomes generally known that this bar has been removed.

PENNSYLVANIA

Anthracite

Beaver Brook—The abandoned washery at the Beaver Brook colliery, which has been out of service for the past few years has been torn down. The best of the material will be utilized for other purposes, while the poorer class will be disposed of for fire wood to the residents of the town.

Luzerne—According to the report of the national auditors of the United Mine Workers of America recently made public, District No. 1 of the Anthracite region has a balance on hand in its treasury of $75,643.67. Two years ago the balance was only $12,618 and last year $52,640.68. Never has the union been so well financed and so strongly organized.

Freeland—The arrest of several coal pickers by officers of the Lehigh Valley Coal Co. has had a telling effect on the people who pick coal on company property, and the banks and strippings hereabouts present a deserted appearance. The recent crusade waged by the police officers of the company was marked by the consfication of a number of vehicles used to haul coal by the coal pickers.

Scranton—All the lower veins of the Pine Brook mine of the Scranton Coal Co. are filled with water as a result of the storm on July 10, and between 600 and 700 men are out of work as a consequence. Officials of the company stated that operations will not be resumed for about two weeks.

Yorktown—A cave occurred on July 14, near the road leading from Beaver Brook to Yorktown, caused by an internal disturbance in the old Yorktown mines. A force of men were put to work filling the cavity for several days. The surface surrounding the cave is all cracked and may yet disappear.

Audenried—As a precaution against possible accidents, the Lehigh & Wilkes-Barre Coal Co. officials have given orders against the backing of cars or trains, making it imperative that the engine be in advance. This will lessen the possibility of accidents and make it safer to all concerned. The safety-first idea is being applied to all branches of industry, and the Lehigh & Wilkes-Barre Coal Co. is doing its share to put it into execution.

Bituminous

Connellsville—More than $6000 worth of garden truck will be raised at the Leisenring No. 1 plant of the H. C. Frick Coke Co. this year, according to the judges who on July 13 inspected the lawns and gardens of the employees and awarded three prizes in each class. The judges expressed regret that the prize list was so limited, and specifically mentioned 17 persons as entitled to credit for what they have accomplished.

Lilly—Independent miners of this place on July 15 announced that they would oppose the formation of a branch of the United Mine Workers of American in that town. President Patrick Gilday, of District No. 2 of the United Mine Workers, has completed plans for the starting of a branch at Lilly, and a charter has been applied for. The arrival of the charter is expected to be the signal for the opening of a battle that may have serious consequences.

WEST VIRGINIA

Charleston—The recent explosion of a keg of powder in the mine of the Olcott Coal Co. at Dungriff resulted in serious injuries to 13 miners, three of whom may not recover.

Ansted—The mines of the Gauley Mountain Coal Co. have been compelled to shut down on account of inability to secure enough water for the use of the boilers. Every available supply of water has been exhausted during the prolonged drouth, and even the electric-light plant is stopped leaving the town in darkness.

Fayetteville—Two strikes at New River mines were called recently on account of local grievances. At Elverton about 80 miners quit because of the company's refusal to employ a certain man as check weighman. The company did not consider him competent, and declined his employment after he was duly elected by the miners. At Kaymoor No. 2 mine the men quit because of the company's employment of Howard Wilson. He is objectionable to the miners because he has been employed as a guard at Loop Creek mines and is charged as being a member of the Baldwin force of detectives. About 50 miners went out.

KENTUCKY

Whitesburg—The Elkhorn Coal Co. is getting in readiness to begin shipping coal from its new operation at the Mater-Kona station, on the main line of the Lexington & Eastern R.R. A mining town of some size is rapidly nearing completion.

The next grand jury, it is said, will be charged to inquire into the matter of cocaine selling, which, it is declared, has grown to large proportions, especially among the colored population. This traffic is charged with being responsible for a large part of the disorder which occurs in this section.

TENNESSEE

Chattanooga—The Baker mines, at Baker's station, on the Cincinnati, New Orleans & Texas Pacific R.R., have been taken over by the Conger Coal Co., organized in Chattanooga with a capital of $50,000. John E. Patton, Charles C. Moore, James M. Adams, George M. Price and J. H. McCallum are the incorporators. The mines have been in operation for several years and are considered of great value.

OHIO

Bellaire—The Cambria Mining Co., with its principal offices in Pittsburgh, has announced that it will start the Poultney and Webb mines shortly. Twenty armed guards will be placed on duty at the mines. It is believed to be practically certain that demonstrations will be made at both plants, and probably some violence will be offered by the Industrial Workers of the World. Fearing violence, several of the Union officials in this district have removed their families.

Massillon—The Goshen Valley Coal Co. of Massillon has taken leases on a large tract of coal land in Warwick and Goshen townships, Tuscarawas County. The leases were conveyed to the company by Frank Taggart, also of Massillon.

INDIANA

Kokomo—The Howard Circuit Court has ordered the mines of the Domestic Coal Co., near Brazil, sold. The company has been in the hands of a receiver, Harry Smith, Indianapolis, for more than a year. Appraisers have been appointed. The company was organized several years ago, J. E. Frederick, manager of the Kokomo Steel & Wire Co., having the controlling interest.

Terre Haute—A settlement has been reached between the operators and 250 miners of the five strip mines of the state, and the men are at work again. The scale of wages is to be left to a board of arbitration.

Sullivan—The Citizens mine, formerly owned by the Mönon Coal Co. and shut down for four years, has been reopened by the new owners and the No. 6 vein is being mined.

ILLINOIS

Herrin—Mine No. 7 of the Big Muddy Coal & Iron Co., which has been shut down for practically 18 months, is expected to resume operations in about 30 days. A new crusher is being put in and the plant overhauled. It will give employment to 500 men.

The properties of the Chicago & Carterville Coal Co. are both idle. A recent storm put mine A out of commission by blowing away the smokestacks and damaging the property otherwise, and it will be Sept. 1 before mine B, the top works of which were recently destroyed by fire, can be put in shape for operation.

MISSOURI

Creighton—Repairs are being made in the mine at Creighton, in Cass County, and actual producing probably will begin in the immediate future.

ARKANSAS

Prairie Creek—The tipples of three mines of the Mammoth Vein Coal Co., at Prairie Creek, near Hartford, were destroyed on July 17, following a six-hour battle between union and nonunion miners and guards. The damage is estimated at $200,000. The guards were routed by the union men, who, it is alleged, fired the surface plants.

KANSAS

Pittsburg—The Chamber of Commerce has decided to take a prominent part in exploiting coal and other products at the International Dry Farming Congress and Soil Products Exposition, to be held at Wichita, Kan., in October. Comprehensive exhibits showing the importance of the coal-mining industry, are planned.

Mineral—The strike of the Joplin & Pittsburg Ry. has continued without developments. Miners living at Mineral are walking from one to three miles to their work, others in the district being equally handicapped by the interurban tie-up.

TRADE CATALOGS

The Central Foundry Co., New York. "Valve, Service and Roadway Boxes." Twenty-three pages 3½x6¼ in.

The Electric Weighing Co., New York, N. Y. "Electric Conveyer Scales," Pamphlet of six pages illustrating and describing automatic weighing devices.

The T. L. Smith Co., Milwaukee, Wis., catalog No. 300 "Smith Mixer." Sixty-three pages 6x9 in. profusely illustrated, describing the construction and application of Smith mixers.

The Wagner Electric Mfg. Co., St. Louis, Mo. Bulletin 104 "Portable Instruments." Forty-seven pages 8½x11 in. illustrating and describing electrical testing instruments and their application.

PERSONALS

J. F. Smith has accepted the position of superintendent for the Montevallo Mining Co., at Aldrich, Ala.

Daniel Young, of West Scranton, Penn., has been appointed general superintendent of the Scranton Coal Co., to fill the vacancy caused by the promotion of W. L. Allen to the general managership of the firm.

William J. Murray, general manager of the Victor American Fuel Co., and Benjamin W. Snodgrass, mine superintendent at Delagua, Colo., have been nominated for membership in the North of England Institute of Mining and Mechanical Engineers.

A. J. Meek, of the Meek Coal Mining Co., aged 75 years, on July 14 suffered a stroke of paralysis, which rendered him speechless and helpless. Mr. Meek is also president of the Egyptian Coal & Mining Co., Merchants Exchange, St. Louis, Mo.

Dr. T. D. Scales, of Boonville, Ind., has given up his practice and is now an extensive coal operator in southern Indiana. He owns several mines about Evansville and Boonville and disposes of a considerable amount of their output in the Louisville market.

O. J. Patzold has been appointed sales manager for the La Follette Coal, Iron and Ry. Co., by George M. Shoemaker, manager of operations under Neil Robinson, receiver for the above named company. Mr. Patzold will have his office at the La Follette mines in Tennessee.

Daniel B. Torpy of Marietta, Ohio, has been appointed receiver for the Marietta, Columbus and Cleveland R.R., which runs from Marietta to Palos, on the T. & O. C. The suit for a receiver was filed by the Knickerbocker Trust Co., of New York, which held a mortgage on the property.

James W. Paul, former chief of the West Virginia Department of Mines, was recently granted letters patent for a portable signal apparatus to be used in coal mines. The device, should its use be adopted, would be a material factor in avoiding accidents inside the workings.

Arthur I. Young, for the last year, first-aid miner with the rescue car at Pittsburg, Kan., has been promoted to foreman in charge of the rescue station, with full charge of the local operations of the United States Bureau of Mines. Mr. Young succeeds H. D. Mason, Jr., who recently was transferred to Pittsburgh, Penn.

"Aunt Polly" Davis has come into the limelight of late by reason of articles in the Louisville papers containing her picture and that of her cabin in the midst of a 1000-acre farm which is exceedingly rich in coal and timber. She works the farm, with the assistance of a little help occasionally, although she is 82 years of age. She has $33,000 in the bank, but has elected to live a secluded life.

H. S. Gay, general manager of the Gay Coal and Coke Co., of Logan, W. Va., sailed this week from Boston for Scotland, where he will attend the Napier Tercentenary Celebration, an event to be held under the auspices of the Royal Societies of Edinburgh and London, and will read a mathematical paper entitled "The Approximate Determination of the Function of the Angle and the Converse." Mr. Gay is one of the two Americans who will read papers on this occasion. He has devoted much of his spare time during the past 20 years to the theories covered in the article, mathematics being one of his hobbies.

OBITUARY

Daniel H. Davis, banker, capitalist and one of the wealthiest men in Clay County, died at his home, Brazil, Ind., July 14. He was born near Cardhill, Wales, and came to America at the age of 17. He was a coal miner for several years at Scranton, Penn., and Knightsville, Ind., but went into the mercantile business and laid the foundation of a fortune now estimated at over $1,000,000. He organized two of the largest coal companies in the Indiana block coal field, and at one time was probably the largest producer in the state. He was an officer or director of several Indiana banks and trust companies and held appointive offices of importance from postmaster to trustee of public institutions.

Archibald F. Law, vice-president and treasurer of the old Temple Iron Co., which was dissolved recently by decree of the United States Supreme Court, died at his home, 1515 Adams Ave., Scranton, Penn., on the morning of July 18. He had been failing for some time and hope for his recovery had been abandoned. He was 59 years old.

Mr. Law was born in Scranton and began his career with the Lehigh Valley Coal Co., starting as weighmaster. In 1885 he became connected with the firm of Simpson & Watkins, colliery operators, and when that firm disposed of its properties to the Temple Iron Co. he became president of the Temple's subsidiary companies and vice-president and treasurer of the holding company.

Besides his connection with the coal mining business, Mr. Law was president of the Wyoming Electric Co., director and treasurer of the Mears Mining Co., of Joplin, Mo.; a director of the Title Guaranty & Surety Co., the Peckville National Bank, the Forty Fort Silk Co., the Scranton Trust Co. and the Lytle Store Co., of Minersville.

He was active in all the principal local social organizations, was a member of the Green Ridge Presbyterian Church and a 32d degree Mason. He leaves his widow and one son, Frank E. Law, a mining engineer, in Mexico. His only daughter, Mrs. Frank M. Rutter, and her husband were killed in a New Haven wreck about a year ago. In 1905 Mr. Law presented the town of Jessup with a 5000-volume library, which will now be known as the A. F. Law Memorial Library.

CONSTRUCTION NEWS

Ironton, Ala.—The Alabama Co. one of the largest coal and iron producers in the Birmingham district announces that it will re-line immediately its furnace at Ironton at a cost of approximately $20,000.

Dante, Va. — The Clinchfield Coal Corporation recently awarded the Roberts & Schaeffer Co., of Chicago, a contract for building a large Marcus coal tipple for installation at the Dante mine. The contract price was approximately $50,000.

Birmingham, Ala.—The Alabama & New Orleans Transportation Co. states that by Jan. 1, it will have on regular schedule at least 10, steel, self-propelling barges for transporting coal down the Warrior River to New Orleans. Seven are now in operation, and three more are building.

St. Clair, Penn.—Contractors have turned over to the Reading Ry. Co. a $300,000 auxiliary to the million-dollar, 75-track coal-shipping yard recently opened between this place and Mill Creek, in the shape of thoroughly equipped car shops. These have been building nearly two years

Sandusky, Ohio—The new loading machinery just installed at the new Pennsylvania docks in this city will be tried out in the course of a few days. This is part of the $1,000,000 dock improvements now under way in this city, which it is believed will make Sandusky one of the first coal ports on the Lakes.

Birmingham, Ala.—The American Tar Products Co. has located a site just north of the by-product plant of the Woodward Iron Co., and has engaged the entire tar output of the coke-oven plant out of which it will distill creosote and soft pitch. The present investment is $100,000, but this will soon be increased to $250,000.

Yolande, Ala.—The Yolande Coal & Coke Co., with mines at Yolande and Abernant, Alabama, anticipates making improvements costing between $25,000 and $30,000 on its plants, including the installation of motors at both places, the opening of a new slope at Yolande and the erection of a modern school house. Work has already been started on all of these improvements.

La Follette, Tenn.—The Vasper Coal Co. is contemplating an 800-ft. rock stope on a 33½-degree pitch to the Rex seam of coal on a tract leased from the Lindsay Coal & Land Co., of Knoxville, Tenn. When the coal is reached which will be within a few days it is expected that a modern plant will be installed. The Lindsay Coal & Land Co. has also just completed a slope to the same seam of coal at Careyville, for development purposes.

Birmingham, Ala.—The Pratt Consolidated Coal Co., the largest independent operating company in Alabama announces that it will build a fleet of steel barges for the purpose of conveying coal down the Warrior River to Mobile. Each barge will have a capacity of 500 tons, and three will be transported at a time by a tow boat, it being decided not to employ the self propelling barges at this time. The company already has a number of the latter type of coal boats, both at New Orleans and Mobile.

Floodwood, Ohio—Satisfactory progress on the construction of the huge power plant being erected by the Central Power Co. is being made. The large concrete foundations have been completed and the brick work will be rushed. It is the intention to push the transmission lines also so that when the plant is completed, about Nov. 1, the mines in the vicinity can be furnished with electric current. The company has 1000 acres of coal adjoining the plant. Fuel will be fed into the furnaces by gravity and the ashes will be removed in the same manner. The capacity will be 7000 hp.

NEW INCORPORATIONS

Leechburg, Penn.—The Valley Coal Co. has been organized with a capital of $20,000. The incorporators are Joseph G. Beale, E. H. Beale, Alfred Hicks, L. W. Hicks, and A. N. Hicks.

Ebensburg, Penn.—The Springfield Coal Co. has been organized with a capital stock of $25,000. The incorporators are, A. W. Evans, Harry Bell, and Leonard S. Jones, of Ebensburg.

Nashville, Tenn.—The Conger Coal Co. has been organized with a capital of $50,000. The incorporators are John E. Tatum, Charles C. Moore, J. M. Adams, George M. Price, and J. H. McCallum.

Pittsburgh, Penn.—The Clifton Coal Co. has been incorporated in West Virginia, with a capital stock of $100,000, by L. A. Bennett, Thomas Watson, J. J. Harter, George Shepard and R. M. Atkinson. The company will operate in West Virginia.

Pittsburg, Kan.—The Domestic Coal & Fuel Co., which will develop about 500 acres of strip and shaft coal lands in the Pittsburg field, has beeen formed. The capitalization is $100,000. A. H. Schlanger is president, other officers being George H. Mackie, vice-president, and C. M. Sweeney, secretary-treasurer. Sales and executive offices will be in the Globe building at Pittsburg.

INDUSTRIAL NEWS

Venice, Ill.—The coal chutes of the Chicago & Alton R.R., with several loaded coal cars and empties, were recently destroyed by fire, with a loss of approximately $20,000.

Coalfield, Tenn.—The Baker Coal Co. mine near Petros has been purchased from Ray M. Baker, of Rockwood, Tenn., by John E. Patton, president of the Sewanee Fuel & Iron Co., of Chattanooga.

Baton Rouge, La.—Thirty-one coal barges belonging to the Monongahela River Coal Co. sank here July 14, during a heavy rain storm. The coal was valued at $75,000 and a large force is now trying to raise the barges.

Birmingham, Ala.—Within the past few weeks, the Sloss-Sheffield Steel & Iron Co. has sold upwards of 50,000 tons of pig iron for delivery during the balance of the year. It has also closed contract with the Central of Georgia Railroad for 40,000 tons of coal for delivery during the next 12 months.

Charleston, W. Va.—The records in the office of Earl Henry, chief of the Department of Mines show that for the six months ending June 30, 1914, there were 370 fatalities. One hundred and eighty of these, however, occurred in the disaster at Eccles, this leaves 190 fatalities, with the mines running under normal conditions.

Lilly, Ky.—On July 27, E. G. Stooksbury, trustee for the creditors of the Ideal Block Coal Co., will sell at public auction the machinery and fixtures of the above named company, consisting of a steam shovel, steam boilers, pumps, electric hoists, Sullivan undercutting machines, coal cars, etc. This sale will take place at the mines about 2½ miles from Lilly.

Chicago, Ill.—The Illinois Pipe & Mfg. Co., of Chicago, has bought the entire surface plant of the Cardiff Coal Co., of Cardiff, Ill. This includes one steel tipple with its equipment, all boilers, hoisting engines, three sets of railroad scales, shaker engines, 400 coal cars, the rails in the mine and all equipment and supplies. These will now be offered for sale as second-hand equipment.

Columbus, Ohio—One of the effects of the settlement of the mining suspension in the Hocking Valley, Jackson, Crooksville and Pomeroy districts in Ohio is the resumption of work at the various railroad shops in order to get the coal cars in shape for traffic. Orders have been issued for resuming work at the shops of the Hocking Valley in Columbus and Logan and the Kanawha and Michigan at Hobson.

Columbus, Ohio.—The dissatisfaction which has been expressed by Ohio physicians with the manner in which their charges for medical attendance on injured workmen have been adjusted by the Ohio Industrial Commission is in a fair way to be settled, as the Ohio State Medical Association has appointed a committee, at the suggestion of the state authorities, to take the matter up and assist in arriving at an adjustment of the question.

Pittsburg, Kan.—The report of Eugene McAuliff, general fuel agent for the Frisco, for the fiscal year ending June 30, indicated that the coal tonnage on that road constituted one-sixth of the revenue tonnage. Several interesting points were discussed in the report. Mr. McAuliff asserted that a mistaken sentiment among operators that a car was loaded with coal when it is level full is evident. He stated that even when a car is crowned up, the load is still less than the capacity of the trucks.

Wheeling, W. Va.—After breaking all records for the amount of coal hauled in West Virginia and Kentucky for the fiscal year which ended June 30, the Chesapeake & Ohio Railway continues to keep up the high daily loading maintained last year. During the first ten days of July 579,920 tons were loaded in the fields mentioned, 41,200 tons of this being on the Big Sandy & Elkhorn road. This is an increase of 169,220 tons over the corresponding period of last yer, and indicates that 1914 will show a heavy increase over 1913.

New York City—The American Boiler Manufacturers Association will hold its 26th annual convention in New York on Sept. 1-4 inclusive, 1914. The headquarters will be established at the Waldorf-Astoria Hotel, and all boiler, tank, and stack manufacturers and fabricators of steel plates, also manufacturers and representatives of materials and supplies used by boiler makers are invited to attend the convention. A number of interesting papers will be presented and the subject of uniform boiler specifications will be thoroughly discussed.

Coal Trade Reviews

General Review

Heavy cuts in the anthracite circular and operations much curtailed. Down East bituminous market bordering on complete demoralization. Pronounced apathy in the Atlantic seaboard trade. Lake business is failing to show the expected form. Slow improvement in the Middle Western situation.

Further discouraging recessions have characterized the anthracite trade of the past week. The middle of the customary summer's dullness is at hand, with retailers placing only a few orders, and the situation further aggravated by delayed purchasing in all quarters. Heavy cuts in the circular are the rule, while both the individuals and large companies are reducing operations to nearly half capacity. A fair demand in the line trade, together with a large movement to the Northwest via the Lakes, are the only features preventing large accumulations at tidewater.

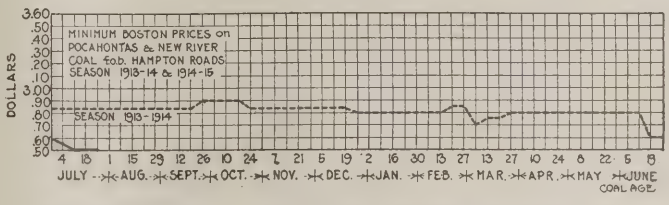
An almost complete demoralization prevails in the down East bituminous market. The situation has reached such a stage that a conference of the leading agencies was held at Boston to formulate a plan for rehabilitating the trade, and it was decided that the only corrective lay in a drastic curtailment program. Other Eastern distributing centers have failed to develop any features of a constructive nature, but the situation appears less acute and more along the line of the routine summer lethargy. There is no spot market, and the oldest operators report the dullest situation in years.

The long expected improvement in the bituminous movement from the Pittsburgh district, up the Lakes has failed to materialize, nor does there seem to be any immediate prospects for such. As a rule, tonnage figures are running close to those of last year, and consumers have little surplusses. Both spot and contract prices are subject to cuts. With the realization that the Ohio mines could not get under operation before Aug. 1, and even then only under a heavily curtailed capacity, a somewhat better tone has developed, particularly in the domestic grades. The Lake trade has proved decidedly disappointing so far, although preparations are being made to rush a heavy tonnage into the Northwest during the balance of the season. A distinctly better tone prevails as to the future.

The improving tendency in the Middle-Western market is being offset to a certain extent by the rapidly increasing production, and the delay in getting the crop movement under way. The demand is slow opening up and the disappointment is general throughout the trade. The labor scarcity, due to the heavy call for men in the farming districts, is interfering with handling the coal at the large distributing centers. The high-grade fuels are holding steady as a rule, and advances in the circular are scheduled for Aug. 1.

ATLANTIC SEABOARD

BOSTON



Efforts made to improve the price situation on Hampton Roads coals, but no result as yet. Pennsylvania grades in slightly better demand. Georges Creek still dull. Anthracite quiet.

Bituminous—Conferences have been held the past week to see if the ruinously low prices could be corrected at the various distributing points. So far, however, these efforts have shown no result. The local opinion is that the missionary work should be put in at the operating end and that conditions on Pocahontas and New River will get even worse unless a really drastic curtailment is enforced and further shipments of market coal are checked.

There are Hampton Roads cargoes at practically all the ports awaiting distribution orders and in varying degrees of distress. The trade here can hardly be said to feel optimistic. The only hope now is that sometime soon the West Virginia mines will close down for longer than a day or two, following the example of many of the Pennsylvania operations, and give the market a chance to tone up before the fall season starts in.

A large order for Cambria coal is understood to have been placed lately by the New Haven interests. This contract has usually been awarded to Pennsylvania shippers but Somerset County has heretofore furnished the bulk of the tonnage. A slightly better movement of the Pennsylvania grades is observed in several directions and orders are not quite so scarce as a fortnight ago. There is the same caution about sending coal to the loading piers without orders and doubtless that has been the means of keeping the standard coals from running down into low figures.

The Georges Creek situation is still dull but the prospect is opening up a little and better business is expected in August. Prices f.o.b. on this grade continue to be held very firmly.

Anthracite—Only a scattering business is offering on domestic sizes. The July 4 shut-down has been followed by another and there is no great surplus at any of the ports. Retailers here are only taking odd lots to patch out their storage.

Several anthracite barges are being tied up temporarily and it is getting to be difficult to secure orders. The consuming trade is not taking coal as early as in ordinary years.

Current prices on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahonta New Rive.
Mines*.....	$0.85@1.45	$1.20@1.60	$1.67@1.77	
Philadelphia*.....	2.10@2.70	2.45@2.85	2.92@3.02	
New York*.....	2.40@3.00	2.75@3.15	3.22@3.32	
Baltimore*.....	.....	.....	2.85@2.95	
Hampton Roads*.	.....	.....	.....	$2.50@2.80
Boston†.....	.....	.....	.....	3.10@3.58
Providence†.....	.....	.....	.....	3.15@3.63

* F.o.b. †On cars.

NEW YORK

Soft coal business down to an irreducable minimum. Operations heavily restricted. Heavy price cutting in the anthracite market. Some individuals are closed down for a full month.

Bituminous—The most searching review of the local soft-coal situation fails to disclose any important new features. The situation is no worse than it has been for the past several weeks, probably because there is little room for any further changes in that direction, but the long-expected developments of a constructive nature, which the market optimists have so consistently predicted, have still failed to develop.

The leading feature of the week has been the final closing of several more or less important contracts, including the American Locomotive, International Paper, General Electric and the majority, if not all, of the navy business. Contradictory reports are current regarding the contract of the New Haven subsidiary, but indications are that it has also been closed. Considerable railroad business is yet to be negotiated.

In the bunkering trade, business continues as slow as ever, vessels seeming to find it impossible to procure business due partially to the increased freight rates. This is also affecting export business. Some demurrage coal is appearing where operators resort to full time operations for certain compelling reasons unnecessary to mention. Although there is still scarcely any prompt business being negotiated, the market cannot be quotably changed for the past few weeks, which we continue as follows: West Virginia steam, $2.50@2.60; fair grades Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The hard-coal trade has experienced a week of further recessions and disappointments. Evidences of

heavy cutting on the part of individuals is seen in the report that a number of the independent collieries of the Erie R.R. have definitely suspended operations from now until the middle of August. While similar suspensions are the rule on the Philadelphia & Reading, the Pennsylvania and the Lehigh Valley, these are due to the strong demand for Lehigh coal for line shipments, and the light call for Wyoming and the free burning varieties. The abnormally heavy demand for the Lehigh grade all-rail has prevented accumulations at tidewater, but on the other hand the decreased demand for the Wyoming and free-burning varieties in the line trade have thrown heavy tonnages of these into the tidewater market and resulted in substantial cuts in the circulars.

Chestnut, the circular price of which is 25c. above stove, is now being quoted at less than the latter at tidewater; because of the light local demand chestnut is being diverted to the Cape and other down East points. Dealers report that the individuals are offering the best grades of Wyoming, egg and stove coal down to the April circular, while nut is quoted at $4.75@4.90. The steam grades are still relatively inactive, the better qualities moving at a slight reduction, but large concessions required to dispose of the off grades. A fairly good demand for pea coal in the line trade has prevented an abnormal accumulation at tidewater.

Mining operations are being conducted on about half-time basis. The market is now quotable as follows:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$4.90	$4.60@4.90	$4.85	$4.55@4.85
Egg	5.15	4.95@5.15	5.10	4.85@5.10
Stove	5.15	5.05@5.15	5.10	5.00@5.10
Chestnut	5.40	4.95@5.40	5.35	4.75@5.35
Pea	3.55	3.40@3.55	3.50	3.25@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.05@2.75
Rice	2.30	2.15@2.30	2.00@2.25	1.50@2.25
Barley	1.80	1.60@1.80	1.75	1.25@1.75

BALTIMORE

Business generally flat and discouraging. Prices largely a matter of immediate necessity. Exports still hold up the average.

While hoping and believing that a few more weeks at most will see an end of the depression, the agencies here characterize the present situation as one of the worst they have experienced for some years. Consumers are simply not taking the fuel. The day of pushing coal up on contracts is at an end, and there are numerous reports of surplus fuel at various points. There is little or no spot maket.

Under the circumstances the fixing of prices is rather difficult. There has undoubtedly been some sacrificing of coal where producers have been caught with too much on hand. But it is now not so much a question of price as it is to find the buyer. West Virginia coals Westward, are commanding a little better price than for Eastern consumption. Three-quarter gas has sold variously at from 80 to 90c. Lower grade Pennsylvania line coals still hold at from 85c. to $1, with better qualities ranging at from $1.15 to $1.35.

Coal exporting continues heavy, and this will undoubtedly help the tonnage handled over the local piers for export, coastwise and harbor use, to a point close to normal, if not in excess of that for last year up to the present time. The increasing demand from Europe for American coal is the telling factor. Coastwise business, South is expected to pick up from now until the middle of August.

The anthracite trade is quite flat.After the middle of August, however, there should be a period of more activity leading up to the real awakening in September.

The reopening of the Maryland Steel Co. works the past week proved an encouraging feature to the trade.

COAL CARTERS

Coal carters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tonnage	Rate
Mount Hope [1]		Baltimore	Calais	989	
Frankrig [2]	Danish	Norfolk	Barbados	876	
Flora A. Kimball [1]		Port Liberty	San Juan P. R.	321	$2.00
L. C. Anderson [1]		Philadelphia	Jacksonville	766	1.00
Whitgift [2]	British	Norfolk	Mediterranean	2842	
Sangstad [2]	Norwegian	Baltimore	Nipe Bay	1459	
Robt. P. Murphy [1]		Philadelphia	Galveston	572	
Tabor [2]	British	Norfok	Barbados	2392	

[1] Schooner [2] Steamer

HAMPTON ROADS

Dumpings for the week show some improvement. Demand still light on all grades. One collier loaded for U. S. Government. Bunker trade continues the leader.

Dumpings at tidewater for the week will show some improvement. Foreign shipments have increased and there also seems to have been some improvement in the coastwise movement. The number of steamers calling for bunker supplies has shown up fair but as has been the case for some time the demand for cargo coal is still light and a greater part of that moving has been on contract. Circular prices are being quoted but indications point to some cuts having been made by shippers who have more than a normal supply of coal on hand. The general accumulation of cars on the railroad yards is just about normal and while some of the suppliers have an excess quality on hand others hardly have sufficient to take care of contract business.

Practically all coal moving has been New River and Pocahontas mine-run with some small shipments of high volatile and nut and slack, the two latter grades moving to the New England market. Foreign shipments have gone to Santo Domingo, Canal Zone, Havana, Georgetown, Curacao, Naples, Brindisi, Venice, La Plata, Vera Cruz, Barbadoes, Trapani, Kingston, Para and Manaos.

LAKE MARKETS

PITTSBURGH

Lake shipments have not improved and are therefore disappointing. Line demand moderate. Production between 60 and 65% of full capacity. Prices still being cut on both prompt and contract.

Coal mining operations show no improvement in the past week and on the whole there has been little if any change for four or five weeks. It was fully expected that by this time there would be a decided increase in production. The first-half of the Lake shipping season was expected to be slow, but the second-half was expected to be good, making on the whole a fair showing for the season. At present there is no prospect of any measurable improvement.

The line demand has not increased and there is no immediate prospect that it will improve. The iron and steel industry is working at about 65% capacity and seems to be well satisfied that July has not brought an actual decrease in operations. Production of coal to the Pittsburgh district is at from 60 to 65% of full capacity. Some operators place the percentage higher, but evidently rest on the basis that operations at the full capacity are not really normal. Prices continue to be cut on both prompt and contract, particularly the former. Relatively little has been done in contracts the past week or two. Circular prices remain as follows: Slack, 80@90c.; nut and slack, $1.05; nut, $1.15; mine-run, $1.30; ¾ in., $1.50; 1¼-in., $1.50 per ton at mine, Pittsburgh district.

BUFFALO

Market continues slow but with a hopeful undertone. Sales are about equal to last year and operators are holding down outputs. Anthracite at the low point of the year. Lake shipments heavy.

Bituminous—There is about the same slow situation that has prevailed for some months, with reports from outlaying points indicating that the surplus stock in consumers' hands is still large. The consumers will not buy more than they need and some of them are not able to store any more than they have. Still the trade as a rule is very hopeful. When the car supply runs down next fall there will be improvement in the trade and probably not before. It will take more than a starting up of the idle mills to make all the coal men busy, much as it would mean to the business of the country.

Some of the shippers find their sales to be fully up to the figures of a year ago and they are looking forward to the time when a small additional increase will make business really good. The mine owner as a rule complains of poor prices more than anything else. Still the disposition is to keep putting out coal. There is only a small amount of unsold coal on track. When the market drops off there is always a large amount, but after the slow trade has continued a while the coal stays at the mines till sold. The experience makes shrewd coal men, no matter how little it is relished.

There is not much report of price cutting. Good bituminous brings full prices and other grades at what can be got for it. Quotations remain on the basis of $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack. Allegheny Valley slack is about on a par with Pittsbugh and sizes from 15 to 25c. less. Slack continues duller than sizes.

Anthracite—There is about as little selling at present as is ever the case. This is the heart of the dull season, when activity is never expected, but were it not for the Lake trade the mines would find it difficult to keep in operation and as it is some are running only about four days a week. Shipments for the week were 195,000 tons and but for the washouts in the Scranton district, that crippled the railroads for several days, the amount would have considerably exceeded 200,000 tons.

TOLEDO

Situation somewhat improved. Prices firm and there is more buying. Grave fears as to the strike situation in Belmont County.

The situation in Toledo is showing some betterment during the past week or so. The threshing coal demand has begun in earnest while a good many contracts are being awarded by school boards. The factories are still running light which is holding the steam-coal demand down somewhat and there is no better business in the Lake trade. It is expected that the Lake business will improve in the near future as there are signs of an upward tendency in the iron and steel industry.

Others are not so optimistic, being fearful of the conditions in eastern Ohio where matters have not improved during the past week. The I. W. W.'s are still busy at the mines, and although Governor Cox is making every effort to avoid sending the troops to the mining district it is feared by many that the situation may ultimately become as serious as in Colorado. The closing down of the mines has not really affected Toledo in the least as the shortage was easily made up by West Virginia. Prices have remained unchanged.

COLUMBUS

Domestic trade better, arrangements being made to stock when mines get under way. A heavy Lake business also anticipated.

Demand for domestic coal is growing stronger every day. Dealers stocks, which have been sufficient to the present time, are rather low and as business is good they are in need of Ohio coal. Arrangements are being made to stock up just as soon as the mines are placed in operation. There is a good tonnage of West Virginia coal coming into the state.

Steam demand is also working stronger. Many users of steam grades are using West Virginia fuel and may stock it in preference to Ohio coal. Railroad contracts will be taken up as soon as the mines resume operations. Considerable is expected of the Lake trade at that time also. Preparations are being made to rush a large tonnage of Ohio coal to the Northwest via the lakes.

Prices in the Ohio fields are:

	Hocking Valley	Pittsburgh	Pomeroy	Kanawha
Rescreened lump	$1.60		$1.65	$1.50
1¼ inch	1.50		1.50	1.40
¾-inch	1.30	$1.20	1.35	1.30
Nut	1.25		1.25	1.20
Mine-run	1.10	1.05	1.15	1.10
Nut, pea and slack	0.70		0.75	0.65
Coarse slack	0.60	0.60	0.65	0.55

CINCINNATI

Domestic demand is slowly improving but is still hampered, by the light consumption of steam grades. However a distinctly better feeling prevails in all quarters. The Lake movement is also below par, the volume handled to date being far below the average figure.

In spite of the adjustment of differences in the Kanawha and parts of the Ohio fields, there appears to have been no general resumption of work; and yet, with low production still the rule, the market continues decidedly sluggish, save for the normal demand for smokeless. Splint and Eastern Kentucky domestic coals are in fairly good call, but nothing out of the ordinary, and inasmuch as the industrial situation has not improved lately, operators are finding it difficult to dispose of any quantity of screenings.

However, the trade in general is thoroughly convinced that a general awakening in demand is coming very shortly. While the car supply at present is more than ample, it is rapidly falling off in some quarters, due to the demand from the wheat-growing sections. As a general industrial call for cars is anticipated, following the expected business revival, the situation may be such within a few weeks that all grades of fuel will be at a premium. At present prices are only fair, both for spot delivery and contract.

The Lake demand is proving very disappointing, and operators are more and more of the opinion that large quantities of coal were carried over from last season. Nearly all members of the trade selling coal for the Lakes report that their business is much below last year, and as the season is now well advanced the total volume handled will be abnormally small.

CLEVELAND

Inquiry for slack has brought a slight advance. Receipts are light largely because mines are making less coal. Lake conditions show slightly decreased traffic. Deadlock still prevails in the labor trouble in the No. 8 district.

There is a fair demand for slack at prices ranging from $1.65 to $1.70. Receipts, which were expected to be heavy over last Sunday, were light and the market is temporarily able to hold its own. Lake shipments are somewhat smaller than they have been owing to the large stocks. As slack is made from three-quarter screenings the light shipments of Lake coal has somewhat curtailed the output.

Cambridge operators are quoting run-of-mine coal at $1.02½ to $1.05, at the mines, subject to 90c. freight rate into Cleveland. The first coal will probably be shipped before the end of the week, but it will be toward the middle of next month before the prepared sizes can be offered. No quotations on anything except mine-run have been reported so far.

Coarse coals are much more plentiful than the market warrants and shading is quite common. High-grade coals from Pennsylvania and West Virginia are offered freely, and cancellations on Fairmount are being made. The reopening of Cambridge mines is the real cause of these cancellations, as they are coming from factories using that coal. The difference in freight rate between Cambridge and the Fairmount field to Cleveland is 25c. a ton. The consumers also prefer the local product.

No. 8 mines are no nearer operation than they were a week ago. The warlike action of the southern European miners has caused much trouble in the miners' union and the chances of making a settlement are small at this time.

The Lake trade shows a slight falling off, principally because of dock congestion. Practically all of the space devoted to coals other than those mined in Ohio is full. Reservations have been made for Ohio coal and Hocking and Cambridge will be delivered in large quantities early in August. Shipments from upper Lake docks will be better after the middle of next month, as new grain will begin to arrive at the Lake front at that time.

Quotations for shipments are as follows:

	Pocahontas	Youghiogheny	Fairmount	W.Va. No. 8
Lump	$3.60			
Lump, 1¼ in.		$2.35		
Lump, ¾ in.		2.20	$2.05	$2.05
Egg	3.60			
Mine-run	2.60	2.10	1.95	2.00
Nut		2.15		
Slack	2.20@ 2.35	1.65@ 1.70	1.65	1.65@ 1.70

COKE

CONNELLSVILLE

Coke market entirely stagnant and prices possibly a shade easier. Production in the first-half of the year equal to 80% of the production rate in the three best years.

Signs of an improvement in coke, which appeared last week, have not resulted in anything tangible, and the market is as dull and stagnant as at any time. Offerings of small lots of prompt coke have been made at less than $1.75, which has hitherto been considered the minimum of the prompt market. It is said, however, that no large tonnage could be picked up even at $1.75. Consumers appear to be well covered and no activity is to be expected until about Aug. 1, when a few furnaces will have to cover August requirements. We quote: Prompt furnace, $1.75@1.80; contract furnace, $1.90@2; prompt foundry, $2.25@2.35; contract foundry, $2.35@2.50, per net ton at ovens.

The "Courier" estimates shipments from the Connellsville and lower Connellsville region in the first half of the year at 8,150,000 net tons, or at fully 80% of the maximum rate maintained for any full year, the years 1906, 1912 and 1913 all having shown about 20,000,000 tons for the full year. Production in the week ended July 11 is given at 264,605 tons, an increase of 5333 tons, and shipments at 257,107 tons, a decrease of 15,795 tons.

BUFFALO

It is still impossible to find anything favorable in the coke market. The dealers are positive that the market is still weakened. They are able to obtain former prices, based on $4.25 for best 72-hr. Connellsville foundry, but the sales are so unsatisfactory that jobbers are steadily going out of the trade. It seems to be that the slow movement enables the consumer to find more time to complain of his purchases than if business were active.

CHICAGO

A number of contracts are being signed for both furnace and foundry coke to be delivered during the last half of the year. The price fixed for most of the coke is $5 f.o.b. Chicago. This is on the basis of $2.50 f.o.b. the ovens at Connellsville. In some districts foundry coke has sold at $4.85, or, if the business was specially good, at a slightly lower figure. There has been a drop of 25c. a ton in the price of furnace coke. Quotations are:

Connellsville and Wise County, $5; byproduct, egg, stove and nut, $4.75; gas house, $4.25.

MIDDLE WESTERN

INDIANAPOLIS

Mining conditions not so satisfactory. Crop movement only beginning and railroads have not yet increased their purchases of coal. Mines doing about half-time, but an improvement is anticipated later, when domestic grades begin moving.

Coal operators express disappointment that conditions have not shown greater improvement, in fact, appear to have receded slightly. It was expected the movement of grain would increase the railroad buying, but this seems to be only starting and the coal business has not yet derived any benefit. It is not thought there will be any shortage of cars, on account of the large number idle.

Mine operations have been reduced until it is doubtful whether the general average is half-time. Some operators say there is just demand enough to avoid suspension, and that some coal is being sold at cost to keep the mines running. One large colliery has had only four days' work in two weeks. William Houston, president of the Indiana Mine Workers, says 4000 out of the 20,000 miners of the state have not had work since March, when the mines ceased operating at full capacity. Some improvement will naturally come in August when domestic grades begin to move to retailers' yards. In fact there is some buying of this kind now, as retailers do not guarantee present prices beyond Aug. 1. Consumers will be expecting an advance Sept. 1 and there will be increased demand to get coal into their bins before that date. Retailers have seemed to get better results this year than formerly in trying to stimulate summer demand.

CHICAGO

Labor scarcity, due to large crops, interfering with handling of coal. Domestic trade slow. Advances in some circulars scheduled for Aug. 1.

Scarcity of labor in the country districts is the controlling factor in the present slump in the domestic coal trade. Attracted by the high wages offered by farmers, workers have gone to the harvest fields and rural dealers find themselves without sufficient help to unload coal into their bins. These dealers realize that unusually advantageous prices now prevail, but state they will be unable to handle their supplies until late in August.

Carterville operators find it impossible to dispose of much coal to the domestic trade and are crushing their larger sizes and selling it to steam users. Mines in this district which have been attempting to sell to the domestic trade are working only a few days a week. In the Franklin County field operators are finding it difficult to maintain the new circular price of $1.50 on domestic sizes and some of the smaller producers have been compelled to make cuts in the circular. Springfield operators report that there is scarcely any demand for domestic coal; about half of the mines are in operation with a record of four and one-half to five days a week.

There will be an advance in the smokeless circular on mine-run Aug. 1, from $1.25 to $1.40. Orders are now being freely placed by retailers who wish to take advantage of the lower figure. Smokeless lump and egg continue scarce. It is reported that the shipments of Hocking coal will be resumed within a few days.

Prevailing prices in Chicago are:

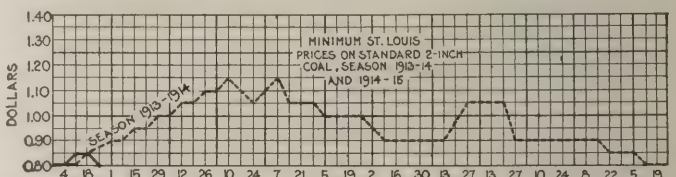
	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump	$2.07	$2.40@2.55	$2.12	
Steam lump	1.97		1.97	
Egg		2.40@2.55		$4.05
Mine run	1.87	2.15@2.25	1.87	3.30
Screenings	1.57@1.67	1.85@1.95	1.57@1.95	

Harrisburg quotations are: Domestic lump and egg, $2.40; steam lump, $2.25; mine-run, $2.15@2.25; screenings, $1.85@1.95; No. 1 nut, $2.55; No. 2 nut, $2.40.

Prices for Carterville coal are: Lump and egg, $2.40; No. 1 washed $2.55; No. 2 washed, $2.45.

ST. LOUIS

Improved tone to the better qualities in the high-grade field. Washed coal market weak. Mining operations in the standard district increasing and higher prices expected shortly.



A slightly better tone in the high-grade market has been noticeable in the past week. This, of course, applies to the better grades. There are still some coals from West Frankford and from Williamson County that are down to $1 and $1.05 for lump and egg, but on the whole there is a tendency towards better prices, with a slightly increased demand. One of the largest companies in the field, closely allied in the past with the Missouri Pacific holdings, is concentrating domestic sizes for the season at $1.35. This is considered suicidal by other operators. The washed market is still weak.

In the Standard field 75c. is the basis for screenings, 2-in. lump, and mine-run. The demand has not increased to any extent for this grade of coal, although some of the mines are gradually resuming operations, which keeps the market flooded. It is likely that Standard fuels will start to pick up a little in the next week or ten days on domestic sizes, and the market on screenings can be expected to drop.

Anthracite, smokeless, and coke are exceptionally dull, with the first two usually under demurrage at East St. Louis.

The circular is:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	.....	....	$1.20	$0.80@0.85	$0.95
3-in. lump	.....	....	.....	....	.....

KANSAS CITY

The big wheat yield creates favorable sentiment and the market is excellent.

Business is good in Kansas City, sales offices of various mines reporting a brisk demand from the Southwest. The wheat crop has aided both directly and indirectly in stimulating the demand for coal. Future bookings are coming in briskly. A feature of recent demand has been contracts from municipalities in both Missouri and Kansas. Many are now arranging for their fuel supplies for the next year and indications are that fall trade will be unusually brisk. Dealers are inclined to load up because of the big wheat yield. Mines in Kansas are handicapped somewhat by an interurban strike, but production is continuing in good shape.

PRODUCTION AND TRANSPORTATION STATISTICS

CHESAPEAKE & OHIO RY.

The following is a comparative statement of the coal and coke traffic from the New River, Kanawha and Kentucky districts for May and the eleven months ending May 31, 1912 and 13, in short tons:

	May				Eleven Months			
Destination	1914	%	1913	%	1914	%	1913	%
Tidewater	298,180	17	284,109	20	3,238,342	19	3,277,754	23
East	187,432	10	155,872	11	2,389,123	14	2,357,236	17
West	1,224,767	67	908,536	62	10,361,424	61	8,153,781	56

Coke	31,040		29,438		359,360		285,459	

VIRGINIAN RAILWAY.

Total shipments of coal over this road for May of the current year amounted to 359,879 tons as compared with 342,843 tons for the previous month.

PENNSYLVANIA RAILROAD ....

The following is a statement of shipments over the P. R.R. Co.'s lines east of Pittsburg and Erie for June and the six months of 1913 and 1914, in short tons:

	June		Six Months	
	1914	1913	1914	1913
Anthracite	855,247	776,237	5,654,277	5,418,231
Bituminous	3,897,544	4,189,969	23,555,182	24,282,419
Coke	793,463	1,161,521	5,227,885	7,386,908
Total	5,546,254	6,127,727	34,437,344	37,087,558

IMPORTS AND EXPORTS

The following is a comparative statement of imports and exports in the United States for May, 1913-14, and for the eleven months ending May, 1912-13-14, in long tons:

	11 Months			May	
Imports from:	1912	1913	1914	1913	1914
United Kingdom	6,691	8,750	10,684	200	551
Canada	963,033	1,255,854	938,182	74,638	55,410
Japan	13,165	78,812	83,851	12,315	410
Australia and Tasmania	182,266	140,825	230,081	10,840	3,136
Other countries	1,992	3,257	3,613	.....	183
Total	1,167,147	1,487,498	1,266,411	97,993	59,690

Bunker coal	6,525,093	6,666,494	7,124,527	690,228	674,805

SOUTHWESTERN TONNAGE

The following is a comparative statement of the Southwestern tonnage for February of the years 1913 and 1914:

State	1913	1914	Increase	Decrease
Missouri	260,586	259,270		1,316
Kansas	414,413	492,304	77,891	
Arkansas	130,888	113,354		17,534
Oklahoma	297,004	257,162		39,842
Totals	1,102,891	1,122,090	77,891	58,692

This statement only covers the tonnage of members of the association, which is estimated to be at least 95% of the entire production.

NORFOLK & WESTERN RY.

The following is a statement of coal handled by the N. & W. Ry. during June and the past four months of the current year in short tons:

	March	April	May	June
Pocahontas Field	1,161,793	1,156,670	1,239,653	1,245,440
Tug River District	246,490	221,344	263,155	244,342
Thacker District	274,786	232,181	280,148	261,248
Kenova District	88,616	96,116	101,768	97,352
Clinch Valley District	153,704	156,502	150,916	156,028

All other railroads	140,123	171,818	225,561	232,387
Grand total	2,112,118	2,117,286	2,338,672	2,315,956

COAL FREIGHT DECISIONS

Investigation and Suspension Docket No. 344—Coal rates from Oak Hills, Colo.

Proposed joint rates of the Denver & Salt Lake R.R. Co. and Chicago, Rock Island & Pacific Ry. Co., for the transportation of bituminous coal from Oak Hills, Colo., to destinations on the line of the Rock Island found not to be justified, and Walsenburg district basis of rates via the Rock Island to the same destinations ordered in lieu thereof.

I. C. C. No. 5702—American Coal & Supply Co. vs. Chicago & Northwestern Ry. Co. et al.

Defendants' through charges for the transportation of soft coal from Indiana mines to Terra Cotta, Ill., via Chicago, found on the facts of record not unreasonable. Complaint dismissed.

I. C. C. No. 5336 and Sub. Nos. 1, 2, 3, No. 5358 and Sub. No. 1.—McCaa Coal Co., Elliott Splint Coal Co., Gilmer Consolidated Coal Co., Queen Shoals Coal Co., Morris Fork Coal Co. and and Elk Manor Coal Co. vs. Coal & Coke Ry. Co.

1. In the distribution of coal cars during car-shortage periods the defendant arrived at the mine rate by adding to the estimated physical capacity the commercial capacity taken for the twelve-month prior period, dividing the result by two; **Held,** That in the instant case this method permits of discrimination and defendant will be required to distribute cars hereafter on basis figured on the average shipment per days worked by the mines located on its line taken for a two-year period prior to January 1, 1913.

2. The proper distribution of cars is a question of fact to be determined according to the circumstances and conditions existing in each particular case.

FOREIGN MARKETS

GREAT BRITAIN

July 10—The market is still quiet for prompt and firmer for ahead. Prices about unchanged.

Approximate quotations:

Best Welsh steam	$4.80@5.04	Best Monmouthshires	$4.08
Best seconds	4.38@4.40	Seconds	3.84@3.96
Seconds	4.14@4.26	Best Cardiff smalls	2.58
Best dry coals	4.20@4.32	Seconds	2.46

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those of Monmouthshire descriptions are net f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.

Coke is quoted at: Special foundry, $6.72@6.96; good foundry, $5.04@5.76; furnace, $4.32@4.80.

Production and Imports in Chile for 1913—The estimated production of coal in Chile for 1913 is put at 1,400,000 tons, of which the greater portion was consumed in the country. The production in 1910 was 999,918 tons, which shows an increase, but not equal to the larger consumption.

The importation of coal for 1913 was 1,218,840 tons, against 1,428,181 tons for 1912. This decrease is accounted for by the increased use of fuel oil in the nitrate fields of the north, and an increased consumption of native coal. Of the imports the United Kingdom supplied 577,795 tons, Australia, 637,310 tons, and the United States the remainder. It is generally understood in Chile that the United States will get a greater proportion of the coal trade on the opening of the Panama Canal, when the shipment of large quantities of iron ore to the United States will provide a large tonnage for this trade. When normal conditions return there will be a largely increased demand for fuel in Chile, and it would be well for American interests to be prepared for the greater market.

Coal Imports into Smyrna, Turkey—The entire amount of coal imported into Smyrna, from all sources, is about 203,500 tons annually, as follows: From England (Newport, Cardiff, Newcastle), 50,000 tons at $6 to $7.30 per ton; from Germany (Westphalian mines) 2000 to 5000 tons at $5.82 to $7 per ton; from Black Sea regions, 150,000 tons at $4.40 to $7.30 per ton. The Black Sea grades, being from Turkish mines, are free of duty. Coal from all other sources pays the regular Turkish duty of 11 per cent. ad valorem, which, with local dues and other expenses, amounts to about 13 per cent. An effort has been made to introduce American coal on this market. A local steamship company, flying the American flag, has been induced to give space in its warehouse for carrying the necessary stock, and trial orders for a railroad and for the gas company have been sent in.

Hongkong, China—The importation of coal in Hongkong during 1913 was the heaviest in the history of the port, the large volume being due to the large shipping tonnage entering and clearing and the increasing use of fuel industrially. The total imports for the year amounted to 1,487,750 tons, compared with 1,240,144 tons in 1912 and 1,261,672 tons in 1911. There were increased importations of Chinese coal for use locally and for reshipment to Canton. Indo-China shipments also showed notable increases, but otherwise the trade remained about the same as in recent years. Japan furnished 1,023,564 tons, Fushun, 125,608 tons, Kailan, 119,794 tons, Indo-China, 171,474 tons, Cardiff, 38,560 tons, Borno, 5250 tons, and Tsingtau, 3500 tons. The market showed a rising tendency during nearly the entire season, contracts for the new year being made at advances of from 50c. to $1 per ton.

Financial Department

Consolidation Coal Co.

President J. H. Wheelwright, of this company, reports, in part for year ended Jan. 1, as follows:

Tonnage—The mines of the company in 1913 produced 11,157,989 net tons, compared with 10,347,100 net tons in 1912, as follows:

COAL MINED BY THE COMPANY AND ITS SUBSIDIARIES, BY DIVISIONS

	Maryl'd.	W. Va.	Penna.	Mill Cr.	Elkhorn	Tot. Gross	Net Tons.
1913	2,127,131	4,656,640	1,743,536	459,202	973,302	9,959,811	11,157,989
1912	2,162,996	4,576,484	1,748,091	522,900	228,011	9,238,482	10,347,100
1911	2,178,391	3,925,329	1,671,639	456,544	.....	8,231,903	9,219,731

The coal mined by lessees in theMaryland, West Virginia and Pennsylvania divisions aggregated 537,871 net tons, against 600,769 in 1912.

Floods—The disastrous floods in the Middle West in March last destroyed many miles of railroad track, practically suspending through railroad traffic for several weeks, and months elapsed before transportation companies were again in normal condition. Although our mines and the transportation facilities locally escaped any direct damage by the floods, our production and shipments for the year were curtailed at least 1,000,000 tons.

Elkhorn Field—The development work in the Elkhorn field in eastern Kentucky, which has been in progress during the past 2½ years, is rapidly approaching completion, and at this date 14 mines have been opened, with an aggregate producing capacity of from 12,000 to 13,000 tons daily, or approximately 2,500,000 tons per annum. Tipples and mine buildings have been completed, mines equipped with the most modern mining machinery, all with a capacity for handling a tonnage largely in excess of the present developed capacity of the mines. The central-power plant located at Jenkins furnishes electric current for operating and lighting purposes at all of the mines, both at Jenkins and McRoberts.

Modern brick buildings, such as hospital, school houses, bakery, drug store, post office, general office, etc., have been completed, as well as dwellings for employees. Therefore, all extensive development work in this field is behind us. To increase the production from now on is a question of additional employees and from time to time the construction of additional dwelling houses for their accommodation. The coal is uniformly of the highest quality of byproduct coal produced in the United States.

Miller's Creek—The development of an additional mine was begun during the past summer some two miles from the present mines, to which point the Millers Creek R.R. has been extended. This mine will be equipped with most modern equipment, its production now being about 300 tons daily. When fully developed the mine will produce about 1800 tons daily; 100 miners' houses have been completed and a substation is in operation. The central-power plant at West Van Lear generates electricity for operating all of the mines in this district.

Jenner Field, in Pennsylvania.—A new mine has been located and the necessary shafts will be completed this summer. The mine is planned for a large production with most modern equipment.

Central Power Plant at Hutchinson, W. Va.—This plant was completed early in the year. Transmission lines and substations have been built; 25 miles are now electrically operated through 15 substations. Additional transmission lines and substations will be constructed this year, so that practically all of the other mines in the West Virginia division will be connected up during the year.

Capacity—The capacity of our various mines is now fully 50% above the present rate of production.

Convertible Bonds and Stock—While on Dec. 31, 1912, $14,956,000 of our first and refunding mortgage bonds were reserved for additions, betterments and improvements, and an additional $1,497,000 were in the treasury, the conditions of the bond market precluded the sale of bonds except at a prohibitory figure, and, therefore, as a means of procuring funds with which to carry on the development work in the new Elk Horn field, and to provide for other additions and betterments, your board early in Mar., 1913, issued $6,500,000 of its 10-year 6% convertible secured gold bonds, convertible at 105 of par into stock any time prior to Feb. 1, 1922.

RESULTS FOR YEAR ENDING DEC. 31 (INCLUDING SUBSIDIARIES)

	1913	1912	1911	1910
Coal mined	9,959,811	9,238,482	8,231,903	9,370,633

DIVIDEND ANNOUNCEMENTS

Lehigh Coal & Navigation Co.—Regular quarterly dividend, No. 143, of $1, payable Aug. 31 to holders of record, July 31.

Nova Scotia Steel & Coal Co., Ltd.—Regular quarterly on the common of 1½, and on the preferred of 2%, both payable July 15 to holders of record, June 30.

Central Coal & Coke Co.—Regular quarterly dividend of 1½% on the common, and 1¼% on the preferred, both payable July 15 to holders of record July 1 to 15.

Consolidation Coal Co.—Regularly quarterly dividend of 1½%, payable July 31 to holders of record July 23.

COAL AGE

Vol. 6 NEW YORK, AUGUST 1, 1914 No. 5

No matter how powerful the driving energy of a locomotive, it can only pull in proportion to the weight that rests upon its wheels. Take off the weight and the wheels will revolve, but the engine won't pull. *Experience* and *character* in a man are like the necessary weight in a locomotive. A man may have great power, but if he lacks character, he can't move any considerable load.

* * *

We hear a lot about the practical and impractical man. The former is one whose proposals can be accomplished *under existing conditions*. The latter is a person whose ideas can only be made effective by changing conditions. The practical man inquires—*what is best* to do under existing circumstances. The impractical fellow asks—*what is right*. The practical are the doers; the impractical the onlookers. The practical accomplish things. The impractical only want to see what is worth accomplishing. Practical people care most for a certain class, sect, party, organization, or corporation. Impractical people speak for all humanity. What an unfit place this world would be to live in if we were all practical, or if we were all impractical.

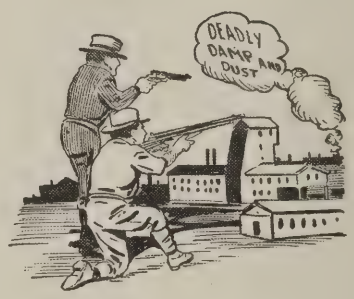
* * *

The most misleading and certainly the scariest things in the world today are statistics. The modern scientist can juggle his figures so as to prove beyond doubt that in 1990 A. D. there will be no wood for lumber, coal for fuel or meat for food. Each family will live on a farm 20 ft. x 20 ft., and everyone will have a pair of mechanical wings, necessary because there won't be room to walk on the earth. There will be no churches—religion will have died out—and as to finance three men will own all the money in the world. The thing we seem to forget is that *growth is limited*. When anything gets too big, it becomes top-heavy and falls. It is so with trusts, labor organizations, etc.—they are all "self-busting." Caesar and Napoleon found this idea true. Militarism in Europe is trembling from its very top-heaviness. Its fall may cost the lives of a million men; rivers may run red with human blood, but in the end all nations will be glad to disarm and live in peace.

* *

A man may have accumulated lots of money and attained industrial success, and still have only a minimum of brains. We are strengthened in this conclusion by the stupid attitude of so-called big business in leaving publicity to its enemies. We may not agree with Haywood, Moyer, Sinclair, Mother Jones, et al., but we admire their ability in the matter of obtaining publicity for their cause, no matter how unrighteous it may be. It is not the event, but the printed facts that live in history.

Successful men are usually specialists; they may know manufacturing, mining or finance, but have no understanding of psychology. Few men deny that today we are sitting on the edge of a volcano. It is no time to cultivate dignity or encourage class distinction. Silence is golden"—for the other fellow. If big business is honest and a desirable thing, if the men in charge are just and humane, now is the hour to say so, and say so, and then again say so.



Our patriotic congressmen, who get their salary regularly whether business is good or bad, send thousands of copies of their rampant speeches to the people at large—all mailed at public expense—which charges are largely paid as taxes by big business itself. As long as employees are trained to believe that the boss is their enemy, just that long will there be industrial war. Either big business deserves what it is getting, or the men at the helm today are something less than captains of industry.

The Goal

By Berton Braley

Written expressly for Coal Age

We're working slowly towards it
—The thing we hope to do,
We've planned and schemed and figured
To make it all come true,
And if the fiscal powers
Will give us half a chance,
We "engineering dreamers"
Will win to our romance.

We learn to put in timbers
That men may safely trust,
We'll conquer ventilation
And deadly damp and dust,
From tipple and from breaker
To where the pumps are placed,
You'll find us grimly fighting
Extravagance and waste.

We pore and fret and study
With purpose straight and stern,
And steadily and surely
We do our work and learn—
Learn we must win our battle
Again and yet again
And fight with Fate and Nature
The Elements and Men!

But 'mid our costly blunders
Our wastes and losses dire,
We still toil on and labor
To reach our heart's desire,
For sure as seas that thunder
And sure as suns that shine,
Some day we'll gain our vision
And make the Perfect Mine!

Commendation and Censure

It is a universally conceded fact that the highest efficiency of any machine organization is obtained when there is the least friction between the working parts.

Mr. Superintendent, you are he head of the organizations of the various plants under your charge. Are these organizations working up to their highest efficiency? Have you reduced the friction in the working parts to a minimum?

You may possess all the prerequisites that experience has established as characteristic of a competent man, but there is a large sized u (you) in luck, which changes the orthography of that word to success or failure.

Your organization is 99 per cent. the reflection and representation of your own individuality.

Is that individuality the narrow, selfish egotism of the "Boss," or is it the universal egotism of the Man?

Gen. Lew Wallace defined a captain as being "A fighting man armed with an army." The metaphor loses nothing in its application to all men in positions of authority.

Do you go among your men in the various departments with a chronic grouch? Do you don your nitroglycerin humor with your working garments? Do you have your blue glasses on from Monday morning until Saturday night? Do you congratulate yourself upon the fact that after a supervision of one of your departments, you have succeeded in making each individual sit up and take notice by impressing him with the fear of your authority?

If censure, alone, be the prominent feature of your relations, you will have an organization that will be merely mechanically operative and precariously adhesive through fear, and it is not fear of your individuality—your displeasure, but a sullen fear of your power, companioned by retaliation when opportunity offers.

Criticism and censure are necessary in any successful organization, but when used in conjunction, they should be preceded and accompanied by sound judgment and common sense.

Commendation is more effective in securing the ultimate perfection of an organization than censure. Have you ever tried it out and marked its effects? When you have found work performed in such a manner that it meets your approbation and proves the proficiency of the workman, have you taken the trouble (?) to give that man the meed of praise which his work merits, or have you simply regarded it as being what it is his duty to produce for the compensation he receives?

It would be well to remember that every man, no matter how humble his station in life may be, possesses an ideal of what he would like to become. The attempt to realize this ideal constitutes ambition. Does it not seem reasonable that a man will become more efficient as a factor if opportunities be afforded for the realization of his ambition? Nothing is so destructive to ambition as continual censure. Nothing is so contributive to it as sincere commendation.

You are not asked to be diplomatic—to indulge in fulsome flattery—but to be just. Express your approbation when your judgment deems it merited.

This will cost you nothing and will return you 100 per cent. in effective results.

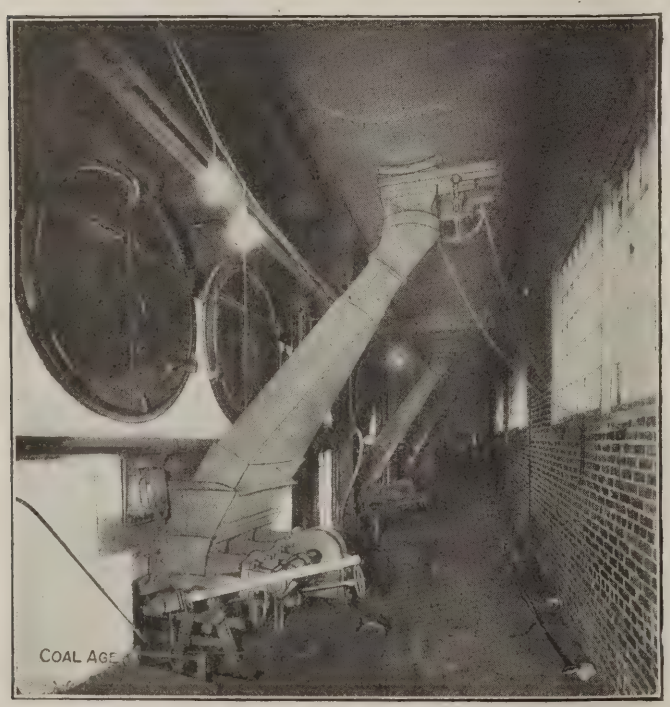
Try it. Lubricate the frictional parts with sincere commendation, and let your censure be alloyed with kindness and suggestion. Every man who is worthy of the name, in your organization, will come to regard himself as an essential part of the working whole upon which success or failure depends. Every faculty and power he possesses, both mental and physical will be brought into active operation to produce efficiency. He will be actuated by a righteous fear of losing your appreciation and good opinion because he has learned to appreciate and respect your worth and dignity as a man.

Plant of the Bessemer Coal & Coke Co.

By J. G. Bart*

SYNOPSIS—The improvements made in the firing apparatus made possible the burning of bone instead of coal as well as a material reduction in the amount of labor required for operation.

The power plant of the Bessemer Coal & Coke Co. at Russelton, Penn., is a good illustration of the tendency toward conservation in coal mine operation and the utilization of facilities at hand. The mines of this company are located about 18 miles north of Pittsburgh in Allegheny County, on the Bessemer & Lake Erie R.R., and in what are known as the Twin Freeport seams of coal.



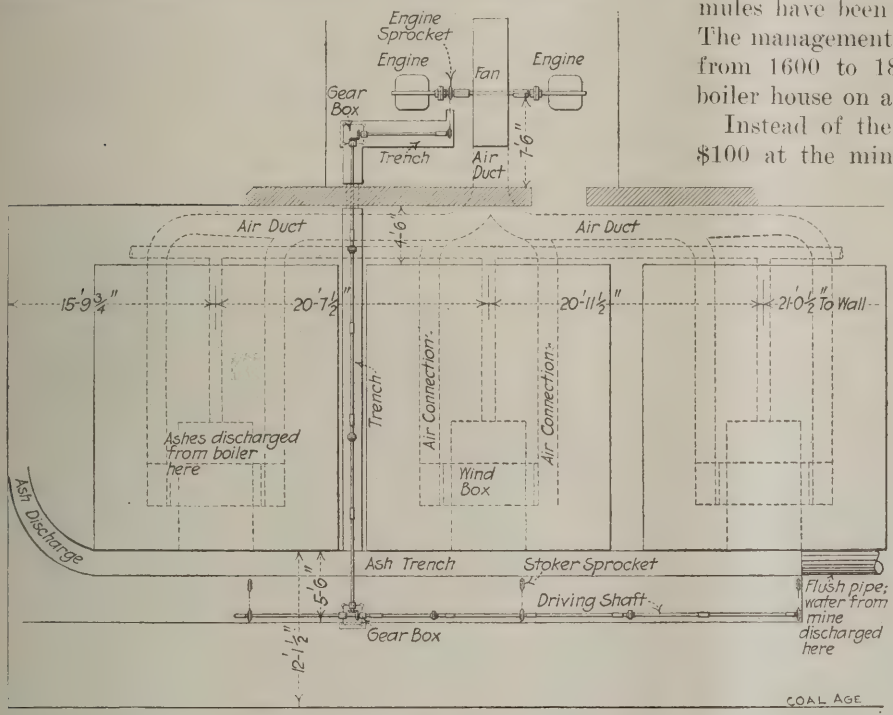
The two seams are about 3½ ft. thick and have between them a binder commonly called bone. This consists of layers of slate and thin strata of coal. In the process of mining, this bone is laid aside by the miners in headings that are to be used for air courses and haulage roads. Formerly this material was loaded on cars, sent to the surface and then hauled away by the railroad for filling. About 60 carloads were produced monthly and the cost of haulage was from $5 to $7 per car. This bone contains about 36 to 40 per cent. ash and averages 8000-9000 B.t.u. per lb. as fired.

General View of Engine and Boiler House

The boiler plant equipment formerly consisted of 8 horizontal return tubular boilers 72 in. in diameter and 18 ft. long, rated at 150 hp. each. Six of these were hand fired, located in one house and equipped with steam jets. The remaining two were in an adjacent house and equipped with a distributing type of coal feeder and

*General superintendent, Bessemer Coal & Coke Co., Russelton, Penn.

The Firing Alley in Front of Boilers



Inside of Furnace, Showing Tuyere Blocks

steam jets which had been installed to burn the bone coal.

This had not proven a practical operating proposition due to the large amount of ash in the fuel and all boilers were burning the best slack and ¾-in. nut coal valued at $1 per ton at the mine.

About two years ago the management decided to install stokers in order to burn the bone and also increase the capacity of the plant and reduce the labor charges. To eliminate all labor possible in handling the large amount of ash produced, a self-cleaning type of firing apparatus was essential and it was finally decided to install Taylor stokers under the 6 boilers in one house.

In order to reduce the initial cost of installation it was decided to hang two boilers over one 3-retort stoker. To

General Arrangement of Boilers, Fan Stokers and Ash-Disposal Trench

do this straps were riveted on the sides of the shells in place of the supporting lugs and the drums were hung from "I"-beams, which in turn were supported by columns at the side of the boilers. The two shells were brought to within 6 in. of each other and the space between filled with plastic cement. The distance from bottom of boiler shell to top of tuyeres is 3 ft. 6 in. The distance from top of bridge wall to bottom of drums is 4 ft. This gives a combustion chamber back of the bridge-wall 11 ft. 9 in. wide by approximately 8 ft. long and 5 ft. 6 in. high.

The two boilers over each stoker were equipped with a feed-water regulator and operated as a single unit, for which a separate stack was installed. Automatic regulation of coal feed and air in accordance with the demands for steam by the standard Taylor system was provided.

The Ashes Are Flushed from the Pits

A 10-in. stream of drainage water pumped from the mine was available for flushing, so the ash-pits were arranged to slope to a trench running on a line parallel with the front of the boilers. As the plant is located on the top of a considerable elevation, it was only necessary to run the trench to the edge of the hill, where sufficient ground was available to take care of the ashes for an indefinite period.

A crushing and conveying system was installed by which the bone is reduced to 1½ in. and carried from the top of the shaft to the bin over the stokers.

Formerly 8 boilers were required to carry the load and approximately 100 tons of coal per 24-hour run were burned. Ten men were required in the boiler room each 24 hours and owing to the hard firing conditions it was even then difficult to keep firemen.

With the new equipment the six stoker-fired boilers are carrying a materially heavier load than formerly, as the output of the mine has increased 75 per cent. and many mules have been replaced by an electric haulage system. The management states that the boilers frequently deliver from 1600 to 1800 hp. Six men are required in the boiler house on a 24-hour run.

Instead of the 100 tons of marketable coal valued at $100 at the mine, there are now burned approximately 125 tons of bone coal "straight" per day of 24 hours. The cost of disposing of the bone by railroad which formerly ran from $300 to $400 per month is also being saved.

The operation is practically smokeless excepting on extreme loads with an exceptionally poor quality of bone. For a short time while the remainder of the plant was being installed, two units were run on slack coal, when the operation was entirely smokeless.

The maintenance of the steam pressure automatically within 5 lb. of the operating figure has been an important item. The management states that furnace and stoker repairs for over a year during which time the equipment has been in service have been practically nothing. This power plant is now considered one of the most modern in the Pittsburgh district.

Lignite in Montana

As the northeastern portion of Montana is barren of timber except along some of the larger streams, a supply of fuel other than wood is all-important. According to a recent report by the U. S. Geological Survey, thin beds of lignite are exposed along the valley of Poplar River, near Scobey, from which enough fuel may be obtained for local use.

In the vicinity of Plentywood, in the valley of Big Muddy Creek, the beds of lignite are much thicker and contain an amount sufficient not only for the needs of the ranches in that vicinity, but also for shipment to other places as the population increases.

In the region between Scobey and Plentywood, little information regarding lignite was obtainable, as the region is so deeply covered with glacial drift that exposures of the hard rocks can seldom be found. It is probable, however, that even here lignite may be found by shafting.

A general description of the field is contained in Bulletin 541-H, of the U. S. Geological Survey, Washington, D. C.

Leaks in the Preparation of Anthracite Coal

By D. M. Hopkins*

SYNOPSIS—Some comments on modern breaker practice from the viewpoint of the practical man.

There are probably few people who appreciate the great importance of this subject. After an experience in breakers dating back to 1889, I feel that I have an intimate knowledge of the subject, and it is my intention to deal with it in a purely practical manner. As a preface to the article, I wish to remind the reader of the great importance of maintaining as large a proportion of the domestic grades as possible, since it is upon these that, essentially, the whole profit of the anthracite operator hinges. As is well known there is little or no profit in the steam sizes.

Bliss Colliery of D. L. & W. R.R. Co., Nanticoke, Penn.

This colliery employs 1100 men, and prepares more than 600,000 tons of coal annually. There was not a single fatal accident at this plant in 1913, which record was undoubtedly due largely to the fact that 66% of the men are students of the Nanticoke Mining School.

Let us first consider certain state laws regulating the manner in which coal shall be handled from the mine to the breaker, about which there is considerable difference of opinion. To reduce the breakage to a minimum, there is no doubt but that the coal should be conveyed in the mine cars directly to the point where it is to be first treated in the breaker without any intermediate dumping.

Treatment in the Breaker

The first operation in the breaker proper consists in screening over either stationary or shaking screens. The shaking screen, as a rule, is the most desirable, since the sizing is more thorough and there is not the violent speed and consequent breakage characteristic of the gravity bar screens. Poor screening is also a result of the latter method, a certain percentage of the domestic grades being carried through with a consequent loss in profits.

The prepared sizes from the screen are passed on to a moving table for preliminary cleaning. It is highly important that adequate facilities be provided to permit of a thorough cleaning at this point, since one piece of impurity may be removed here which, if passed through the roll, may become 40 or 50 distinct pieces, and hence require this much additional treatment. Indeed, it has frequently been an open question in my mind as to whether this phase of the breaker receives the attention it justifies.

From the table the coal is passed on into the roll, which, owing to the exceedingly large sizes which occasionally must be crushed, usually consists of two pairs. To avoid unnecessary crushing, it is customary to screen out the domestic sizes and smaller between the first and second rolls. These latter are usually perforated plate or stationary bars, but I am of the opinion that they should be shaking screens. The rolls are generally of the high-speed toothed variety, ranging in speed from 250 ft. per min. to 1500 ft. per min. It is my opinion that 750 ft. per min. is the speed about best suited for our coal.

It has occurred to me a number of times that we are perhaps devoting too much attention to the speed of the roll and too little to the proper design. Let us take, for example, two types of rolls: The first, 27 in. in diameter by 36 in. long, with teeth located at 2½-in. centers. This class of roll will ordinarly produce 53 per cent. prepared sizes, and under the most favorable conditions 60 per cent. The second type is of the same diameter and length, but the teeth are centered at 3½

*Assistant foreman Bliss mine, D., L. & W. Co., Nanticoke, Penn.

in. and the yield of prepared sizes would be about 81 per cent. Assuming now a colliery having a capacity of 2000 tons per day, the difference in the prepared sizes produced by these two different types of rolls would amount to 252 tons, which, in turn, means a saving of about $156 per day. It is thus obvious that the question of rolls is a most important one.

Notes on Operation of Rolls

Another important consideration in connection with rolls is the period they should be operated, it being the custom here, as is frequently the case around mining operations, to continue working the machine as long as it will hold together. Dull teeth pulverize the coal badly, and it is generally agreed that at the end of a year's service the crusher is producing 5 per cent. less of the prepared grades than was originally the case.

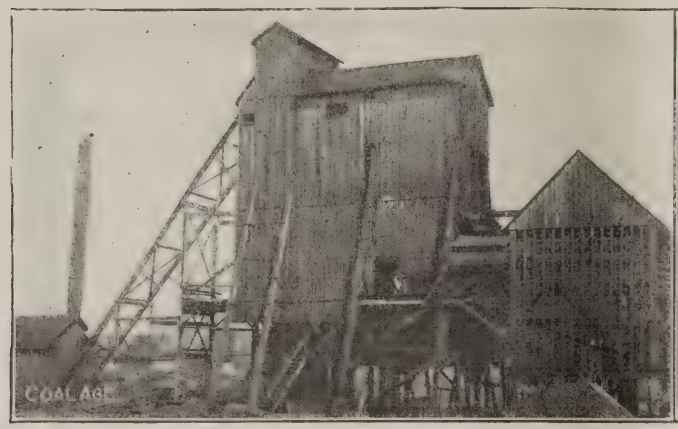
In another instance we installed a rather unusual device to prevent coal from pounding against sheet iron, consisting of old rubber belting bolted to it. In another case, it was found that an important saving was effected by changing certain chutes from a 5- or 6-in. pitch to a 2 or 3 in., and conveying the coal through the increased elevation by means of a spiral. Again, a large saving can be effected by eliminating all right-angle turns in chutes.

While many of these modern improvements are very desirable from a humane standpoint, this unlimited introduction of machinery and the mechanical handling of the coal has had a decided tendency toward deterioration in the process. For instance, let us consider the treatment of egg and stove coal, which is now considered of too inferior a quality to pass inspection. Some of our predecessors evolved the idea of putting these grades back through what was termed the boney roll, where they were reduced to pea, buckwheat, rice and barley that could be passed. The great evil in this practice is that enormous tonnages of what is really good coal is now thrown out in this way by careless slate pickers.

Another condition replete with many undesirable possibilities is the competition between breaker foremen. Let us assume a hypothetical condition of two breakers each producing 50,000 tons per day from the same coal. In one, 50 per cent. of the coal is prepared grades and the cost of preparation is 10c. per ton, making the gross breaker operating charge $5000. The other breaker produces 65 per cent. prepared sizes at a cost of 15c. per ton, making a gross of $7500. Even though the cost of operation at the second breaker is 50 per cent. greater it will be found that, at a selling price of $3.50 per ton, the earnings of the second colliery exceed those of the first by $32,500. It is a case of not the cost per ton as the kind of a ton you produce.

Lake Trade Lifeless

Another month has gone by and, if anything, lake trade is in a worse condition than it was a month ago. There was some hope of an improvement about July 1, but it did not materialize, and, if anything, the trade is more listless than ever. Sales of ore have been extremely light and vessel after vessel has gone into ordinary. Now that the first rush of grain is over, it is clear that there have been too many ships in commission all along for the business offering. No material change is now expected until the fall months. Grain has been carried at figures that leave no profit to the ship and the rates for future chartering are very low. Were it not for the fact that crops are very heavy, there would not be a single ray of sunlight in the whole situation. Scores of mines have shut down, some because they cannot sell the ore and others because they cannot be profitably operated at present prices. All along the line the whole business is being conducted at a loss and there has never been a time when things have been as dull on the lakes as they are now.



Sorry sights are to be seen at all Lake Erie ports. Dozens of ships are moored broadside to broadside behind the breakwaters. Some have been there since the season opened, some have made a trip or two, and some more that are now making trips will be added to the idle fleet as soon as they discharge present cargoes. And some people say that the depression is only sentimental. We wonder what they consider a real depression to be? The depression of 1893 was certainly not as complete as the present one.—*The Marine Review.*

Another View of the D. L. & W. R.R. Co.'s Bliss Colliery, at Nanticoke

Firetrap Headframes in Arkansas

The five firetrap headframes shown in the accompanying illustrations are all in Johnson County, Arkansas, not far from Spadra and Montana near the Arkansas River. It is unfortunate that any such menaces to the lives of the miners have been permitted to be constructed in that state or in any other. Surely the vested rights of the coal companies are in no case so sacred that corporations should be allowed to operate their mines under such hazards.

Sunshine Mine of Spadra Coal Co.

Superior Anthracite Coal Co.'s Mine

Consolidated Coal Co.'s Mine

Clark-McWilliams Coal Co.'s Mine

The coal mined is a semi-anthracite and that fact calls to memory the terrible mine fire at Avondale mine, Plymouth, Penn., Sept. 6, 1869, when 179 men were killed as a result of a breaker fire. Consequent on the conflagration, regulations needed, and none too stringent, were passed in Pennsylvania. On May 21, 1871, smoke from a burning breaker destroyed 20 persons in the West Pittston mine, West Pittston, Penn.

These proofs of the danger of rattletrap headframes with extensive headworks should be enough to give operators warning of their danger. The recent fire at the fan house of the Sycamore Coal Co., at Cinderella, near Williamson, W. Va., in which five men were suffocated, only adds to the evidence already overpowering that buildings over mine openings should be fireproof. We are to be congratulated that having so many combustible topworks, the accidents have been so few and so rarely the cause of a large number of deaths, but this immunity may not always be granted us and at any time we may hear of accidents in which many hundreds may be involved. The bare timber headframe is not so much to be reprobated, but when the shaft is surrounded by a group of buildings all highly inflammable and all filled with workingmen who may set fire to the flimsy structures, the danger is extreme especially if the escape shaft is near-by or the shaft thus incumbered is a downcast.

Scranton Anthracite Coal Co.'s Mine

Costs and Various Applications of Piping at Coal Mines

W. B. Richards*

SYNOPSIS—A detailed analysis of the cost of piping, worked out on practical rather than theoretical lines, and supplemented by some valuable and original tables. Also notes on the different types of pipe, including spiral riveter, wood, cast iron, etc., with comments on their various usages in and about colliery operations.

The accompanying tables show the complete cost of laying pipe of various types and sizes, being an average of actual cost of such laying under conditions encountered in the Panther Creek valley.

These tables are used as a basis in compiling estimates where excavation is through medium hard clay or soil, with some loose rock and laid under summer conditions. Cost of excavation and back fill for pipe laid in winter weather will run higher than in summer, depending on the depth of the frost in the ground. Length of haul, and conditions of road must be considered, as the cost of carting and distributing largely affects the cost per lineal foot of laying pipe. The average haul in the lines covered by the tables was about three-fourths of a mile. The figures are, of course, approximate, but with careful consideration of conditions under which pipe will be laid, they form a reliable basis for estimating.

TABLE SHOWING COST OF BLACK AND GALVANIZED PIPE LAID IN PLACE AND COSTS OF OTHER VARIETY OF PIPES—1913

	Cost per Foot of Pipe Laid in Place				Cost of Pipe per Foot

Note—In winter excavation and back fill will cost twice as much.
[1]Includes handling, excavating. [2]Equals the total cost per foot of galvanized pipe laid 5 ft. in the ground.

Purpose and Conditions for Which Types of Pipes are Best Adapted

Cast-iron pipe, with ball and spigot joint, is the most widely used type for water pipes. By reason of its moderate cost, and durability, it is almost universally employed in water-distributing systems and various other special forms of distribution. The sizes commonly used run from 4 to 24 in. in diameter. The different grades are designated according to class as follows:

	Designed For			Designed For	
Class	Ft. Head	Lb. per Sq.In.	Class	Ft. Head	Lb. per Sq.In.
A	100	43	C	300	130
B	200	86	D	400	173

Cast-iron pipe, bell and spigot joint, is used in conducting water from reservoirs in Nesquehoning valley to Lansford and Coal Dale boroughs, the sizes varying from 4 to 12 in. in diameter.

Spiral riveted galvanized pipe, 18 in. in diameter, is used in conducting water from Hauto reservoir to Hauto pumping plant, under a head of 40 ft. This pipe is an emergency line laid on the surface; the pumping plant receives water regularly from a channel below the overflow of Hauto reservoir, but in times of drought it is necessary to draw from the dam, through this spiral riveted pipe. Second-hand spiral pipe is frequently used for culverts under public roads.

Spiral riveted galvanized pipe is used extensively in ventilating tunnels and gangways in which there are no return airways. A system in general use is to place an electric booster fan to drive air through an 18-in. pipe to the face of the tunnel or gangway, and allow the air to return out the tunnel or gangway, until a hole is driven to the surface or the upper level, when the fan is moved nearer the face and pipe used again to advance the tunnel or gangway. Gangways and tunnels four miles long have been driven by this method; they are usually ventilated a distance of 2000 ft., when fan must be advanced.

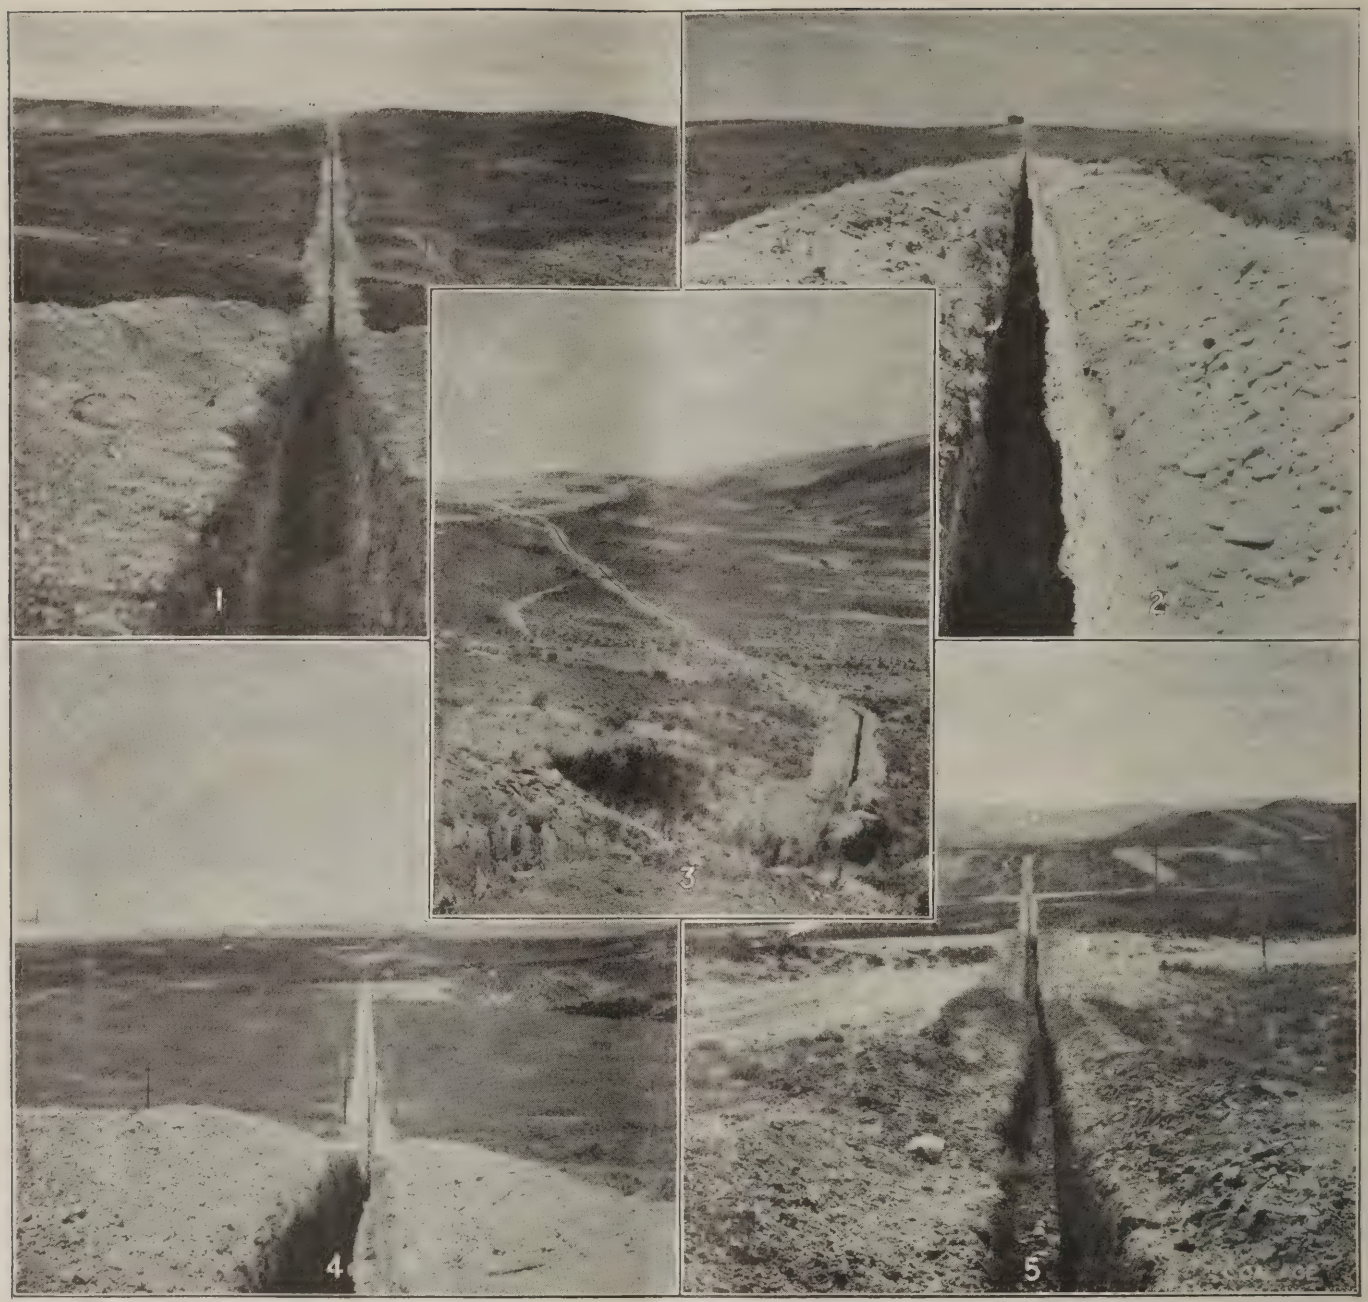

TABLE SHOWING COST OF LAYING VITRIFIED SALT GLAZED SEWER PIPE, 1913

	Per Lineal Foot					Cartage, Distribution and Shipping Loss	Superintendence, Engineers, Etc.	
Diam. (In.)	Weight (Lb.)	Cost	Cost of Cement	Excavation and Filling[1]	Laying			Total
4	9	$0.06	$0.005	$0.35	$0.01	$0.01	$0.04	$0.48
6	15	0.09	0.0075	0.35	0.02	0.01	0.04	0.52

Fig. 3 was taken on the saddle to the left of the intermediate tank, just perceptible against the sky line in the extreme right background of Fig. 5. Figs. 4 and 5 are views taken in opposite directions from the top of the divide, shown against the sky line in Fig. 1. This divide and the saddle from which Fig. 3 was taken were the two high points on the line, which was a gravity system throughout.

coal breakers; also for small water pipe lines where water is not intended for potable use. Steel pipe, galvanized, laid underground, is used to carry potable water for domestic purposes.

Extra-heavy cast-iron pipe is used for column lines through mine shafts and slopes in unwatering the workings. It is also used in breaker practice to conduct wash water to the shaker screens, jigs and lip screens, used in the preparation of the coal. They are made extra heavy, the better to resist the action of the sulphuric acid in the mine water, the added life of an extra-heavy pipe being about twice that of standard weight pipe. This same result is obtained, although at somewhat higher cost, by installing wood-lined, cast-iron pipe for conducting acid water and slush.

Vitrified salt-glazed sewer pipe is commonly used for conducting sewage; its chief use in the anthracite-coal industry is to convey wash water or drainage (particularly acidiuous mine water) under team roads and railroads, water from storage dams, into which mine water is delivered, to breaker.

Wood-stave pipe, machine made, from 4 to 14 in. in diameter is used extensively in and around the anthracite mines. A 7000-ft. line of 14-in. wood pipe is now being laid from a slush pump at one of the breakers of the Lehigh Coal & Navigation Co., to a point over a mine fire. Three 8-in. holes, 700 ft. deep, are being drilled from the surface to the area affected by the fire, and the waste water from the breaker, which contains a small per cent. of culm, is to be pumped through this 14-in. wood pipe

line to slush the fire area. Slush or coal dirt will be conveyed by rail to a point about 50 ft. from the drill holes, where it will be dropped into two wooden flumes laid beneath the railroad; the water delivered by the 14-in. wood pipe line will then be turned through a 2½-in. hose on the slush to wash it through the wooden troughs to the drill holes and down into the mine-fire area. By this method it is expected that the fire will in a very short time be extinguished.

pipe depends upon the water conducted, clear spring water, turbid river waters, or waters carrying organic matter. Growth on the interior of the pipe can be removed by sending an instrument generally known as a "Go Devil" through the pipe, cutting away the tubercles.

The carrying capacity of spiral riveted pipe is from 10 to 15 per cent. less than cast-iron pipe, owing to the increased friction caused by the laps and projecting rivets. When used for a number of years the inside of wood-

TABLE SHOWING DISTRIBUTION OF COSTS IN LAYING WATER PIPE—1913

[1] Based on the ruling price in 1913 of $24 per ton. [2] Computed on a basis of 6c. per pound. [3] Computed on a basis of 7c. per pound. [4] Includes B. & S. to lay 12 ft.

Note—In winter the cost per lineal foot of laying pipe will be doubled for excavation and back fill.

Excavation and Back Filling—A trench 5 ft. by 2 ft. contains 0.37 cu.yd. per lin.ft. Where excavating costs 4.5c. per cu.yd. the cost per lin.ft. is 17c. Back filling @ 20c. per cu.yd. amounts to 7½c per lin.ft.

Wood pipe is also extensively used in breakers for conveying wash water from the reservoirs to screens and jigs, and in water-works practice to conduct water to the pumping plants. A 23,000-ft. line of 6-in. wood pipe is now being laid over the ground by the Panther Valley Water Co. from a creek in Nesquehoning Valley to the Hauto pumping plant; this is a reserve supply to be used as an aid to the Bear Creek reservoir supply in times of drought. From this is furnished the domestic water supply of Lansford and Coal Dale Boroughs.

TABLE SHOWING COST PER FOOT OF LAYING WOOD PIPE ON SURFACE

	200 Ft. Head, 86 Lb. Pressure					
Diam., In.	Weight per Ft., Lb.	Cartage and Distribution	Laying	Superintendence	Cost of Pipe	Total
2	5	$0.065	$0.01	$0.03	$0.16	$0.21
4	10	0.005	0.01	0.03	0.28	0.33
6	11	0.005	0.015	0.03	0.41	0.46
8	14	0.007	0.02	0.03	0.53	0.60
10	18	0.01	0.03	0.03	0.64	0.70
12	20	0.01	0.03	0.03	0.75	0.82
14	25	0.01	0.03	0.03	0.87	0.95
16	28	0.01	0.03	0.03	0.97	1.05

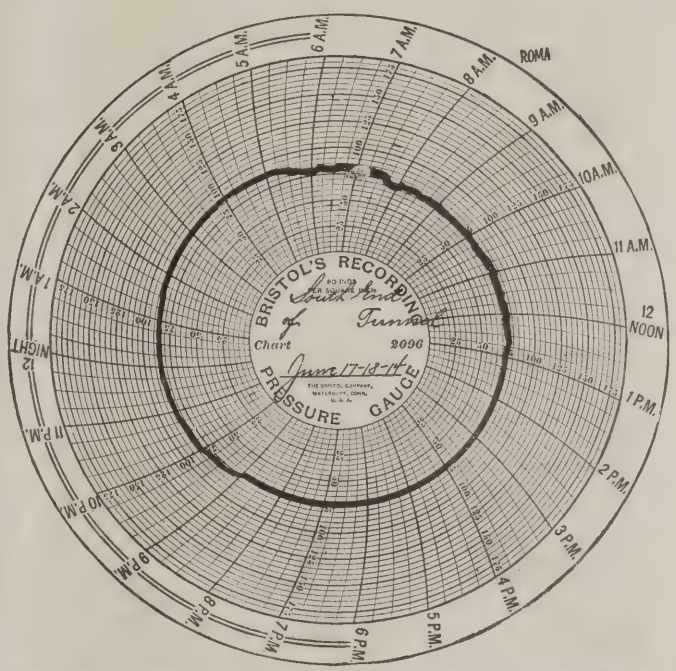
20	36	0.015	0.04	0.03	1.35	1.45
24	45	0.02	0.045	0.03	1.77	1.90

Wrought-iron pipe will stand the following pressures per square inch:

Dia. In.	Lb.	Dia. In.	Lb.
1	1500	6	600
2	1000	8	500
3	900	10	500
4	800	12	500



Safe pressures for cast-iron pipe depend on the thickness of the metal, and runs as follows, where the metal is ½ in. thick:

Dia., In.	Lb. per Sq.In.	Dia., In.	Lb. per Sq.In.
4	224	10	44
6	124	12	24
8	74		

Wood-stave pipe is made to stand a pressure up to 300 lb. per sq. in.

Flow of Water in Pipes

In estimating size of pipe required, it must be remembered that friction of liquids in pipes increases as the square of the velocity, and doubling the diameter of a pipe will increase its capacity four times. Frequently, in the case of cast-iron and wrought-iron pipe, the carrying capacity is reduced by the growth of tubercules on the interior about 1 per cent. per annum. In small pipes the deterioration is more rapid. Deterioration of the

Typical Pressure Gage of Panther Valley Water Co., Showing Fluctuations over a 24-Hr. Period

stave pipe wears smooth and the friction is decreased. The quantity of water discharged through a pipe depends on the head, i.e., the vertical distance between the level surface of still water in the chamber at the entrance of the pipe, and the level of the center of the discharge end; also upon the length of pipe, the character of its interior surface, as to its smoothness, and upon the number and

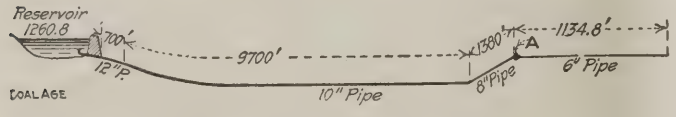
sharpness of the bends, but it is independent of the position of the pipe, horizontal, inclined upward or downward.



The head, instead of being an actual distance between levels, may be caused by pressure, as by a pump, in which case the head is calculated as a vertical distance, corresponding to the pressure one pound per square inch, equal to 2.309-ft. head, or 1-ft. head equals 0.433 lb. per sq.in. Small pipes with a high rate of flow when using a pump, cause a great loss of power. The head or pressure is what would be indicated by a pressure gage attached to the pipe near the point of delivery. Readings of the gage should be taken while the water is flowing from the pipe.

Friction Loss in Pipes

The following table shows discharge, friction head and velocity of flow through smooth cast-iron pipes, 8, 10 and 12 in. in diameter:

Discharge Gal. per Min.	8-In. Pipe Loss of Head per 1000 Ft.	8-In. Pipe Velocity Ft. per Sec.	10-In. Pipe Loss of Head per 1000 Ft.	10-In. Pipe Velocity Ft. per Sec.	12-In. Pipe Loss of Head per 1000 Ft.	12-In. Pipe Velocity Ft. per Sec.
200	1.1	1.3	0.35	0.82	0.14	0.57
500	5.6	3.2	1.87	2.0	0.78	0.14
1000	20	6.4	7.7	4.1	2.8	2.8

On a test made on a cast-iron, bell and spigot joint, pipe line 11,790 ft. long, as shown on the accompanying

Profile of Line Tested

sketch, with water flowing through main and service pipes, the following observations were made by means of a pressure gage:

At point marked *A* the gage registered from 14 to 40 lb. pressure per sq.in., the water in the pipe being in motion when the gage was read:

Elevation of reservoir was..	1260.8
Elevation at gage was.....	1134.8
Calculated	126.0 = head × 0.434 = 54.68 lb.

It was calculated that when the pipe was passing 950 gal. per min. at the gage, that it should register 16.77 lb. pressure per sq.in. The loss of head in feet (due to friction in pipe) per 1000 ft. when delivering 950 gal. per min. was computed as follows: 12-in. pipe, 2.55 ft.; 10-in. pipe, 6.1 ft.; 8-in. pipe, 18.4 ft.; 6-in. pipe, 72.0 ft. On this basis the respective losses (see sketch) were: 700 ft. of 12-in. pipe = 1.78 ft.; 9700 ft. of 10-in. pipe = 60.17 ft., and 1380 ft. of 8-in. pipe = 25.39 ft., making a total of 87.34 ft. With a total head of 126 ft. and a friction loss of 87.34 ft., the effective head works out 16.77 lb. when the pipe was delivering 950 gal. per min.

TABLE SHOWING COST OF LAYING SPIRAL RIVETTED GALVANIZED PIPE, WITH BOLTED JOINTS, COMPLETE, 1913

Diam. of Pipe (In.)	Wire Gauge	Cost per Lin.Ft. Small Orders[1]	Large Orders[2]	Laid on Surface
4	18	$0.30	$0.26	$0.30
6	16	0.49	0.43	0.49
8	16	0.65	0.57	0.63
10	14	0.96	0.84	0.91
14	14	1.38	1.21	1.28
18	12	2.26	2.00	2.08
20	12	2.48	2.18	2.27
24	12	2.93	2.58	2.68

[1]Involving less than $250. [2] In large quantities at which discounts of 12% are obtainable.

As the quantity of water delivered in the pipe was checked by less water being consumed, the pressure increased, as registered on the pressure gage, and when consumption was lowest, gage registered 40 lb. pressure per sq.in. By making this a 12-in. line, the entire length, the loss of head due to friction would have been 30 ft., and the pressure at the gage would have registered 41 lb. per sq.in. when delivering 950 gal. per min.

The accompanying record on a recording gage, as used by the Panther Valley Water Co., shows the pressure per square inch for every minute of the day. It will be noted that at 5 a.m., with practically no water being used, gage registered 90 lb. pressure; at about 5:15 a.m., when the early morning domestic consumption began, the pressure dropped to about 80 lb. Between 7 and 7:45 a.m., with full consumption of water being drawn in practically every dwelling, the gage dropped to about 75 lb. and held at that until about 9 a.m., when the demand commenced to decrease, and from then on the gage shows the pressure to have increased rapidly to 90 lb. and remained there until 5:15 a.m., proving that the greater the consumption the lower the pressure.

The elevation of the reservoir is 1260.8 and the elevation at the gage is 1015.0, a difference of 245.8 ft., equal to a pressure of 106.67 lb. per sq.in. From the above it can be determined, if the information is carefully considered, what size and type of pipe should be used to best advantage for different pump or gravity conditions, and the tables showing cost of pipe per foot will be of value.

Montana Breaks Coal Record

The production of coal in Montana in 1913, was, according to E. W. Parker, of the U. S. Geological Survey, 3,246,973 short tons, valued at $5,653,539, being the record figures for the industry in the state.

The influences which have affected the coal-mining industry in Montana during the past year were first an influx of settlers into the state which resulted in an increased demand for domestic coal, second, a decreased consumption by the railroads because of the increasing use of oil, and third, extensive hydro-electric development to supply light and power to many cities, also to mining plants and manufacturing establishments.

The second and third influences named have naturally resulted in a decreased demand for steam coal, but the larger demand for domestic fuel more than outweighed the two adverse influences combined, and the production of 1913 showed an increase over the preceding year of 192,478 short tons, or 6.3 per cent. in quantity, and of $95,344, or 1.7 per cent. in value. As in each of the four preceding years, the output for 1913 was the maximum yet attained.

There were no serious interruptions to mining operation in 1913 on account of labor trouble. The number of men employed in the coal mines of the state was 3640, working an average of 228 days, against 3440 men on an average of 220 days during the preceding year.

The mine workers of Montana have a good record for efficiency, and in 1912, the state showed the best average production per man per day among all of the coal-producing states. In 1913, the average production per man for the year exceeded that of 1912, 893 tons against 886 tons, but the average daily output by each employee decreased from 4.03 to 3.92 tons. The fatality record maintained by the Bureau of Mines shows an unfortunate increase from the low point of 7 in 1912 to 20 in 1913.

An Endless-Rope System for an Inclined Plane

By A. D. McFarlane*

SYNOPSIS—A long and steep plane is operated by an endless-rope system and carries a fair tonnage at an expense of a little over 3c. per ton, seven men being employed in its operation.

West Virginia produced 59,581,774 tons of 2240 lb. of coal in the year ending June 30, 1912; of this at least 27 per cent., or 16,335,247 tons, had to be lowered from the mine to the tipple by some system of haulage or conveyance. This was accomplished by various means which may be divided into two general classes. The first may be taken to include all systems in which mechanical power was required, the second those in which the force or power of gravity developed by the descending load was utilized to return the ascending load to the mine level. It is not the purpose of this paper to compare the merits and defects of the various systems, but to describe a system of the second class as used by the LaFollette Coal, Iron & Ry. Co., at their Gem mine, in Campbell County, Tennessee. The system used may be described as an endless-rope gravity plane because the loaded cars in descending pull the empty cars back by means of an endless rope.

View of Incline Loaded and Empty Trips

The Gem mine is situated on a branch of the Louisville & Nashville Ry. and is working the Jordan seam, with an average elevation of 1986 ft. above sea level. The railroad in the valley is 1340 ft. above tide level, so that all coal shipped has to be lowered a vertical distance of 613 ft. to the tipple floor. The horizontal distance between the knuckle and the tipple is 3640 ft., and the length of the plane is 3700 ft. and its average inclination is 16.8 per cent. The plane starts from the knuckle with a 19.8 per cent. grade; this runs for 750 ft. and then increases to 28.4 per cent. for 600 ft., after which it decreases to 18.8 per cent. for a distance of 300 ft.; from this point the grade gradually decreases until it ends at the tipple with a 3.3 per cent. grade.

The Plane

The plane is laid with 30-lb. rails, two tracks of 36-in. gage on 6-ft. centers. One track is used by the descending loads while the other is used by the ascending empties. Cast-iron rollers, 6 in. in diameter and 6 in. wide, with chilled surfaces, are placed in the center of each track on 50-ft. centers. A 10-in. board is spiked to the ties, which are placed on 20-in. centers. The board keeps the rope from dragging on the ground. Owing to the topography, it was deemed advisable to place two curves in the plane, one near the top which is on an inclination of 20 per cent., while the other near the bottom is on a 3 per cent. grade. On the curves the outer rail is elevated and sheaves are placed 20 ft. apart to deflect the rope.

Going around a Sharp Curve

The Rope

The rope in use is of plow steel, 1⅛ in. diameter and composed of 6 strands of 19 wires each wrapped around a hemp center. It has a rated breaking stress of 55 tons per sq.in. The rope runs down the center of one track, around a sheave wheel, placed on a tension carriage running underneath the tipple floor, then up the center of

* Chief engineer LaFollette Coal, Iron & Ry. Co., Box 334, LaFollette, Tenn.

Note—Article read before the West Virginia Coal Mining Institute at Cumberland, Md., June 3, 1914.

the second track to the drums, which are beneath the floor of the head house, then four times around the drums to the center of the first track.

The Tension Carriage

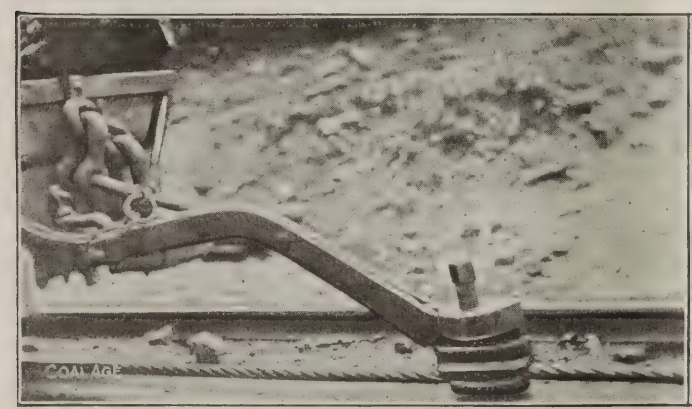
The tension carriage is made from a standard freight-car truck. Upon this truck is mounted an iron sheave wheel 6 ft. in diameter with a $4\frac{5}{16}$-in. shaft. This truck rolls on 30-lb. rails set on an angle of 35 deg. to the horizontal and is loaded with scrap until it weighs three tons. Its distance of travel scarcely exceeds 3 in. except in a wreck, then the travel is violent and long.

The Drums and Brake

At the head of the plane are two cast-iron drums, 6 ft. in diameter and 4 ft. high, set vertically on 10-ft. centers with their line of centers parallel to the plane and grooved to receive the rope. These drums are controlled by an ordinary friction-band brake, suitably counterweighted so that the brake is set, except when held released by the drumman. This brake is connected by a ½-in. chain to a handwheel, such as is used on freight cars. This wheel is set to one side so as to be out of the way of the cars, but sufficiently close enough that the drumman can see the headmen attach and detach the trips.

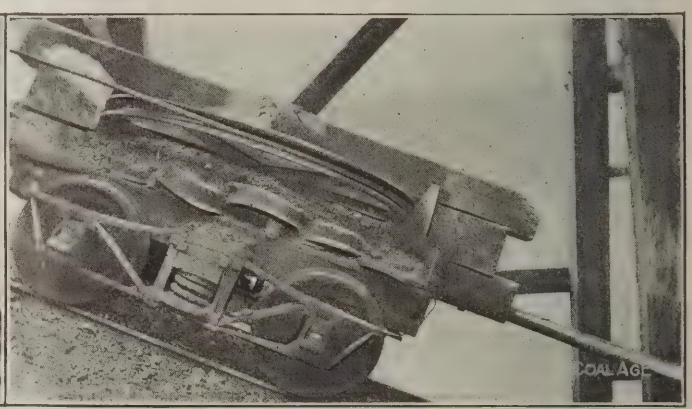
Method of Operation

The mine cars are pushed into the head house by the mine motor and made up into trips of 5 cars coupled together by the regular mine-car couplings; to the rear drawbar of the last car a special grip is attached, which is fastened to the rope by tightening a setscrew. While the loaded trip is being attached to the rope, an empty trip has been detached on the adjacent track; at the same time the couplers in the tipple have detached a loaded and attached an empty trip. When the couplers in the tipple have everything in readiness, they signal to the drumman, either by an electric bell or telephone; he then looks to the couplers on the head for the signal, and if they are ready, he tightens his wheel, thereby raising the counterweight, loosening the brake, which releases the drums and allows the loaded trip to descend and an empty trip to ascend to the proper point in the head house.



When this point is reached, the brake is tightened, the rope stopped and an empty and loaded trip detached and attached as before. In the meantime, the first trip has descended approximately 700 ft. This operation is repeated until 5 loaded trips are on the rope; as the sixth is being attached, the first is being detached on the tipple. The tipple is equipped with a Phillips cross-over dump, necessitating the empty track being some 4 ft. lower than the loaded at the point where the trips are attached and detached. With this difference in elevation and the grade of the tracks being opposite in direction, the important point in landing the trips is to stop the empty trip at the proper point in the head house. This being directly under the eye of the drumman, little trouble is experienced on this score.

There is surprisingly little difference in the spacing of the trips, and it is seldom they have to be respaced. There is no physical or mechanical difficulty in increasing the number of cars per trip or the number of trips suspended on the rope, but in designing such an installation, it must be borne in mind that the rope distance between the attaching and detaching points in the head house and tipple must be the same, and that this distance will govern the spacing of the trips. In this particular installation there are 6 trips of loads and 6 trips of empties on the plane at one time, counting the trips at the head and at the tipple; so that the distance between trip centers is equal to one-twelfth of the total rope length.



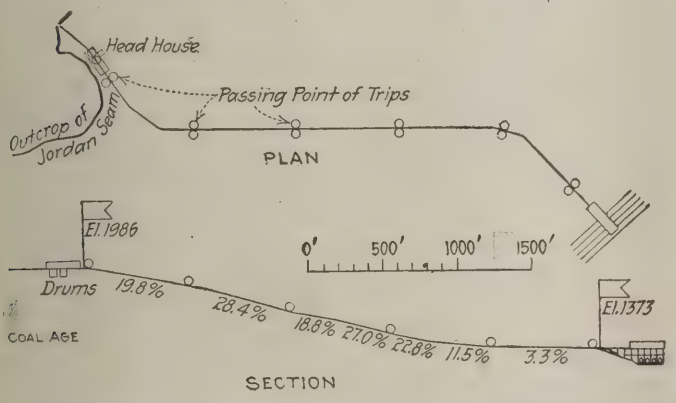
The Grip

By referring to the accompanying drawing, it will be seen that the grip is composed of two parts, the arm and head held together by a ⅞-in. rivet. The arm is made from machine steel 2½x⅝ in. thick, doubled back and riveted by ⅝-in. rivets, forming an arm 1¼x2½ in. The upper end of the arm is rounded out to receive the 1⅛-in. clevis pin of the car coupling; the lower end is flared out in the form of a yoke to receive the head. The arm is bent vertically to compensate for the difference in height of the drawbar and rope. The head is made of three parts, one of which is a standard setscrew, 1½x4½ in.

The grip block is made from a piece of steel 2x2¼x6 in., forged as shown and drilled to receive the point of the setscrew. The bottom and outside are grooved—the bottom to receive the rope and the side to clear the flange of the curve sheaves. The jaw is forged from a piece of steel 4x4¼x6 in., recessed as shown to receive the rope and drilled and threaded for the setscrew. Both the grip block and the jaw are turned in the form of an arc, so that when the setscrew is tightened the rope is crimped, thereby preventing any slippage. The crimping being only ⅛ in. does not injure the rope. The grips weigh about 50 lb. each and their maintenance is almost

Showing Type of Grip Used

View of Tension Carriage



negligible. To attach or detach one takes considerably less than a minute.

Labor Required

Seven men are required to operate the plane. The drumman operates the drum and has supervision over the head. Two couplers in the head house and two on the tipple attach and detach the trips. A man is stationed where the loaded trips first stop, and at this point there is a derailing switch which can be thrown in case of a wreck or runaway on the track above. The planeman is furnished with a wrench, and tests the grips and oils the outer wheels of the descending trips. At the first stop of the ascending trip another oiler is placed; he oils the outer wheels of the ascending trips. Both of these planemen are stationed so that they command a view of the upper and lower curves respectively, and at each station is placed a switch, which, when thrown, flashes an electric light in the head house. In case of a wreck or accident, the switch is thrown, warning the drumman, who immediately stops the rope.

Cost of Operation and Maintenance

Two years ago the present rope was installed and cost in place $2000. A new rope, recently ordered for installation during the summer, will cost much less. In 1913, 140,497 tons of coal were lowered down this plane in 268 days of 9 hours each, or an average of 524 tons per

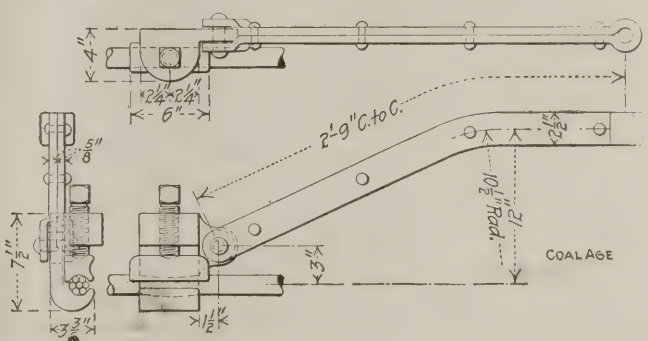
Plan and Elevation of Inclined Plane

day. The maximum tonnage handled in one day was 885 tons in 8½ hours, which is at the rate of 104 tons per hour.

Taking the life of the rope at two years, which has been proved by past experience to be the average, the depreciation of the rope amounts to $\frac{7}{10}$c. for each ton of coal handled. The wages of the 7 men employed aggregate $11.83 per day, or 2¼c. per ton; this also includes the labor of oiling the mine cars. The cost of maintenance and renewal of ties, rollers, sheaves, grips, etc., averaged over a period of months is approximately $25 per month, or $\frac{2}{10}$c. per ton of coal handled. This includes cleaning up wrecks, replacing derailed cars, etc. There is an average of one wreck per month, which takes two hours to clean up. Most of the wrecks occur on the curves. The total cost of running and maintaining the plane per ton of coal handled is:

	Cents Per Ton
Depreciation of rope	$0.70
Labor	2.25
Maintenance	0.20
Total cost	$3.15

Strength of Rope



The tension on the rope can be calculated in a simple manner by assuming it to be stationary and composed of two independent ropes suspended at the top of the drums. Then the point of maximum strain will occur where the rope supporting the loaded trips first comes in contact with the drums and the strain at this point will be the greatest just as the loaded trip has cleared the knuckle, and the rope is supporting 25 loaded mine cars plus the length of one rope from the drum to the tension carriage plus half the pull of the tension carriage. The other rope will be sustaining the same weight less the actual weight of the coal in the mine cars. The empty cars weigh 1200 lb. and the loaded 4000 lb., so that the total movable weight on the loaded side that the drum supports is:

	lb.
25 loaded cars @ 4000 lb. each	100,000
½ weight of tension carriage—6000 lb.	3,000
4000 ft. of rope @ 2 lb. per ft.	8,000
Total	111,000

The average inclination of the trips at that point where the tension on the drum is greatest is 18.8 per cent., or 10 deg. 39 min. The tension T on the rope due to the loaded trip is:

$T = W$ (sin a — cos a × Z) where
W is the weight of the loaded trip, 100,000 lb.
a is the angle of the plane, 10 deg. 39 min.
Z is the coefficient of friction equal to 1/20.

Substituting the above values in the formula and solving for T, we find that the tension on the rope due to the loaded trip is 13,568 lb. Morin gives the coefficient

Rope Grip for Incline

of friction of metal on oak as ½. Using this coefficient and W, the weight of the rope as 8000 lb., in the above formula, it can be shown that the dragging of the rope acts as a brake to the extent of 2453 lb. In the same way, it can be shown that the pull exerted by the tension carriage amounts of 1598 lb. The total tension on the loaded rope at its point of contact with the drum will be 13,568 plus 1598 minus 2453, or 12,713 lb., or 6.4 tons, which gives a factor of safety of 8.6 for the rated breaking strength is 55 tons per square inch.

The advantages claimed for this system are the low cost of installation, cheapness of maintenance, large capacity with minimum breakage of coal.

There was a fire at the Bold collieries in Lancashire. After the fire the pit was stopped three days, and the government inspector and everybody made as thorough an investigation as possible in the hope of finding out the real cause. There was a large stack of timber at the place,, and also a built chock of timber to support the roof at the top of a brow. It was there that the fire originated, and the only conclusion they could come to was that someone had hidden some matches there, and the weight had come down and set them off.

Engineering Practice of the Consolidation Coal Co.--Office Methods

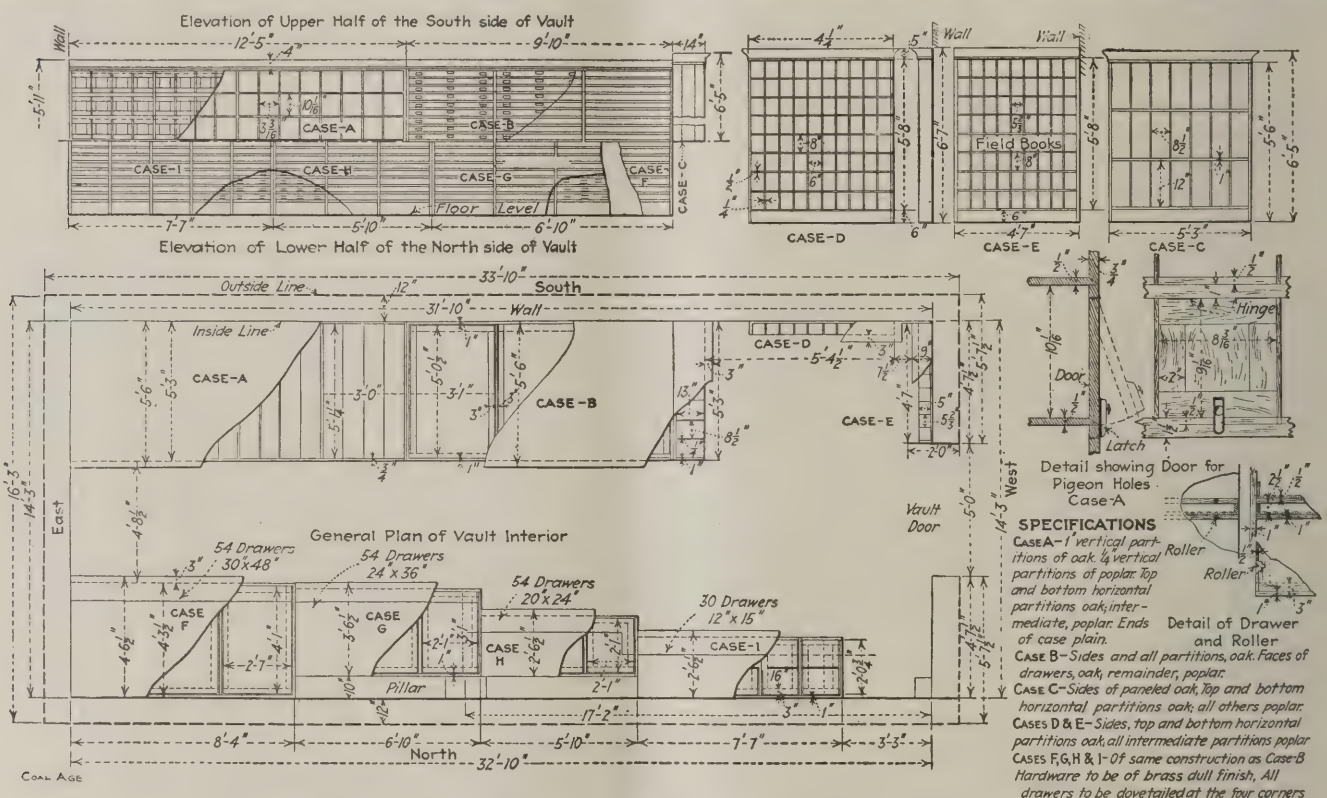
By A. W. Hesse*

SYNOPSIS—A description of the office methods of the Consolidation Co. The work is subdivided along very comprehensive lines as is necessary in a large organization of this character. Elaborate blueprinting and photo-reduction apparatus are part of the equipment. Unusually thorough methods of preserving and filing office records are used.

In the engineering department of the West Virginia Division, the Consolidation Coal Co., there are employed forty persons, most of whom are assigned to the six divisions comprising this department. Four divisions handle the work connected with the mines and the respective allotted territories, the outside division being given general and miscellaneous work, while the sixth division or drafting department handles special drafting and photographic work.

To each division is apportioned separate office space, so that its particular work will not become confused with that of some other section. Tables, instruments, calculation books, traverse and acreage sheets are all arranged so that no division interferes with the other in its work; and calculations, traversing, map work, tracing and miscellaneous duties are performed by the parties forming this division.

The office work, or what may be termed as such, of this department, may be classified under the following headings:



First—Computations.
Second—Mapping and Tracings.
Third—General Drafting and Indexing.
Fourth—Photographing and Printing.
Fifth—Miscellaneous.

Computations

In all the surveys (as previously explained in Coal Age) there are horizontal distances, latitude and longitude differences to calculate, and the traverse sheets to make up. If a property has been surveyed, or an outside boundary line located, this being done by locating the corners of the property from survey lines not co-inciding with the boundaries of the property, coördinate values must first be obtained of the property corners and the courses and distances between these corners calculated.

It is a rule of the department that all property corners along the outside boundary of our properties, or of special importance, must each be located from two stations of the random survey to avoid error in location. After all the available courses and distances are calculated between the known or located corners, they are compared with the deed of that property and an average of the differences taken for a correction on the remainder of the calls requiring traversing. The traverse is then made between located corners with the corrected calls.

But discrepancies usually exist in the total latitude and total longitude differences, known as errors of closure. These are distributed among the latitude and long-

Plan, Elevation and Details of the Consolidation Co.'s Main Vault

*Assistant chief engineer, Consolidation Coal Co., Fairmount, W. Va.

itude differences in proportion to their lengths. Then from the adjusted latitude and longitude differences, new courses and distances are calculated between the unlocated corners. After these new coördinates are obtained, attempts have been made, and sometimes with success, to find the corner in the field by calculating a course and distance from survey stations to these calculated corners. The property sheet herewith illustrates my explanation.

After all the courses and distances have been established beyond any reasonable doubt, they are placed on acreage sheets, also shown herewith, and the acreage calculated by the double-longitude method.

Mapping and Tracing

Maps covering mine work and allotted territory are made by the same parties having charge of the survey of these mines. The map paper used is the rough, thick mounted "Paragon" paper of 58-in. width. It is usually bought in rolls of ten yards and cut off as required.

Before working on this paper, after a map size is decided upon, the piece is stretched out upon a table for several days, or longer if necessary, in order that it may be properly seasoned before the coördinate lines are blocked out. Also, when a certain territory is allotted to a new mine, before the lines are blocked out on the map, the coördinate values are obtained upon the extreme corners of the boundary in order to determine just which direction across the map to draw the first line.

This line is usually the longest on the map, and points are marked off corresponding to 1000 ft. (on the 100 ft. to the inch maps). After this is done, a beam compass is used to get perpendiculars to this line by the intersection method. Having drawn the perpendiculars, these likewise are marked off in 1000-ft. spaces and the block completed by drawing lines across these points. A 6-ft. beveled-steel straight-edge is used in this work, the lines being first put on in pencil and blocks carefully checked before finally established with drawing ink.

All survey stations are then plotted on from their coordinate values; the 18- or 24-in. parallel rule on rollers and the engineer's scale, graduated to fiftieths, being used in this work; these locations are verified by plotting or checking the course by protractor and measuring the distance between each pair of stations.

The blueprint tracings and the working tracings, from which acreages are calculated, are made from these maps by the members of the division to which these mines are assigned. Worked-out acreages and theoretical tonnages are likewise calculated by the respective parties.

General Drafting and Indexing

The drafting room is equipped with four 5x10-ft. drafting tables, which are so placed as to allow for a 3½-ft. passageway around the entire table, affording the draftsman free access to his work from all sides.

These tables are placed on two cabinets and substantially bracketed to them to insure rigidity. The cabinets are equipped with three sections of drawers, those in one cabinet being full length and half-length drawers in the other. The upper half-length drawers are fitted with locks, in which are kept the supplies and instruments of the draftsman. This same class of table is also installed in each division office.

The drafting room is 16x50 ft. in size, lighted by six

44½-in. by 7-ft. 10-in. windows arranged in pairs, while over each table are suspended two 40-watt "Tungsten" electric lights, additional portable stands and bracket lights being used when necessary. Full drafting room equipment is provided for topographical, mechanical and architectural work, and for enlarging or reducing drawings to various scales by pantograph.

Indexing of all drawings is handled by the drafting division. The accompanying print shows the arrangement of filing cabinets in the vault, which is built on the department's floor especially for this purpose. The sets of drawers for tracings are designated as cabinets *A, B, C, D* and *E;* in size ranging from *A*, the smallest, to *E*, the largest. In each cabinet an individual system of numbering is maintained, each beginning with number one, and every tracing is classified as belonging to a particular cabinet file by the use of the cabinet letter as a prefix, as A-1461, for example. In numbering the drawers, the number of the last tracing filed therein is used instead of the first and last being indicated, as is usually done; thus, if 100 tracings were in the first drawer of a particular cabinet, the number of the plate card would be 100 and the second drawer card 200, instead of 1-100, and 101-200.

Indexing

There are only two standard sizes for drawings; correspondence, which is 8½x11 in., and legal, 8x13 in. It has not proven advisable to further standardize, either from necessity or economy; but when making new tracings or drawings they are sized to fit drawers which will best accommodate them. All tracings are filed flat except when so large there is danger of crushing, or when very long and narrow. In these cases they are rolled on sticks and placed in the drawers they fit the best.

Drawers of the depth shown on the accompanying drawing will accommodate from 100 to 300 tracings, depending on size and age. For keeping the tracings in position it has been found better to place a fairly wide board of light wood, such as boxwood, on top of the tracings rather than the usual covering of tin across the back portion of the drawer. It frequently happens that the tracings are both new and old and not all the same size and in this case they are liable to work out of position and become crushed and torn between the edge of the tin strip and drawer partition.

Two indexes are employed; the progressive index, in which the numbers of all tracings are entered in consecutive order as they are placed in the file, and the classified index which is referred to when a particular drawing is desired. The progressive index provides against the possible repetition of file numbers, and from it a new indexing system may be inaugurated at any time. The classified or reference index is arranged as follows:

Mines—Meaning mine numbers, under which sub-divisions are shown the various tracings of mine workings, properties, etc.

Alphabetical, which is virtually a general division according to the first letter of the principal word in the title.

Mining Plants, including all structures and equipment pertaining thereto.

Property, under which heading all property maps are included.

Profiles, of whatever nature.

Photograph, Working and Blueprint tracings, under which headings have been grouped these particular classes of drawings as they are of the most importance and frequently used.

In addition to this general outline, there are several miscellaneous divisions. The positions of the various mounted mine maps in the pigeonhole cabinet are indicated by cards bearing the mine numbers, these being placed on the drop doors and no further indexing being necessary.

Photography and Blueprinting

All this class of work is usually handled by the drafting department. At the end of the year, the mine working maps throughout the region are reduced from 100 ft. to 500 ft. to the inch by copy-process photography. These maps are then bound in folios for the various officials. In order to obtain uniformity, these tracings are brought up to date by the drafting department, and then photographed on 11x14-in. plates. In all, about 150 plates of this size are used throughout the year, from which about 3000 prints are made.

The studio room in which this work is done, is the largest of the three communicating rooms, reserved for photographic work, being 18x30 ft. in size, with an overhead skylight 9x17 ft. There are four large windows, arranged in pairs on either side of the room and in line with the skylight. Mercury vapor lights are used for artificial lighting.

Curtains are provided, properly fitted with rings, and so arranged that the overhead and side light can be controlled to the best advantage at any time of the day.

The arrangement of the photographic apparatus in this room is designed specially for copy-process work; the maximum limit of reduction by any one operation being 1 to 10.

The exposure board, upon which the tracings or print to be photographed is securely fastened by thumb-tacks, is 5x8 ft. in size, and constructed of the best grade of seasoned white pine. It is mounted on a special carriage by pivot supports, their position being such as to distribute the weight of the board enough past center to provide for either a horizontal or vertical stationary position as required.

A 11x14-in. camera, fitted with anastigmat lens, and mounted on a cabinet stand (used for supplies, loaded plates, holders, etc.), is moved to any desired distance from the exposure board upon a triangular shaped steel rail track, this being accomplished by means of a chain gear attachment to the stand operating on a milled third or center rail.

The sliding door between the studio and the enlarging or general supply room, is used as a support for the enlarging camera. An opening in the door panel, exactly fitting the enlarging camera box, is used for the transmission of artificial light, mercury vapor lights being generally used for this purpose. The exposure board for enlargements is 5 ft. 2 in. square, fitted in a stand 12 in. from the floor. The window in this room is fitted with orange-colored glass, and provided with inside shutters so that all light may be excluded when necessary. The enlarging room is 18x20 ft. in size, but a portion of this area is included in the dark room, entrance to this being directly from the enlarging or supply room.

There are two cabinets in the enlarging room, which are of special design and intended for the preservation of chemicals, negatives and various photographic apparatus. The first, or chemical and mixing cabinet, in addition to the uses implied by its name, is also used for the storing of plates, the lower portion of the case being adapted to this purpose. The second, or negative cabinet, is fitted with shelves which are properly partitioned to accommodate 6½x8½-in. and 11x14-in. negatives in the upper part, the lower being used for the storing of photographic apparatus pertaining to enlarging work.

The Blueprinting and Dark Rooms

The dark room is located on the northeastern corner of this floor, with the dark-room window facing the east. This window is fitted with sliding doors of full length, frosted orange and ruby glass, with wooden dark-room shutters on the inside, the interior of the dark room being painted dead black. This room has a concrete floor, printing box, properly fitted dark-room light-box, water filter, hinged wall drop-leaf table and a cabinet especially designed for the uses peculiar to dark-room work in the handling of negatives, storing of printing paper, trays, holders and the like; it is provided with a ventilator, dark or blind entrance, electric lights and is steam heated. Two 18x36-in. sinks, 6 in. deep, are supported by a built-in framework extending across the entire width of room on the east side, provided with proper draining and splashboard equipment, and located 3 ft. 4 in. above the floor. This room is 8 ft. 6 in. in width and 17 ft. long, including the blind entrance above mentioned. A shelf for the accommodation of the chemicals most frequently used in dark-room work, a developer cabinet beneath the developing table, for stock solutions, and a full line of graduates, trays, fixing and washing boxes, etc., constitute the equipment.

The blueprinting room is 24 ft. 10 in. wide and 38 ft. 8 in. long, lying in parallel to the photograph department rooms. There are four large windows fitted with orange glass for properly subdued light in addition to the electric lights which are used for direct lighting. A concrete floor 6 ft. in width extends from one end of the room along the side wall for a distance of 25 ft.

The washing tank is equipped with hot- and cold-water spigots, lined with copper, and is 5 ft. wide, 10 ft. long and 10 in. deep, allowing for 8 in. of water up to the overflow standpipe. A table 5x10 ft. in size is mounted on wooden horses, and fitted with a center drawer for keeping supplies.

The table for sizing the unexposed printing paper is 4 ft. 2 in. wide and 8 ft. long. It is also fitted with a center supply drawer, and is mounted on two cabinet stands. The interior of these stands is divided into compartments for storing sensitized printing paper of all kinds, in addition to which, metal tubes are secured to the edges of the table, in which an entire roll of paper may be placed and the amount desired for a print is measured and trimmed off automatically without danger of exposure during the process.

The blueprinting equipment consists of an electric cylindrical blueprinting machine accommodating tracings 42x72 in. in size, and two 36x60-in. sun frames. The latter are mounted on portable carriages and tracks so that the loaded frames may be moved out on the roof and exposed at any angle. Plate holders for making prints 6½x8½ in. and 11x14 in. are used when such prints are required.

In addition to the copy-process photographic work, there are numerous pictures taken of the various improvements about the mining plants throughout the year, comprising interior, landscape, commercial and flashlight photographic work. In this work a 6½x8½-in. plate is always used, and about 1000 prints of these negatives are required throughout the year.

An inspection of our blueprinting record for work done during the past year shows that 42,960 ft. of printing paper of various kinds was used, or about 8.1 miles.

Miscellaneous

Under this heading is included the compilation of the annual report, abstracting, complete file index record of deeds, agreements, etc., analysis of cost statements, and numerous odd jobs which are constantly arising.

Each year the various divisions, of which there are five, assemble the data of interest and importance on their division and forward it to the Fairmount office where it is compiled, pages properly numbered and indexed and bound in a volume as an annual report. Nineteen of these reports of 560 pages each were made up for the year 1913.

This department keeps copies of all the deeds, leases, agreements, etc., of the coal and surface conveyances, all of which are filed and indexed in this office, and maps made showing the various fields with the index numbers on the tracts included. Frequently abstracts are made of properties to show the exact condition of the title, to which are attached colored plates to assist the reader in following the conveyances.

The Kanawha Labor Agreement

SYNOPSIS—This wage agreement penalizes idleness in violation of the scale, provides for a nine-hour day, grants a check off, excludes certain employees from the union and requires that the workers during strikes shall perform all necessary work except the mining of coal for shipment.

This agreement was submitted to the miners and approved on July 15, 1914. It supersedes the tentative agreement of the operators and miners arising out of their combined acceptance of the second proposal of the commissioners of conciliation. Details regarding the history of the strike, the conciliation, the agreement and the area it affects can be found on pp. 973 and 975 in the previous volume and on pp. 21, 22, 69 and 113 of the present volume. The document has not been reproduced in its exact words, but it is believed that its meaning has not been changed nor have its provisions been in any way abridged in this reprint.

Articles of Agreement

Memorandum of agreement, made and entered into this 11th day of July, 1914, by and between the operators of the Kanawha District of West Virginia and the United Mine Workers of America, governing the operation of mines in the said district for the period ending Apr. 30, 1917.

The scale prices of the 1912-14 agreement are hereby reaffirmed with such additions as are recommended below and these additions are hereby made a part of the scale as follows:

It is agreed that the present prices paid for labor between the drift mouth and the mine tipple—that is to say men working in, on or around said tipple—shall constitute the scale of wages to be paid during the life of this contract.

Drawing pillars by pick in the gas seams shall be left to local adjustment by the operators and miners interested but the rate agreed upon for said drawing of pillars, shall in no case be less than 40c. per net ton. Drawing pillars by pick in the splint seams shall be left to local adjustment by the operators and miners interested but the rate agreed upon for said drawing of pillars, shall in no case be less than 46c. per net ton. No yardage is to be paid in air ways following entries and breakthroughs where the width exceeds 15 ft.

It is agreed that negotiations for a new contract shall commence 30 days prior to the expiration of this contract.

It is further agreed that if at the end of 30 days after the expiration of this contract, a completed contract has not been agreed to, that the disputed point shall be submitted to the scale committee of the operators' association and an equal number of miners; which committee and miners so selected shall decide the matters in dispute within 30 days from the time of submission and in the event that either the miners or operators are not satisfied with the decision rendered they or either of them have the right to revoke the same. It is expressly understood and agreed that during all such negotiations the mine workers shall continue at work and the new contract shall be retro-active to the expiration of this contract.

The rules as amended and the scale with the changes named above are hereby made a part of this agreement.

Rules

CHECK-OFF

There shall be a check-off for dues and assessments only, not exceeding $1.10 per month or 55c. per pay collected by the coal companies which are parties hereto, from those for whom the scale is made. This check-off shall be collected only on the voluntary individual order of the person from whose pay it is deducted and shall be subject to revocation by those who no longer wish to pay the same; such order or orders of revocation with list of same must be in the companies' hands 24 hr. prior to the expiration of each half month.

(a) All assessments must be levied by the national or district organization of the United Mine Workers of America.

(b) The check-off herein provided shall be collected after store, house rent and smithing charges have been paid.

(c) Only moral suasion shall be permitted in influencing men to pay dues or to join the union.

(d) The form signed by each person desiring collections made shall be as follows:

To.....Co.:

Please pay to the authorized agent of Local Union No. .... of the United Mine Workers of America, the sum of 55c. each two weeks out of my earnings or $1.10 for each month while in your employ until this order is revoked. The money thus collected is to serve as dues and assessments to the United Mine Workers of America.

.....

Dated .....

Witness.....

MACHINE WORK

2. The price paid for loading coal after machines in narrow work, by the ton, shall be, if the operator so desire, the same as in wide work; the excess price now paid for loading to be paid on a yardage basis according to the number of tons of coal produced in each yard of narrow work.

3. Machine men will be required to cut coal level and close to the bottom, and all machine men leaving more bottom than 4 in., except in case of pots or extreme variations of level, will be required to lift same or it shall be lifted at their expense.

4. In case sprags are left by the machine men, the latter shall be notified by the loader, and if they refuse to remove same, the loader shall do so and be allowed 50c. for so doing; the said 50c. shall be charged to the machine men.

5. All machine loaders shall be awarded two rooms, or the equivalent of three rooms in thin seams, for each two men, and they shall work as "buddies," and in that way load from one room at a time, so that it will give an opportunity to cut the other room, and so that no time will be lost by machine or loaders. The operator will provide such rooms for each two men at the earliest possible moment, but in the event of territory becoming scarce from a squeeze or when striking a horse-back, or any other unavoidable obstacle, this clause shall not be construed so as to diminish the output of the mine.

CHECK-WEIGHMAN

6. Check-weighmen, selected as required by law from among the employees at any mine, may be placed on each tipple at the expense of the miners, and their duties shall be only those prescribed by the laws of the State of West Virginia, and all weigh scales may be tested by the miners at any reasonable time. In case a suitable man cannot be found at any mine an outsider may be employed by and with the mutual consent of the operator and his miners.

TRADE

7. Employees have the right to trade where they please.

RUN-OF-MINE OR SCREENED-COAL BASIS

8. The mining rate per ton for splint or hard coal shall be fixed upon a run-of-mine basis, but screened-lump coal may be mined provided the increased rate paid for screened-lump coal shall be according to the percentage of screenings in producing screened-lump as against mine-run coal.

HIRE AND DISCHARGE

9. The operator or his superintendent or mine boss shall be respected in the management of the mines and the direction of the working force. The authority to hire and discharge shall be vested in the mine superintendent or mine boss, and nothing in this agreement shall be construed to abridge the rights of the employer in either of these respects.

LOADING CARS OR BARGES

10. The operator shall at all times be at liberty to load with coal any railroad cars or barges whatsoever, regardless of their ownership, and sell and deliver such coal in any market, and to any person, firm or corporation that he may desire.

NINE HOUR DAY

11. Nine hours shall constitute a day's work: 9-hr. day means 9 hours work at the face, exclusive of noon-time, 6 days or 54 hr. a week, provided the operator desires to work the mines, and no local ruling shall in any way affect this rule or impose conditions affecting the same, and any class of day labor may be paid, at the option of the operator,

for the number of hours or fraction thereof actually worked at the hour rate, based on one-ninth of the scale rate per day, except that when the day men go to the mine in the morning, they shall be entitled to two hours work whether the mine works two hours or not, provided that the failure to operate the mine is not the result of men being out or declining to work. If for any reason the regular routine work cannot be furnished to the inside day labor for any portion of the first two hours, the operator may furnish other than regular labor for the unexpired time.

12. All classes of labor are to work full 9 hr., and going to and coming from their respective working places is to be done on their own time. All day men shall perform whatever day labor, the foreman may direct, and a nine-hour day means 9 hr. work in the mine at the usual working places, exclusive of the time required in reaching said working places in the morning and departing from the same at night.

Drivers shall take their mules to and from the stables and the time required in so doing does not include any part of the day's labor, their time beginning when they reach the change where they receive empty cars and ending at the same place. The prevailing customs relative to harnessing and unharnessing their mules shall continue.

SEMI-MONTHLY PAY

13. All labor shall be paid semi-monthly. Semi-monthly pay means that the miners shall be paid twice a month, pay days to be determined locally, and statements shall be available 24 hr. prior to pay day.

MINING—WORKMANLIKE METHODS—TIMBERING

14. The miner shall be required to load his coal in every case free from slate, bone, nigger-head and other impurities.

15. All coal must be mined, drilled and blasted by the miners in a practical and workmanlike manner and in accordance with the state mining laws of West Virginia.

16. In paying for coal before it is screened, it is not intended to encourage unworkmanlike methods of mining and blasting coal, or to decrease the proportion of screened lump, and any miner will be subjected to discipline who, from ignorance, carelessness, or any other cause, fails to mine, shoot and load the coal properly.

17. The scale of prices agreed on for mining coal shall include the work required to mine, shoot, clean and load the coal, and timber the working places in the mines properly, and the operator shall be required to furnish the necessary props and timber to timber all working places properly.

18. If any miner shall fail to timber properly and care for his working place, and such failure shall entail falls of slate, rock and the like, or if, by improper and reckless shooting of the coal in room or entry, the mine props or other timbers shall be disturbed, or unnecessary falls result, the miner whose fault is the occasion of such damage, shall repair the damage without compensation, and if such miner fails to repair such damage, it shall be considered a dischargeable offense, and he may be dealt with at the discretion of the superintendent.

19. In any case where the mine boss directs the placing of crossbars to secure the roadway, then and in such cases only, the miner shall be paid prices for such cross bars as may be agreed upon between him and the mine boss. In case of miners shooting bottom, should any of the props be loosened or displaced, thereby endangering the safety of the workmen, the miner agrees to reset same. The above does not contemplate any changes from the ordinary method of timbering by the miner for his own safety.

DOCKS

20. In case any slate, bone, sulphur or other impurities are sent out by the miner, it shall be the duty of the trimmer of the car to call the attention of the weighman, and checkweighman where one is employed, to the same, so as to deduct the weight of such impurities as estimated by the trimmer or dock boss from the ascertained weight of such car; for the second offense he may be suspended for one working day or fined 50c.; for the third and each subsequent offense occurring in any one calendar month, he may be suspended, discharged or fined $1 at the option of the superintendent. In malicious and aggravated cases, the superintendent shall have the right to suspend or discharge for the first or any subsequent offense.

21. Any miner abusing, or seeking to embarrass the trimmer from performing his duties shall be fined $3, or be discharged at the option of the superintendent.

22. It is understood that if the checkweighman leaves his post to investigate the amount of impurities thrown out, or for any other purposes, the running of the coal over the tipple will not be suspended during his absence.

23. Splint coal loaded out with gas coal, when it is ordered to be separated, shall be considered as impurities and shall be dealt with as such.

24. The proceeds of all fines arising under this clause to be paid into the funeral fund. Under no circumstances shall the fines be remitted or refunded.

MINE COMMITTEE—GRIEVANCES

25. The duties of the mine committee shall be confined to the adjustment of disputes that the mine boss and miner, or miners, have endeavored but are unable to adjust.

The mine committee shall have no other authority nor exercise any other control, nor in any way interfere with the operation of the mine, and for violation of this clause the committee or any member thereof may be discharged.

25-a. In case of any local trouble arising at any mine, the aggrieved party shall first make an earnest effort to adjust the dispute with the mine foreman. In case they are unable to agree, the matter shall be referred to the mine committee and the local management of the mine, and if they fail to agree, to the commissioners of the miners and operators' association, and if they fail to agree, to the district board of the two organizations, and should they fail to agree, they shall select an umpire or referee, and the decision of a majority of them shall constitute a final and binding award. In all such cases all parties involved must continue at work pending the investigation and adjustment as above set forth.

25-b. If any employee for whom the scale is made refuses to work because of any grievance which has not been taken up in the manner provided herein and such action shall seem likely to impede the operation of the mines, such employees or any of them will subject themselves to dismissal without recourse at the option of the company, and the mine committee shall immediately furnish a man or men to take such place or places at the scale rate in order that the mines shall continue at work, and it shall be the duty of any member or members of the mine workers who may be called upon by the mine boss or mine committee to take immediately the place or places assigned him or them in pursuance hereof.

25c. The mine committee shall under no circumstances go around the mine for any cause whatsoever unless called upon by the mine boss or by the miner or day man who may have a grievance that he cannot settle with the mine boss and then only to investigate that grievance with the parties involved.

25-d. Members of mine committee employed as day men shall not leave their places of duty during working hours except with the permission of the mine boss or in cases involving the stopping of the mine.

25-e. Any employee or employees guilty of throwing the mine idle or of materially reducing the output of the mine by failing to continue at work in accordance with the provisions of this agreement, for the purpose of enforcing some demand in violation of this agreement or to force a decision of some case in dispute by methods other than as provided for herein shall be fined $1 each for each day so idle. All fines collected as above shall be paid to the treasurer of the Kanawha Coal Operators Association; such fines to be distributed from time to time for charitable purposes by the presidents of the two organizations, and under no circumstances shall any fines so collected be refunded except when mutually agreed to by the two organizations.

NEGOTIATIONS DURING SUSPENSIONS

26. Under no circumstances will the operator recognize or treat with any representative of the United Mine Workers of America during the suspension of work contrary to this agreement.

WORKING IRREGULARLY

27. Should any employee absent himself from his work for two days or persist in working irregularly, unless through sickness, or by first having notified the mine boss and obtained his consent, it shall be construed as a dischargeable offense; and in case of sickness it is the duty of said employee to notify the mine boss at once in order that arrangements may be made to fill his place.

TURN

28. The operator will see that an equal turn is offered each miner, and that he is given a fair chance to obtain same. The check-weighman, where one is employed, shall keep a turn bulletin for the turnkeeper's guidance. The drivers shall be subject to whoever the mine boss shall designate as turn-keeper in pursuance hereof. This rule is not applicable, and shall not be considered as preventing the operator from driving entries as rapidly as he may desire.

DOUBLE SHIFTING ENTRIES

29. Miners shall drive double-shift entries when called upon to do so by the operator, and 25c. per yard extra shall be paid for pick entry and 20c. per yard for machine entry.

BURIAL FUND

30. A burial fund may be established by each mine or local, to which fund each miner shall contribute 25c. per month until a sum of not less than $75 and not more than $150 shall have been created, when collections shall cease until the fund is reduced by death, when a collection of 25c. per man per month shall again be made until the amount reaches the maximum agreed upon, and so on, and the operator shall contribute in case of death of miner, or any member of his family, an amount agreed upon by the operator and the Burial Fund Committee. In consideration of this contribution, it is agreed and understood that the miners and day men will not cease work to attend the funeral of either miner or member of the miners' family. However, if a miner is killed outright while at work in the mine, the mine may be closed the day of his death, but it shall resume work the following morning. This is not to be construed to mean that individual mine workers or relatives of the deceased shall not attend the funeral if they desire so to do.

31. There shall be a committee appointed known as the Funeral Fund Committee to take charge of these funds, and make all necessary funeral arrangements in case of any death, and said committee shall be paid for such duties as may be agreed upon locally.

ENTRY GOB

32. Where there is not sufficient room to gob the dirt and draw-slate in entries with ordinary conditions the loader or miner shall load it in bank cars and the company shall unload it.

MEMBERSHIP IN U. M. W. OF A.

33. The following employees are not eligible to membership in the United Mine Workers of America; Mine boss, inside boss, weighman, dock boss or boss trimmer, stable boss, electrician and night watchman.

34. It is understood that in the event of a disagreement between operators and mine workers, steam and electrical engineers, firemen and pumpmen are required to continue to perform such work as is in line with their duties.

TRACK-LAYER

35. No mine shall be compelled to hire more than one man as head tracklayer; all others shall be known as helpers, and so paid, and all helpers shall be expected to do such work as is laid out for them by the head track-layer.

DEAD-WORK—LOCAL CONDITIONS—INCREASE IN COST

36. For dead work where unusual conditions exist, the price to be paid for same shall be a question for local adjustment, but no local demand shall be made that will increase the cost of coal during the life of this agreement unless mutually agreed upon.

37. Under the terms of this contract nothing shall be done or enacted that shall increase the cost of producing coal to the operator, or decrease the earning power of the mines, except by mutual consent.

38. During any strike or suspension, it is hereby understood that all men on all kinds of outside construction and repair work, together with all men at such kinds of work inside the mines as does not produce coal, must continue at work; and it is further understood that such miners as are necessary are to be permitted to mine coal for the boilers and domestic consumption on the property; but this is not to be construed to mean to mine coal for shipment.

SPLINT COAL SEPARATION

39. Where splint coal is separated and thrown back, to meet exceptional market conditions and afterward loaded, there shall be paid 12½c. per ton extra.

DAY WAGE SCALE

40. Though in many cases a higher wage than the Kanawha scale is paid for day labor, the right is reserved to apply the Kanawha scale for day wages should the companies elect to do so.

41. All local rules in violation of this contract shall be null and void and no local union or group of local unions shall pass any rules which violate it, neither shall any company enforce any rule in violation of this contract.

Scale of Prices

Basis—Ton, 2000 Pounds—Run of Mine

KANAWHA THICK VEIN NO. 1 AND 2 SEAMS	
Pick mining	$0.49
Pick mining, Powellton seam	0.46¼
Yardage in pick entries and breakthroughs between entries	1.08¼
Machine loading in rooms	0.26
Machine loading in entries, breakthroughs in entries and room necks	0.31
Machine cutting in both rooms and entry	0.06½
KANAWHA HARD COAL NO. 5 SEAM	
Pick mining	0.51
Yardage in pick entries and breakthroughs between entries	1.19
Machine loading in rooms	0.27
Machine loading in entries and breakthroughs in entries and room necks	0.31½
Machine cutting in rooms	0.07
Machine cutting in entries and breakthroughs between entries and room necks	0.08
Screened coal to be paid on basis of percentage of screenings	
COALBURG SEAM—RUN OF MINE	
Pick mining	0.56½
Yardage in pick entries and breakthroughs between entries	1.35
Machine loading in rooms	0.32½
Machine loading in entries and breakthroughs in entries and room necks	0.37

The Labor Situation

SYNOPSIS—There has been no marked development in the labor situation. The strike of the Lackawanna employees still threatens. That in Ohio drags along wearily, the participants suffering much destitution and many of the mines having been flooded. The men driven from Prairie Creek, Ark., by the rioting Union men are also destitute and their families are, in many cases, scattered. The Western Federation of Labor may unite with the United Mine Workers of America. The Scotch miners desire a 4-day week.

The dispute regarding the patrolmen of the Delaware, Lackawanna & Western R.R. coal department has reached a menacing stage. Colonel R. A. Phillips, general manager, recently refused to treat further with the miners on the subject. On July 18, the general grievance committee of the Lackawanna miners met in West Scranton and voted unanimously in favor of a strike at all Lackawanna collieries unless the company officials agreed to discontinue the patrol system. The meeting was attended by 72 men from 18 different collieries, employing more than 10,000 men. The question was referred to the locals for ratification where the referendum vote was everywhere favorable. It did not, however, provide for a strike, but only gave the general grievance committee power to call one at any time.

It has been quite generally thought that the action of the company in closing its collieries recently for short periods arose not from lack of orders, but from a desire to let the miners have an early foretaste of the idleness they are seeking. If that is really so, which is somewhat unlikely, for business is now facing the regular summer dullness, the company could hardly be blamed, because the strike against the patrolmen is a flagrant violation of the agreement and should subject the union to suit by all the regular laws of business. The company, however, is disposed to treat with its men despite the earlier declaration, and on July 22, Col. R. A. Phillips, the general manager, had a conference with D. Fowler, the chairman of the grievance committee.

It will be remembered that in accord with James E. Roderick's suggestion, a safety patrol was inaugurated at great expense to the company. The miners said the men were spies and demanded their discharge. The local grievance committee has so far acted on its own authority, John T. Demsey, the president, participating in only one of the meetings. It is doubtful whether the organization will support the miners, and it is believed that the company may seek an injunction to prevent a strike which violates the agreement entered into by the company with the United Mine Workers of America.

The safety patrol, known by that or any other name, has been the most successful means of reducing accidents, having been adopted also by the U. S. Steel Corporation's affiliated coal companies, the Lackawanna Steel Co. at Ellsworth and Cokeburg, and the Susquehanna interests in the anthracite region. It has and deserves the approval of every mining man and has always been proved to reduce accidents.

Safe practices are sometimes burdensome and the insistence on them annoying, but if the miners rise against safety inspectors they deserve and will receive the unstinted condemnation of the public, and the responsibility of the coal companies for accidents will be largely removed.

LAW BREAKING IN ARKANSAS

Lawlessness still continues in Arkansas and there is a disposition to criticise Attorney-General McReynolds for the preliminaries which led to the present situation. It has been altogether too general in the past to take the easy way in dealing with disorder and to wait till threatening and manhandling turn to arson and murder.

The head of the attorney-general's department had, it appears, ample warning. The mines at Prairie Creek are surrounded by several others in which are about 2000 union miners. Nearly half of these work in the mines of the Central Coal and Coke Co., which are located in the same valley and surround Prairie Creek on three sides.

On April 6, fully 1000 miners from the Huntingdon and Hartford field marched to Prairie Creek mine and sent a committee to confer with Superintendent Cameron. Haulage ropes had been stretched around the plant and the crowd surged around this barrier. Friction with the mine guards caused an outbreak and four employees were beaten. The superintendent had to withdraw his men from the mine and to put out the fires under his boilers.

THE INJUNCTION OF THE U. S. COURT

Now the statement of these facts might be considered biased, but the judge of the U. S. Court was so impressed with the evidence on inquiry that he made a temporary restraining order, later making it permanent, and he told the Mammoth Vein Mining Co. not to operate without notifying him. On notification, 50 U. S. marshals were sent to guard the mine. James C. McReynolds, the attorney-general immediately ordered them simply to observe the conditions and not to police the mines.

McREYNOLDS' ORDER RESULTS IN VIOLENCE

The marshals were ultimately withdrawn, and the operators, realizing the danger, hired about 125 guards. Those men, for some reason or other, failed to resist the force brought against them and 4 tipples, 2 fan houses, the commissary and boarding house were burned down. Two men were shot and their bodies incinerated so that their skulls and bones were all that was found of them when exploring the burned ruins of the log cabin in which they had been murdered. On the 20th of June, the Coronado tipple was also dynamited and destroyed.

Yet we find people who oppose injunctions and desire the lawless to complete their violence before they are restrained. All that is now needed to complete the farce is to send a few troops to prevent the Mammoth Vein Mining Co. from hiring any men to replace those who have been driven away. We suggest this only because it has been done already in Colorado. If we had not that example before us, we would label such an action "unthinkable," but a labor administration is liable to wink at every manner of violation of the constitution.

The men driven out of Prairie Creek have been separated from their families and are afraid to go to seek them. Most of them are destitute. The Bache-Denman Coal Co. is taking care of most of them, but unable to obtain work in the union mines and with the nonunion plants dynamited and burned down, their situation is deplorable for men in a free country.

PEACE IN OHIO

In Ohio the companies are still anxiously desiring to pump out the water from their mines. The Cambria Mining Co. July 20 started its pumps and fans at Pultney and Webb. Sheriff Anderson brought 50 armed guards to the Pultney mine, but the Webb mine was policed by private guards. The Fort Pitt mine is relying on Sheriff Anderson to supply deputies. Some of the I. W. W. agitators are in prison and the fever heat of the irresponsible miners has consequently declined.

In fact the awakening of Sheriff John Anderson has relieved matters considerably in Belmont County. He has inquired of Attorney-General Hogan whether men could legally be employed to protect mine property, and, of course, the attorney vouchsafed him the information that it was lawful and an obligation under conditions such as exist in his county. So Anderson recruited 150 miners to protect the pumpers and engineers. They were assigned to duty at the mines at Wheeling Creek, Lansing, Barton and Neff, and with the pumping forces working under their protection, it is expected that the mines can be kept in good shape until work is resumed.

It is reported that many of the Industrial Workers of the World left the county disgusted. Joseph Knoblocks, an I. W. W. agitator, is charged with treason. It is declared that he has levied war against the state, and that he has adhered to its enemies, giving them aid and comfort, and also he has failed to give information in his possession of impending acts of volence against the state and the public. The charge is unusual, but it is declared by officers that it can be fully substantiated by facts.

JACKSON DISTRICT TO WORK, OTHER DISTRICTS IDLE

Despite the efforts of operators to have the miners return to work under a temporary arrangement as to weighing both lump and slack coal, the miners in the Hocking Valley district held out all last week and demanded that all the coal be weighed at one time. Conferences of the scale committee of this district started July 20 and lasted for the week.

In the Jackson district an agreement was made and work will be resumed at once. In the Cambridge district a number of the mines have resumed operations. Nothing has yet been done toward signing a scale agreement in the eastern Ohio district.

As a result of appeals to the people of Ohio and West Virginia, funds have been collected for the relief of the families of miners in the Ohio field affected by the recent strike, and commissaries have been opened in about a dozen of the mining towns from which free provisions and household supplies will be dispensed as long as the money holds out. It is said that the distress among the miners has in many cases become acute, rendering immediate relief imperative to avoid actual suffering and death from starvation, and the commissaries were opened to afford prompt aid.

Funds for the suffering striking miners and their families in Ohio have been asked for by the Ohio Federation of Labor at a recent meeting in Columbus. Reports from various districts of Ohio show that there is much suffering among the miners and their dependents, and in many cases subscriptions have been taken up in their immediate localities.

LATEST NEWS OF MINE SCALES

Settlements in Ohio districts are not materializing as actual agreements. Those who signed a mine-run contract on the basis of 47c. a ton have discovered that the local conditions are likely to prove as much an obstacle as was the general scale. Increases are sought for all classes of help and the miners have assumed the position that they made a big concession when they accepted 2c. less than the full demand of 49c., and they should not be asked to concede anything in the framing of local scales. This has delayed the opening of mines in the Hocking, Cambridge and southern Ohio fields. It also appears that the operators are not to be allowed to pay a mine-run scale by weighing three-quarter coal and slack separately, and adding the weights thus obtained. This procedure will be necessary while alterations are being made in the tipples at some of the mines and was sanctioned by the state union officials. ?

Tipples are generally squatty in the Hocking Valley, and it will require a month if not longer to rebuild them. In the meantime the operators hoped to mine coal and take advantage of the demand for steam grades.

The land owners are now objecting to coal being mined on the mine-run basis. All royalties, where paid, are based on three-quarter coal. The land owners are not willing in some cases to rearrange contracts on the mine-run basis because such mining will result in the destruction of the market and eventually will hurt the reputation and reduce the value of the fields. They also are asking more per ton under the mine-run scale than the equivalent of the old royalty on three-quarter coal.

Altogether the situation is not clearing up as rapidly as was hoped. It is frequently predicted that the No. 8 field will be producing coal before the troubles are all settled in other parts of Ohio.

John M. Roan, chief of the Ohio department of mines, denies that he said that eastern Ohio operators would sign the scale giving 47c. for machine-mined coal and 67.6c. for pick-mined coal. The quotations from his recent speech at Bellaire, Ohio, as given in the papers, were incorrect in that particular, according to his statement.

LOCAL DISPUTE IN WEST VIRGINIA

In West Virginia, in the New River district two small strikes were called. One is at Elverton, where 80 miners quit because the company refused to permit the employment of a check-weighman who, they declared, was incompetent. However, the matter was compromised, by putting the father of the elected weighman in the younger man's place. At Kaymoor No. 2 about 50 miners quit because they would not work with a man who had been a guard at the Loup Creek mines.

THE SOUTHERN CONFERENCE

News from Kansas City, where an agreement for the Kansas, Oklahoma, Missouri and Arkansas fields is being made, is scant. Committees consisting of 8 representatives of miners and 8 representatives of operators were formed for each of the four states. These committees will meet separately and provide different agreements for each state. The contract is to be for two years.

DISCONTENT WITH INDIANA AGREEMENTS

In Indiana the delegates from Linton, Clinton, Shelburn, West Terre Haute and Glen Ayr brought formal charges on July 22 against William Houston, president, and James Shiel, vice-president, respectively, of the 11th district of the United Mine Workers of America, also against Thomas Moss, a member of the district board. These charges allege violations of the working agreement in settling strikes. President Houston is charged with neglect of duty. The complainants desire that all three men be removed from office.

WEST KENTUCKY FIGHT

In Muhlenberg County, in Western Kentucky, there has been armed strife between the Bevier Coal Co. and the strikers at Cleaton. The employees of this company, as well as those of the Nelson Coal Co., are on strike, alleging that the employers have broken a contract entered into when the Western Kentucky Coal Operators' Association and the Union Miners met at Louisville in the spring, when the operators agreed to haul the men into the mines. The Bevier company has withdrawn from the operators' association and refused to provide the men with transportation.

The violence consisted of an attack, charged to the striking miners, on the quarters of J. P. Cox, superintendent of the company, at Cleaton. A charge of dynamite was exploded one night last week in the store over which Mr. Cox had his rooms, but Mr. Cox, with a bodyguard, which had been concealed outside, broke up the mob by firing buckshot into its ranks. It is said that 25 men participated in the attack. Five men are known to have been severely wounded and it is reported that one fatality resulted. The authorities are investigating.

COLORADO STRIKE NEARING CONCLUSION

The Colorado situation is unchanged except that as the union funds become more and more depleted, the more do the leaders allege defections of men working at the mines and the more fervently do they appeal for federal intervention. The Union is severely short of funds except in a few of the locals, and those which have the money are keeping it. So it is necessary to find another and better way to end the strike, and the new way sought is by nationalization of the Colorado mines.

It was announced the other day that Samuel J. Gompers, president of the American Federation of Labor, had been asked to head the movement, which shows that it is an impulse arising with the United Mine Workers Union. That Mother Jones and John W. Brown are advocating it seems also to suggest the source of the inspiration.

THE OPERATION OF MINES BY THE NATION

We are by no means either against public ownership of utilities or national socialism. We believe private property is only of value as it promotes happiness and prosperity, and we look, indeed, for a gradual assumption of federal control as time proceeds and socialism becomes not so much a mere creed to enforce on others as a private practice which the individual will enjoin on himself. In fact for socialism we need more socialists—men who aim alone at the social and not at their personal welfare. Such men are rare in all classes of society.

Just recently appeared the German report on insurance for 1913. The wages at the privately owned monopolistic coal mines in Westphalia are $402 per year. In Upper Silesia, the privately owned coal mines paid their men $280. The state coal mines at Saarbruecken paid $327. Thus the state employees received a wage 16 per cent. greater than the Upper Silesia corporation workmen and 19 per cent. less than the employees of companies in the Westphalia district. State ownership consequently, has not been of great benefit to these German coal miners.

THE MINING UNIONS TO COMBINE

The Western Federation of Miners met in its 21st Annual Convention at Denver, Colo., on July 20. President Charles H. Moyer, in his report, said that none of the officers in the Western Federation disapproved of confederation with the United Mine Workers of America. John McLennan, president of District No. 15, U. M. W. of A., called attention to the fact that his organization took steps favorable to the proposed merger at the last convention at Indianapolis, Ind.

From such a union the only gain will be increased numbers and larger funds with countervailing larger responsibilities and divergent interests. There is no real gain such as accrues when two bodies join which are engaged in regulating the same industry in competing fields. The U. M. W. of A. will hardly be any more of a trust when it absorbs the W. F. of M. than it is now, for it already is in undivided control of the unionized coal mines. While the W. F. of M. is even more disposed to violence than the U. M. W. of A., it is hardly likely that the affiliated body will make a perceptible difference in the conduct of strikes and the making and breaking of agreements between coal operators and men. In fact the W. F. of M. may gain in responsibility far more than U. M. W. of A. will lose.

THE SHORT WEEK

The Scotch miners desire to work only 4 days a week. This is 208 days a year, as against 225 days worked in the United States in 1912. If the rule is strictly enforced and bank holidays and days for funerals are not added, the Scotch miners will still work almost as steadily as is customary in America, but the working days will be better distributed. However, it has always been looked upon as a hardship in

America that mining work has not been more steady. In Scotland, there will be a certain loss of trade to foreign countries as a result of the 4-day week, and here, if we decided on such a short week, there would be no less idleness in the summer, so that the working days might fall to 150 per annum.

We hardly think that the standard of living is so high that the Scotch miners are to be commended for seeking the 32-hour week. If it is so, they are imposing on the working men in other trades who have to give a longer period for equal pay. If the hours are to be reduced the rule should be universal, and it is a grave question whether any of us desire to reduce the standard of living by such a considerable factor. If we deliberately reduce production, we must expect to have less products to divide.

The Fife and Kinross miners have given their notice to the number of 20,000 and the operators have declared for a lock-out. So immediate strife seems certain unless a European war makes one of the parties grant a concession.

THE CLAYTON BILL

The Clayton bill (H. R. 15,657), which passed the House June 5, has been favorably reported to the Senate after exhaustive deliberation and many amendments.

Section 2 was so amended as to permit discrimination in price . . . "made in good faith to meet competition and not intended to create monopoly," and also to permit the selection of customers "in bona fide transactions and not in restraint of trade."

Section 3, putting a restriction upon the sale of mine products, was stricken out.

Section 7, is amended by eliminating fraternal and consumers organizations, and inserting the word "lawfully" as applied to the carrying out of the legitimate objects of the organizations referred to. The section as amended reads as follows:

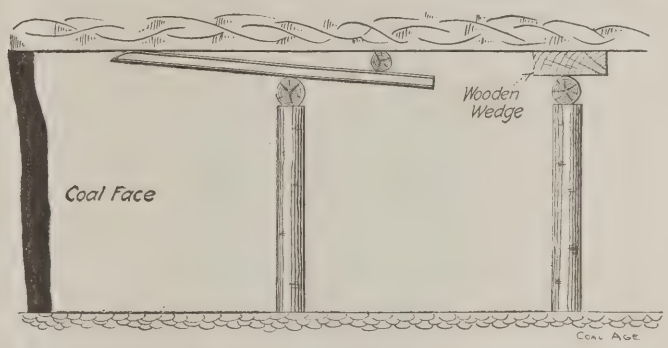
Sec. 7. That nothing contained in the antitrust laws shall be construed to forbid the existence and operation of labor, agricultural, or horticultural organizations, instituted for the purpose of mutual help, and not having capital stock or conducted for profit, or to forbid or restrain individually members of such organizations from LAWFULLY carrying out the legitimate objects thereof; nor shall such organizations or the members thereof be held or construed to be illegal combinations or conspiracies in restraint of trade, under the antitrust laws.

Section 18 is amended to read as follows:

Sec. 18. That no restraining order or injunction shall be granted by any court of the United States, or a judge or the judges thereof, in any case between an employer and employees, or between employers and employees, or between employees, or between persons employed and persons seeking employment, involving or growing out of, a dispute concerning terms or conditions of employment, unless necessary to prevent irreparable injury to property, or to a property right, of the party making the application, for which injury there is no adequate remedy at law, and such property or property right must be described with particularity in the application, which must be in writing and sworn to by the applicant or by his agent or attorney.

And no such restraining order or injunction shall prohibit any person or persons WHETHER SINGLY OR IN CONCERT from terminating any relation of employment, or from ceasing to perform any work or labor, or from recommending, advising or persuading others by peaceful means so to do; or FROM PEACEFULLY PERSUADING ANY person to work or to abstain from working; or from WITHHOLDING THEIR PATRONAGE FROM any party to such dispute, or from recommending, advising, or persuading others by peaceful AND LAWFUL means so to do; or from paying or giving to, or withholding from, any person engaged in such dispute any strike benefits or other moneys or things of value; or from peaceably assembling in a lawful manner, and for lawful purposes; or from doing any act or thing which might lawfully be done in the absence of such dispute by any party thereto; nor shall any of the acts specified in this paragraph be considered or held to BE VIOLATIONS of THE ANTITRUST LAWS.

Section 20 provides that trials for violations of injunctions "may be by the court or upon the demand of the accused by a jury."



Section 21 provides that judgments of conviction for contempt "may be reviewed upon writ of error in all respects as now provided by law in criminal cases."

The bill is now before the Senate and will soon be taken up for final consideration. The favorable amendments thus far made to the bill justify a hope that continued effort may secure further modifications which will be of advantage. Now if peaceful persuasion is prohibited to more than 5 men in a group, within 1000 ft. of a man's working place or his way of approach thereto and only one man is allowed to appeal to him at a time at his home, the Clayton bill will do a great deal to make injunctions unnecessary and violence less frequent. The difficulty of deciding whether persuasion is peaceable or the reverse has made the injunction necessary. By limiting either the number of persuaders or the necessary proximity of the victims to their forcible logic the freedom to contract and labor may be preserved to working men.

How the French Protect the Man at the Face

Practical Coal Mining describes an interesting method of forepoling in use at the Courrières colliery in France, the mine where the largest mine explosion in history took place. The method has been commented on favorably by George S. Rice, of the Bureau of Mines, who saw it in operation. An iron bar of girder section is pushed forward over the last cross-bar, so as in a manner to forepole the roof. When the place is advanced far enough for putting in other timbers and cross-bars, light laggings are substituted for the iron bars; these are temporarily supported by light props till the permanent timber sets are erected.

The bars are formed of I-section iron about 4 ft. long, 1¼ in. wide and 1¾ in. deep. The front or chisel end is made by heating the metal and hammering the top flange downward till it is welded to the bottom flange. The workman is allowed to leave unsupported only one

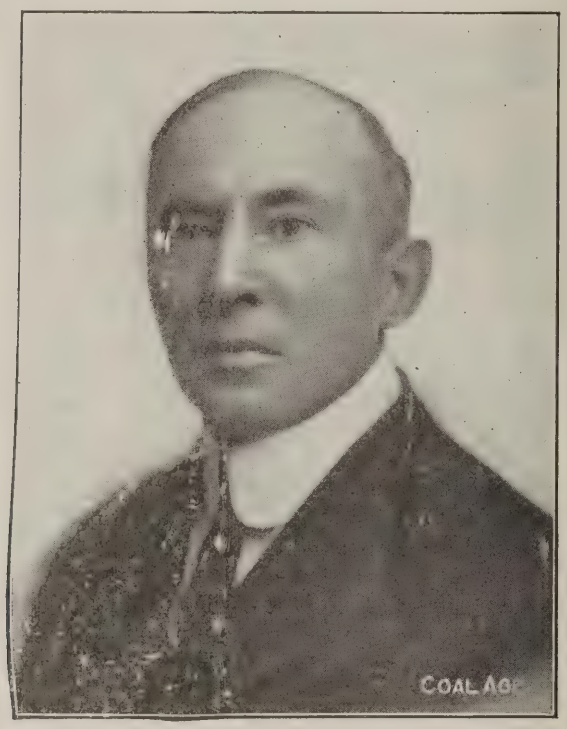
A Temporary Method of Securing the Roof at the Coal Face

foot of roof between the iron bar and the face. As soon as that distance is exceeded, the bar must be driven forward again. In driving through heavy falls, similar iron bars of stronger cross-section are used.

Only in this latter case probably would this French system meet American requirements, but in many places a slight and obvious modification would serve to add greatly to safety.

Coal Mining Institute of America

A meeting of the executive board of the Coal Mining Institute of America was held July 14, in the office of W. E. Fohl, Farmers Bank Building, Pittsburgh, Penn. The date of the winter meeting was set for Dec. 8-9, and the Fort Pitt hotel was arranged as the place of meeting. All the details of the program are not completely determined, though the groundwork is laid.



Early in the 18th century the mine light par excellence was a tallow dip set in a lump of wet clay. When gas tests were to be made, the experienced miner surrounded the wick of this brilliant light with more clay. The "fire man" of those days, prototype of the modern fire boss, must have been a man of much nerve and little caution, as his duty was to rid the mine of gas by firing it. Clad in damp leather or sack cloth, his work compelled him to lie prone on the floor and light the gas suspended in the air above him. If he survived the explosion he returned to the surface and reported the mine safe. Another method of disposing of gas was the use of "eternal lamps," kept burning continuously in gaseous mines to burn the gas as fast as it was generated.

Who's Who in Coal Mining

Jesse K. Johnston

Few men are more prominent in the affairs of the western Pennsylvania coal-mining industry than Jesse K. Johnston, of Wilkinsburg, Penn. He is the type of man who is able to handle matters other than those of a purely local nature, and for this reason his influence has extended beyond the limited sphere of his personal interests.

Mr. Johnston was born at Georges Station, Penn., Jan. 2, 1867. His mother was Louisa Kilgore, granddaughter of Capt. David Kilgore, who served with distinction in the Eighth Pennsylvania Regiment during the Revolutionary War. Pennsylvania history records the fact that Mr. Johnston's great-grandfather, Capt.

JESSE K. JOHNSTON

Kilgore, sold his mill property in order to secure sufficient money to clothe the military company under his command. For this act of generosity and patriotism, Capt. Kilgore never asked nor received compensation from the government.

But to return to the present subject of this sketch, Jesse Johnston. He was educated in the Greensburg High School, following which theoretical training he secured employment as topographer with the Pennsylvania Railroad. His next position was that of engineer with the Barberton Belt Line R.R. in Pennsylvania.

Mr. Johnston's first important work in coal mining was with the Pittsburgh Plate Glass Co., for which concern he served as general mine superintendent. Following in succession, he became president of the Lumberport Coal Co., vice-president of the Pitcairn Coal Co., president of the Charleroi Trust Co., president of the Charleroi Improvement Co. and president of the Coal Mining Institute of America.

While superintendent of the mine at Charleroi, he introduced electricity into his colliery, being the first superintendent in the Monongahela Valley to effect such an improvement. A second innovation introduced by Mr. Johnston was the plan of moistening the ventilating current in his mines by exhaust steam. He does not make claim, however, to having been a pioneer in the use of this particular safety precaution.

Mr. Johnston is a member of the American Mining Congress, American Institute of Mining Engineers, Engineers Society of Western Pennsylvania and the Coal Mining Institute of America. He has prepared a number of technical papers for presentation before coal institutes. Some of his most recent contributions are as follows: "Loss of Life in Coal Mines Compared with Other Hazardous Occupations," "Characteristics of the Thick Vein Freeport Coal Seam," "Safety Chambers in Underground Workings of Coal Mines" and "A Study of the Wages and Selling Price of Coal in the Pittsburgh District."

Anthracite Mine Fatalities

The death rate per 1000 employed in anthracite collieries has always remained about the same. The figures did not grow persistently higher up to 1907, as did those for the bituminous coal mines. Whereas, the bituminous mines are slowly regaining their former values, the anthracite region shows increased safety per ton produced and almost equal safety per thousand employed. The fact that the death rate has by one method of calculation barely increased and by another and more correct method has actually decreased, is due largely to the efforts of the operators and first-aid men to reduce accidents.

From 1881 to 1889, inclusive, the number of tons of coal produced per fatal accident was 142,287. In the following decade, the number of tons dropped to 141,915, and from 1900 to 1909, during which time mine rules were more strictly enforced and many safety devices and danger signs were introduced, the number increased to 153,717. The average for the three years 1910, 1911 and 1912, was 160,591. The figures are from the latest annual report of the Pennsylvania Department of Mines.

Basing the estimate on thousands of employees, the death rate from 1881 to 1889 inclusive was 4.45; from 1890 to 1899 inclusive was 4.27; from 1900 to 1909 inclusive was 4.24. The average for the first three years of this decade was 4.32.

Mine disasters are so dramatic and terrible that they are given prominent display in the newspapers of all countries, and this has given rise to the erroneous impression that mining is the most dangerous of all occupations. A recent study of the casualty record of the coal mines, railroads and steel mills in this country, however, revealed that mining was the least dangerous occupation of the three. In 1911, the latest year for which there are official figures in the three industries, 31,334 of the 729,279 coal miners were injured; 126,039 of the 1,669,809 railroad employees; and 35,764 of the 158,604 steel employees. A reduction of these figures to a common basis brings out the fact that for each thousand men employed, 225.48 were hurt in the steel mills, 75.48 on the railroads, and 42.96 in the coal mines.

Editorials

Washouts, Sandbars and Distortions

The first impulse on finding that coal is absent where there is no evidence of faulting is to assume that it was either never deposited or that it was removed by erosion. Some of the coal thinnings and removals result, however, from the effect of readjustment of measures under side pressures. When the rock structure of the earth was subjected to strain, the yielding coal, clays and shales suffered more than the harder strata. This is clearly brought out in Boulton's "Geology of the Coal Measures," forming the first part of the Practical Coal-Mining series, recently published by the Gresham Publishing Company.

Thus in the Somersetshire coal field of England are several "wants," which were believed for a long time to be "washouts" contemporaneous with, or immediately sequent on, the deposition of the seam. But it was found by Mr. Steart that the coal had been replaced not by the hard sandstone of the roof, but by the soft black shale of the floor, that the areas believed to be eroded were too irregular to be the streams of ancient rivers, and that the "wants" occurred most frequently in the vicinity of badly faulted measures and not infrequently paralleled them roughly. Furthermore, in some places the coal became much thicker and consisted of layer upon layer of coal piled on one another. What is more, the thinnings were not common to one bed alone, but were found superposed in several of the beds in any locality.

It is true that erosion by relieving pressure may have produced a flow in the coal measures, especially in newly deposited beds, and that, consequently, thickness exceeding the normal may be due to the exuding of embryotic coal from lightly pressed to unpressed areas. It is also true that a depression, such as causes erosion, may be produced repeatedly in the same place during the deposition of different coal beds, but while these are possible and often probable explanations, the evidences seem sometimes rather to point to the causes being more recent and the action more violent.

The amount of displacement of the coal in the seam in many cases has a relation to the softness of the material on which the coal rests. Where the floor is a hard fireclay, it has failed to transfer so severe a strain to the coal. Further evidences of the dynamic rather than the hydraulic origin of these "wants" are that the appearance of the carbonaceous masses is so smoothed and polished as to suggest extrusion, the striations of the roof are at right angles to the main axis of the overfolds of the district, and in some cases where the thick coal appears, a thin layer of cannel occurs on the top of each layer of coal, as if the quintessence of the bed has been squeezed out under pressure.

While in English coal measures the pressures have been more severe than in much of the bituminous area of this country, it would be well in every case to be cautious in assuming that "wants" are erosions or sandbars wherever they appear. Of course, some will say that it is of no importance what are the causes, but where one is in doubt as to the best way in which to deal with disturbed ground if the cause is rightly determined, the extent of the trouble and its general nature will be better evalued.

The Folly of Defense

There are few persons more unfortunate than a defendant. Seldom does he succeed in being triumphantly vindicated. He often says that he is, and his closest friends confirm him in the statement, however, with less assurance than he himself usually shows; but as a matter of fact, he is besmirched even if there is barely a scintilla of evidence.

And the logic is, don't be a defendant, be a prosecutor. Fail you may, but you are unhurt by that fact for the sting of accusation is still left to plague the defendant. However, it is a poor maxim to advocate this scourging of opponents unless you are sure of the essential justice of your ground and can let loose with a clear conscience.

The leading defendant, the perpetual defendant, is the coal business. The folly of defense has been perpetually evident in the history of colliery ownership. A mean and puny part is that occupied by the industry which, charged with many shortcomings, meets some, extenuates others and admits a few. We all have faults and so the part of the defendant fits us ill; we all should be above suspicion, so contumelious reproach makes cowards of us all.

The successful people are those who attack, who deliver a blow on the ground of their opponent. The wildcatters and smaller oil men of Oklahoma recently fiercely denounced three big oil companies operating in that state. They accused them of all kinds of discriminations, combinations and duress, and, as a result, the public of Oklahoma got to think these wildcatters and smaller oil men needed assistance and enabled them to form a trust of the most law-breaking description.

Thus also the farmers of Missouri attacked the Harvester Trust. The court ruled, to quote the *Independent,* that the slight increase in prices had been preceded by a greater increase in the prices of labor and material, that the increased cost of construction and the improvement in the machines more than offset the increased price, that there had been a reduction in the cost of repair material, that "farmers generally" had "profited by" the companies' competition with other manufacturers, that independent manufacturers "had not suffered by reason of the combination," that many retailers had testified that the company used no unfair methods in the treatment of competitors, and that "on the whole the evidence shows that the company has not used its power to oppress or injure the farmers, who are its customers."

Nevertheless, George W. Perkins and Thomas D. Jones are both besmirched by their connection with this trust. One is in danger of being thrown out of his party and friendship with him has been regarded as casting a stigma

on his most prominent political supporter. The other is subjected to congressional abuse and questioning and debarred from service on the Federal Reserve Board. But on the other hand, the farmers who yelled so lustily at the combination of others, are about to get a bill passed through Congress, permitting them to combine to their hearts' content.

These instances we might continue to multiply but, without further parley, the work cut out for coal men is very clear. Be aggressive. Do not say our profits are too small, we are *not* coal barons; let us point rather to the fortunes of those who oppose and oppress us. No coal man ever made such profits in mining as are made by makers of breakfast foods, soaps, automobiles and a hundred other articles. Let us then rather clamor that such men be restrained and convince the citizen that while wasting his energy in chasing a dog with a can tied to its tail, he is overlooking the slick person who, aiding in the chase, is filching that worthy gentleman's purse.

In the age of feudalism, the seller was little better than a serf; the buyer was a lord. So we have learned as a race to be humble as sellers and lordly as buyers, forgetting that rightly he who buys has as many obligations as the seller. And, by the way, this applies as much to the sale of labor as of any other community, though we are slow to believe it.

The buyer believes he, the lord, has a right to receive coal from the serf whenever he is graciously pleased to buy it. He would have the mines seized if he cannot get the coal he needs. But, viewing the seller as equal to the buyer, why have not the manufacturing establishments of all kinds been seized or at least coerced by government to go on buying coal during the present lull in business? If the seller must saddle and go to market, must not the buyer be there to meet him? If for failure to ship coal, the freedom of the coal operator and miner is to be removed, why not subject the manufacturer to an equal duress when he has a strike and ceases to buy? What are the profits of the manufacturers to the coal man, for none of them has ever cared if the latter made a living?

Only by rebates, promotions, real-estate deals and leases has money been made in the coal business in the past; almost as much has been lost as gained in real coal extraction. What rascality, keenness and chicanery the business has known has almost all come from bankers and lawyers and not from the real operating and developing heads. But let us not enter any defense, seeing we have so clear a line of attack? Let us bring our suit against the exploiters of the public and pursue it without any fear of having to enter a barren *nolle prosequi.*

Co-operative Mining in Illinois

In the recent activity in coöperative mining in the Illinois coal field, a unique condition has been developed replete with interesting possibilities. The move savors strongly of socialism, and indeed there are many rumors current to the effect that radical socialists are the controlling factors in the companies involved.

The innovation is unique in, that, for the first time, we find both capital and labor lined up on the same side. In this modern age of continual and, at times, almost bitter strife between these principals, the situation is indeed unusual, which unites them in a common cause; but such is clearly the case in this instance.

By working on a fluctuating scale, varying according to market conditions, and frequently ranging well below union wages, the coöperatives are violating the most sacred principle of organized labor. On the other hand, the independent, legitimate operators of Illinois are the most acute sufferers. Uncontrolled by the customary principles of economies, which establish an approximately uniform cost basis in all lines of industrial endeavor, the mutual operators continue dumping their product on the market irrespective of the prices received.

While the tonnage involved is relatively small, as compared with the output of the entire state, it is obvious that business along these lines must inevitably demoralize a slow or even normal market. Certainly, the regular companies, compelled to meet a fixed cost of production, cannot compete with such uneconomic methods.

The legitimate operators, having signed contracts with the Illinois Mine Workers adopting a fixed rate of wages, naturally feel justified in holding the union officials responsible for this condition. Indeed, the path of the labor officials is strewn with many difficulties. With the operators assailing them on the one hand for permitting gross violation of the wage scale, and the coöperative miners on the other hand giving up their union charters rather than abandon their mines, the situation is steadily becoming more tense. The issue cannot be long delayed and may ultimately be more far-reaching in its effects on the coal industry than now seems apparent.

Perhaps one of the most distressing features of the situation is the strong appeal for sympathy one must feel for certain cases of the coöperatives. For instance, let us consider the case of some of the older miners, men on the final decline, who are unable to longer stand the rapid pace set by younger, more energetic and ambitious men; coöperation of such men for their mutual protection seems eminently just.

Again, we have a case of a mining community threatened with abandonment. It frequently happens that the more thrifty men in such locations have invested their earnings for long periods in small homes, the intrinsic value of which is directly dependent upon the continuation of mining operations. Will either capital or labor attempt to restrain such men from protecting their interests at whatever sacrifice they see fit to make?

Rules for Mining Plants

Rules, general and special, have been written and posted on our tipples on behalf of men, many of whom cannot read. But rules for mechanics and others who can read and whose duties keep them near where the rules may be posted, we too frequently omit. We need rules to prevent fires, to promote safety, efficiency and economy. They do not need to be stringently written. The average mechanic is a proud man or he would follow a line of work demanding less originality and enterprise. His pride is his asset; do not deprive him of it, but give him rules so couched that they will appeal not to his fears, but to his loyalty and intelligence.

One of the results of the "safety" campaign carried on by the Reading Coal & Iron Co. the past year has been the adoption of broad leather washers on the handdrills of the miners. This precaution has saved many a crushed finger.

Extracts from a Superintendent's Diary

About the most ludicrous, and yet withal the most pathetic sight imaginable, is presented when one encounters unexpectedly one of our typical miners "dressed up."

Today while in the city I chanced upon two who came within the full meaning of the phrase—Tony Williams and Ray Ivy.

Both were bedecked with high, generously starched collars, fancy cravats and waistcoats (after a man has made a study of tailor books and magazine clothing ads. these days, he will assure you that vests and waistcoats are quite different garments), fancy socks, patent leather shoes, creased pants, etc.

Both of them are married men with families, and why they should feel called upon to prepare themselves for dress parade in the city is not evident. Possibly the gaudy posters furnished by the tailoring companies, displayed to such excellent advantage by our commissary manager, could not be resisted, or perhaps a desire to get even with the wife for buying a new dress on credit may have furnished the motive. Be that as it may, every time I happened out on Main St., Tony and Ray were very much in evidence.

Occasionally I overheard passersby discuss them, and everyone who noticed them turned about and observed them critically.

I happen to know that Tony took Bob Jones, our timekeeper, to town with him when he selected his tie, vest and socks, after purchasing a suit from the tailoring company that handles the orders taken by our commissary. (It's easy to believe that commissary clerks might not be eminently fitted to take suit measurements; at least it would be easy to believe that after having gazed upon Tony arrayed in all of his glory.)

Bob is the Beau Brummel of our community, and his taste in dress is beyond question, but it is possible that he decided that our camp is displaying too little originality in the gentle art of choosing raiment and so decided to lead Tony into new pastures. At any rate, judged by conventional standards, Tony was curious looking.

It is possible that I am doing Bob an injustice, and instead of trying to put one over on Tony he had planned to make his tie, socks and waistcoast so conspicuous that Tony's bowed legs, gnarled back and tremendous hands should escape notice. In this, however, giving him the benefit of the doubt, he failed singularly, for poor Tony was followed by a crowd of jeering boys throughout most of the day, and their remarks had reference mostly to "the shape of that guy with the cuffs on his pants."

Ray Ivy early in the day decided that his neck was too large for "biled" collars, so he partially disrobed at a fruit stand and presented the offending collar and his cravat to a blind beggar. Later on, his patent leathers becoming unendurable, he stopped in a second-hand store and swapped them for a pair of boots. Now pants with cuffs were designed by tailors who never heard of boots; Ray gave the cuffs to a messenger boy who was trying to mend a leaky bicycle tire with a piece of handkerchief.

Both Tony and Ray are active members of our first-aid team. While we were en route home tonight they got into a heated discussion with some of their companions about the most suitable topic for next week's first-aid discussion. Bob Jones, sitting over in one corner of the coach, apparently trying to sleep, rose up about this time and remarked that he had never heard any of them make a suggestion as to the first-aid best adapted for a fellow being choked by a necktie. Forthwith, Tony jerked off the offending member of his garb, amid the jeers of the balance of his companions.

Recent Legal Decisions

Responsibility for Failure to Make Repairs—A coal mining company is liable for injury to a miner caused by a defect which it negligently failed to repair after the general superintendent had had knowledge of its existence for several days. (Alabama Supreme Court, Sloss-Sheffield Steel & Iron Co. vs. Dobbs, 65 "Southern Reporter," 360.)

Miner's Choice between Safe and Unsafe Ways.—When a coal miner has a safe means of exit through one entry, he assumes the risk of being injured in passing through an entry which he knows to be unsafe. (Kentucky Court of Appeals, Elliott vs. Greenville Coal Co., 167 "Southwestern Reporter," 424.)

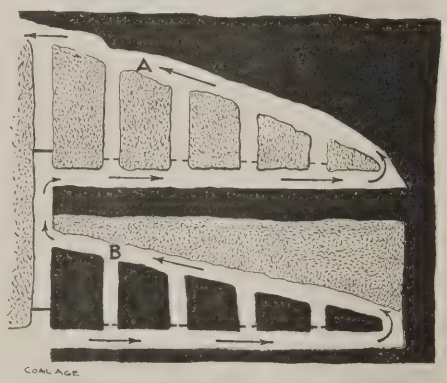
Right to Recover Price Paid for Machines—Under the following state of facts, the owners of a mine were held not to be entitled to recover money paid for machines intended to be used in mining and loading coal: It was agreed between the parties that the machines were to be similar to a machine made by the manufacturer for another mine owner and then in use, with such changes as might be decided upon by the manufacturer and the buying mine owners' manager, to whom the specifications for the machines were to be submitted. The machines were to be furnished at cost, and put in place, "in order to demonstrate their abilities." The mine owners sued to recover the price of the machines, on the ground that they proved to be useless, and that the manufacturer impliedly warranted that they would do the work for which they were ordered. The manufacturer defended the suit on the ground that the buyers' manager had examined an experimental machine made by the manufacturer, and believed that a similar machine could be used in the mine; that during the construction of the machines the manager required a change in power from electricity to compressed air, in order that the machines could be used in gaseous mines; and that this change greatly increased the cost of manufacture—to an amount in excess of the price received by the manufacturer. This defense was sustained by the court, on the ground that the agreement was joint and experimental. (Pennsylvania Supreme Court, Rainey vs. Morgan, 88 "Atlantic Reporter," 798.)

Railway Company's Liability for Refusing to Furnish Cars—A coal operator can recover from a railway company damages resulting from the latter's discrimination against him in favor of other coal shippers, in refusing to supply cars, if the company had an adequate supply of cars on its tracks. (Pennsylvania Supreme Court, Sonman Shaft Coal Co. vs. Pennsylvania Railroad Co., 88 "Atlantic Reporter," 746.) The fact that a coal company instituted proceedings before the Interstate Commerce Commission to recover reparation for discrimination in distributing cars did not preclude subsequent suit against the same company to recover damages on account of discrimination relating solely to intrastate commerce. (Pennsylvania Supreme Court, Clark Bros. Coal Mining Co. vs. Pennsylvania Railroad Co., 88 "Atlantic Reporter," 754.) A railway company which discriminated against a coal shipper by counting cars owned by him in the number of cars allotted to him, whereas that was not done in the case of other shippers, cannot avoid liability for damages resulting to him, by showing that the Interstate Commerce Commission afterwards adopted an order requiring privately owned cars to be taken into consideration in apportioning equipment among shippers. (Pennsylvania Supreme Court, Stineman Coal Mining Co. vs. Pennsylvania Railroad Co., 88 "Atlantic Reporter," 761.)

Coal Used in Operation by Lessee Not Subject to Royalties—"Under the custom prevailing in the anthracite region, coal used by a lessee in the operation of the mine is not subject to royalties," in the absence of provision in the lease to the contrary. (Pennsylvania Supreme Court, Trustee of Proprietors of Kingston vs. Lehigh Valley Coal Co., 88 "Atlantic Reporter," 769.)

Discussion By Readers

Working Coal Seam with Heavy Parting



Letter No. 7—Replying to the inquiry of Fred Morck, COAL AGE, June 13, p. 981, I would suggest that he use a coal cutter capable of mining at any desired height above the floor, similar to the Jeffrey-O'Toole. The cut should be made in the base of the parting if the material will cut; if not, in the coal immediately under the parting. After completing the cut, take out the parting and load or gob it before disturbing the coal, so as to avoid loading dirty coal.

The disposition of the material of the parting depends largely on the plan of mining and whether this is a shaft or a drift proposition. If roof conditions are such as to make it possible to draw the pillars, the parting material should be removed from the mine.

W. D. HANLON,
Consulting Engineer, Railways-Mines.
Cleveland, Ohio.

Letter No. 8—Some years ago, an old mining teacher used to tell us boys, who attended his class, that the best way to reason was to use a concrete example to prove our argument. I agree that market conditions are important factors in working a coal seam with a heavy parting. However, from my observations, the thickness of the parting is the most important factor to be considered in this case. I propose to use a concrete example.

In the State of Alabama we have a seam of coal known as the "Mary-Lee" seam. The height of the seam varies from 5 ft. 5 in. to 9 ft. 5 in. The seam has a parting rock known as the "middleman," which varies in thickness from 12 to 24 in. The lower bench of this seam, or the coal under the middleman is usually, about 3 ft. in thickness. The method of extracting the coal is a simple one; the lower bench is taken out to a depth of about 5 ft., after which the parting-rock and the seam of coal above it are shot down. The rock is separated readily from the coal, the latter being loaded out first, and the rock disposed of afterward. The coal is all mined by pick on the room-and-pillar system, the rooms being driven double with a wide breast. The price paid for mining varies from 42½ to 52½c. per ton, the difference in price being due to the varying height of the coal in the lower bench. This seam of coal is mined extensively in Alabama, which indicates that such coal seams with heavy partings can be worked at a profit.

WORKING TWO SEAMS AS ONE

Formerly I had some experience in a seam of coal where the parting-rock was 5 ft. in thickness. The proposition was practically one of working two seams through a single set of openings or roads. The lower seam measured 3 ft., while the upper seam was 3 ft. 6 in., in thickness.

The accompanying sketch may assist, to some extent, in explaining the method of working these two seams as one. As the main roads are advanced, the work of taking out the coal is commenced in the lower seam. This coal is taken out under the parting-rock, on the longwall advancing system, as shown in the section marked *A*. This work is kept several yards in advance of the work in the upper seam, the distance being determined by the settlement of the overlying strata on the waste, which is packed solid.

The work of taking out the coal in the upper seam is performed in panels, on the retreating system of longwall. This is shown in the section marked *B*. A new panel is opened out by ripping the rock and taking down the upper coal, at a point a few yards behind the longwall face in the lower seam. The coal in the upper seam is then worked back on the retreating system until the entire panel is taken out.

By this means, the handling of the rock is entirely eliminated. The method has the further advantage that, owing to the settlement of the parting-rock or middleman, away from the coal in the upper seam, the latter requires no mining and is easily wedged down. The system was very successful in the production of cheap coal. I hope this interesting discussion will continue.

Problems in Rescue Apparatus

Letter No. 1—I have read with interest the inquiry of W. H. Moore, COAL AGE, June 27, p. 1062. I fully agree with your statement that, "It is well nigh impossible to give exactly the reactions that take place between the hydrocarbons in the building up of the tissues of the body through the supply of oxygen to the lungs." In this connection, the following quotation from a first-aid book will be of interest:

> This necessary purification of the blood is accomplished by the process of respiration, which may be defined as the function by which oxygen is absorbed into the blood and carbonic acid given off. To understand the necessity for the respiration process, it must be remembered that the leading feature of the chemical changes that go on in a living body is of the nature of a burning up or a combustion of the tissues, as shown by the production of bodily heat. To allow for this combustion going on and continuing, a certain amount of oxygen is absolutely required, just as an ordinary fire could not burn if no air or, in other words, no oxygen reached it.
>
> But it is also a well established fact that there can be no combustion without the formation of waste products, one of the chief being carbonic acid. The tissues of the body are no exception to this latter law, and they freely give off car-

bonic acid as one of their waste products. Proof of this can be furnished by examining the blood in an artery going to, and in a vein coming from, any part of the body. From a pint of each of these varieties of blood, about half a pint of gas could be obtained by means of the air pump; but there would be a great difference in the composition of the respective gases. That obtained from the arterial blood would be made up of some nitrogen, a good deal of oxygen and a considerable quantity of carbonic acid; while that gotten from the venous blood would be composed of some nitrogen, but of only half the amount of oxygen and a much larger amount of carbonic acid. From this it is quite apparent that, as the result of nourishing the tissues, the blood has lost oxygen and gained carbonic acid. In fact, it is the presence of this large amount of the latter gas that constitutes the chief difference between arterial and venous blood and accounts for the difference of color between the two.

There is then going on in every part of the body a conversion of the red arterial into dark venous blood, owing to the tissues using up or breathing, as it were, the oxygen of the blood and pouring back into it the waste products of combustion in the form of carbonic acid and other substances. As long as this interchange of gases goes on regularly, everything works smoothly, but if it is in any way interrupted, and the blood that comes to the tissues contains no oxygen, then combustion ceases, the nutritive changes stop, there is a complete slowing if not an entire cessation of the machinery of the body, and death results.

I am inclined to believe that the 70 liters of oxygen, which Mr. Moore says are unaccounted for, must play an important part in sustaining life while wearing an apparatus, let it be the Fleuss, Draeger or Meco. I am not prepared to say what becomes of it, but I believe that the nitrogen, also, has its duty to perform just the same. It is true that the three types of apparatus named are expected to supply the wearer with two liters of oxygen per minute, which is $2 \times 61 = 122$ cu.in. According to tests made, a man wearing an apparatus and walking 4 miles per hour, requires 50 liters of air per minute, or $50 \times 61 = 3050$ cu.in. of air. Then, if we breathe at the rate of from 15 to 20, say 17 times per minute, we inhale $3050 \div 17 =$ say 179 cu.in. at each respiration.

Again, quoting from the first-aid book:

The full capacity of the lungs is 330 cu.in., in adults. In an ordinary respiration, from 20 to 30 cu.in. of air enters the lungs. This is called "tidal air"; and 200 cu.in. remains in the lungs after ordinary expiration. This is called "stationary air." In deep expiration, 100 cu.in. of air can be expelled from the lungs, and this is called "supplemental air." The remaining 100 cu.in. is the "residual air," and this cannot be expelled. By taking a deep inspiration, 100 cu.in. extra can be drawn into the lungs, making the full capacity of 300 cu.in. This is called "complemental air."

The above shows that 2 liters, or 122 cu.in. per min., or a little less than 8 cu.in. of oxygen per respiration, is supplied to the wearer of the apparatus while engaged in ordinary work; but apparatus wearers doing strenuous work require 50 liters of air per minute, or 179 cu.in. of air at each respiration. If they forget to turn on the bypass valve to replenish the volume of air, they at once experience that inability to draw a deep breath, begin to gasp and, in a few seconds, either fall or require assistance from others to enable them to stand and walk. This occurrence proves that they are not getting the necessary amount of air from the 8 cu.in. furnished by the 2 liters per minute. The purest air that we get is what Nature provides, which consists of about $^1/_5$ oxygen and $^4/_5$ nitrogen. This is why it is necessary to fill up the breathing bag with the outside atmosphere before turning on the oxygen in the apparatus. This provides the proper supply and mixture to start. If the breathing bag is too much distended release some of the exhaled air from the bag, by means of the release valve, until you breathe comfortably. This will also test the tightness of the apparatus and show that the release valve is in working order.

In reference to the moisture being absorbed by the caustic potash or caustic soda, I will say not all of it is absorbed, and that remaining I consider a dangerous element. This may be where some of the 70 liters of oxygen goes. I understand that water will hold in solution its own volume of CO_2, while nitrogen has no affinity or very little for either gas or water, serving only as a diluent. Be this as it may, some men yield more moisture than others. With the Draeger apparatus, I have found the saliva cup full and running over, besides enough water in the tube in front of the injector to interfere with the regular supply of air. This feature may be overcome by removing the saliva trap to the bottom of the regenerator, as is done on the improved or positive-pressure type. This trouble is also found both in the Meco or Westfalia, and Fleuss or "Proto." The caustic soda becomes nearly a liquid, after the apparatus has been worn an hour or more, and this is a source of great danger. I would like some advice as to the best method of overcoming this collection of moisture.

Supt., Mine Rescue Station.
Springfield, Ill.

Graft in Labor Unions

I have read with great care and interest every article bearing on the working conditions of the present industrial movement, which seems to be rife in almost every coal-mining state at the present time. I have nothing to say against miners' organizations; I believe they can be made to prove helpful to every honest workman, if conducted properly by the officers in charge. This, however, is far from being the case.

I wish to relate a little of my past experience in the Westmoreland County strike of 1910-11. During that strike, I served as committeeman in the Ligonier Valley, Wilpen, Penn., Local No. 729, U. M. W. of A. This was the only local on the whole branch north of Ligonier. The companies who were affected by this strike are the following: Ligonier Coal Co., Peters; Columbia Coal & Coke Co., Old Colony; Marietta-Connellsville Coke Co., Marietta; Ligonier Diamond Coal & Coke Co., Seger Plains; and the Fort Palmer Coal & Coke Co., Ligonier.

Of the miners working on this branch, 95 per cent. are foreigners, and of these, only about 3 per cent. can read and speak English. On May 3, 1910, all the miners working on the branch were called out by strike agitators from Latrobe, who promised to see that the union was established; that the men would gain everything they wanted; and that the strike would not last long. They found the foreigners ready listeners; and, at that meeting, officers were duly elected.

The chairman of the Relief Committee knew nothing about the coal and coke business; but he knew how to keep his hands in the treasury and to get drunk. As was learned later, the graft in one day was from $50 to $70. After the reading of the treasurer's report at one meeting I asked for an explanation of how the money in the treasury was obtained. The chairman explained to me that the National Organization sends to every local $2.50 for each striker, $1 for his wife and 50c. for each

child. He explained, we pay three-fifths of this amount for relief and retain two-fifths for our own use; and added, "You know they are all dummies and know nothing of the transaction. You would be crazy not to grease your axle when you handle oil."

Investigation showed that the pages were torn from the ledger and the minute book; and that the treasurer's book showed only the full amounts. We succeeded in having new officers elected and I was appointed distributer of the relief funds. The following week the new officers went to Greensburg to have the books corrected at headquarters. At that time, it was found that the chairman had extracted from the treasury $600.75. I asked what could be done, and the reply was, "If he gave no bond, you can do nothing with him." An examination of the check book showed that one check for $8 endorsed by an organizer, was drawn in favor of another party, whom it never reached.

As I have pointed out, at another time, if coal companies would interest themselves to see that the locals in their vicinities are properly conducted; and that trade conditions are more fully explained and understood, there would be more coöperation on the part of the men and less labor troubles.

JOHN MAJER.

Listie, Penn.

A Longwall Proposition

Letter No. 6—Referring to the recent discussion of the longwall proposition, presented by Mr. Hartsuff, COAL AGE, June 6, p. 944, my experience of 30 years in longwall work in Scotland leads me to suggest the use of the "conveyor system" in this case. The advantage of that system would be that it would be possible to carry a much greater length of coal face and thus avoid the expense of maintaining so large a number of roads leading to the face as are necessary in the common longwall system.

The main roads, only, would require heavy brushing, and if the packwalls, say 20 ft. wide, are well built on each side of the road, these would probably be good for all time. The slate roof overlying the seam, and beneath the hard "sulphur binder," would probably furnish sufficient material for building the required roadpacks.

The principal features to be considered in the adoption of the longwall method of mining are the thickness of the seam, depth of overburden, character of top and bottom, and whether the work can be advanced continuously. The main point, in this system of working, is to take out all the coal anl allow the top to settle down solid on the packwalls and waste.

JOHN SHEPHERD.

Glencoe, Ohio.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

EVOLUTION

The word "evolution" means an unrolling or unfolding. The process is the reverse of involution.

Involution is finding the product of equal factors.

Evolution is finding the equal factors of a given number. In the latter case (evolution), the given number is a certain power of another number called the **"root."**

Roots of Numbers—The number of equal factors required is the **"index"** of the root.

The extraction of a root is indicated by the character $\surd$ called the **"radical,"** written just before the given number. The index, denoting the root required, is a small figure written above and before the radical. For example, $^2\surd$, $^3\surd$, $^4\surd$ written before a number, indicate, respectively, that the second, third or fourth root of the number is required.

As in involution, the first root of a number would be the number itself; while the second root is commonly called the **"square root"** and the third the **"cube root"** of the number. When the square root is desired, it is indicated by the radical sign alone, the index figure 2 being omitted. Thus, $\surd 4$ indicates the second or square root of 4 is to be extracted; $^3\surd 8$ indicates the cube root of 8; $^5\surd 9$, the fifth root of 9; etc., etc.

It is customary to write a bar over the number whose root is to be extracted; thus, $\surd 144$ indicates that the square root of 144 is to be extracted.

To Find a Root by Trial—The root of a number can always be found, to any desired degree of approximation, by the successive multiplication of trial factors.

Example—Find, by trial, the following roots: (a) $\surd 81$; (b) $^3\surd 216$.

Solution—(a) By trial, $7 \times 7 = 49$, low;
$8 \times 8 = 64$, low;
$9 \times 9 = 81$. Hence, $\surd 81 = 9$.

(b) By trial, $5 \times 5 \times 5 = 125$, low;
$7 \times 7 \times 7 = 343$, high;
$6 \times 6 \times 6 = 216$. Hence, $^3\surd 216 = 6$.

In evolution, it is important to note the following observations:

1. Beginning at the units place, divide the number into periods of as many figures each as there are units in the index. In a decimal, the division begins at the decimal point, the periods of the integer being counted to the left and those of the decimal to the right of this point. The left-hand period may contain fewer figures than the index denotes; but the right-hand decimal period must always be completed, by adding ciphers, if necessry.

2. The root of a number will always contain as many figures as there are periods in the number, and the number of decimal figures of the root will be equal to the number of decimal periods of the number.

The Coal Age Pocket Book

Example—Find by trial the cube root of 35,208.25.

Solution— $^3\surd 35,208.25 = {}^3\surd 35,208.250$

Observe, each period of the number represents a figure of the root. Therefore, find the greatest cube contained in the first period on the left and its root will be the first figure of the required root; thus

$3 \times 3 \times 3 = 27$, low; and $4 \times 4 \times 4 = 64$, high.

Then the first figure of the root is 3. In the same manner, find the second figure, by considering the first two periods of the number and ascertaining the greatest cube contained therein. The root will evidently be a number between 30 and 40. Thus, by trial,

$33 \times 33 \times 33 = 35,937$, high;
$32 \times 32 \times 32 = 32,768$, low;

The first two figures of the root are therefore 32 and these form the integer of the root. In the same manner to find the third figure which is the first decimal figure of the root, consider the three periods of the number and proceed thus,

$32.8 \times 32.8 \times 32.8 = 35,287.552$, high;
$32.77 \times 32.77 \times 32.77 = 35,190.814$, low;
$32.78 \times 32.78 \times 32.78 = 35,223.040$, high.

Therefore, $^3\surd 35,208.25 = 32.77+$, which is correct to two decimal figures.

Square Root, Direct Method—

Rule—Beginning at units place, divide the number into periods of two figures each. Observe the greatest perfect square contained in the left-hand period, and write its root as the first figure of the required root. Subtract the square of this figure from the first period, and to the remainder annex the second period, for a dividend.

Divide this dividend exclusive of the last figure, by twice the root just found. Write the quotient for the second figure of the root, and annex the same figure to the trial divisor. Multiply the divisor so increased by the said second figure of the root and subtract the product from the last dividend. To this remainder annex the third period for a new dividend.

Again, double the root for a trial divisor and proceed as before till all the periods are brought down. If there is still a remainder, the process may be continued by writing a decimal point in the root and annexing two ciphers to the last remainder. The work may thus be carried to any degree of approximation desired.

Example—(a) $\surd 274,576$ (b) $\surd 1.4161$

Solution—

```
(a)    27 45 76(524          (b)     1.41 61(1.19
       25                             1
      ------                         ------
 10 2) 2 45                    2 1)   41
       2 04                           21
      ------                         ------

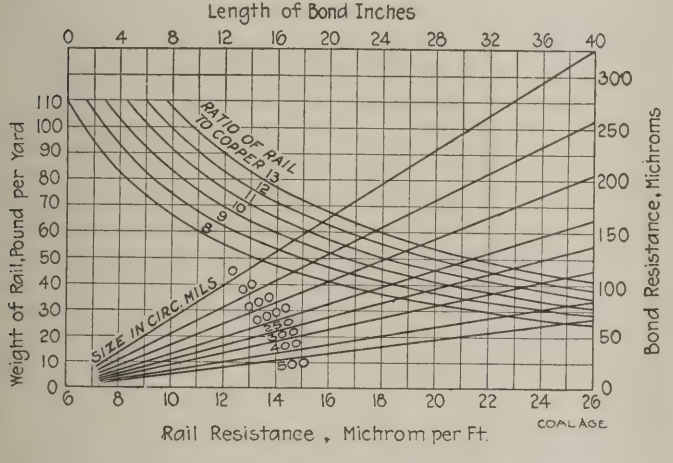
       41 76                          20 61
```

Inquiries of General Interest

Electrical-Power Transmission

After a considerable discussion of the following question, which has given rise to different opinions in reference to the correct answer, it has been agreed by the parties interested to submit the question to COAL AGE for solution, and to be governed by its decision. The question is as follows:



Ques.—A 50-hp. blowing fan, located one-half mile from the power house, is to be driven by a 250-volt motor. The generator at the power station delivers 275 volts. (a) What size of wire should be used to connect the motor and generator? (b) At 20c. per lb., what will be the cost of T. B. W. P. copper wire, for this job?

JOHN J. CRANE.

Connerton, Penn.

The electric power required to drive a 50-hp. fan is $50 \times 746 = 37{,}300$ watts. The current required to operate a 250-volt motor so as to supply this power is $37{,}300 \div 250 =$ say 150 amp. Since the generator at the station delivers 275 volts, and the motor requires only 250, there is a permissible line drop of $275 - 250 = 25$ volts.

The accompanying combined diagrams, adapted from the publications of the Ohio Brass Co., furnish a convenient method of determining the electrical resistances of steel rails of different weights per yard and of compressed-terminal bonds of different size and length. The lines curving downward from left to right are the resistance curves for different "rail-to-copper ratios."

RESISTANCE DIAGRAM FOR BONDED RAILS

In using this diagram to find the resistance per foot in microhms for any given weight of rail, follow the horizontal line corresponding to the given weight per yard of rail shown by the scale on the left of the diagram, until this line intersects the curved line of the proper rail-to-copper ratio. From this intersection, follow the vertical line downward to the scale at the bottom of the diagram, which gives the microhms of resistance per foot of rail. For example, assuming a 40-lb. rail having a rail-to-copper ratio of 12 : 1, the resistance per foot of rail, as found by the diagram, is 25 microhms, or 0.000025 ohm. If the rails are 30 ft. long, the resistance of each rail is $30 \times 0.000025 = 0.00075$ ohm.

Now, assuming a 24-in., 4-0 bond, follow the vertical line marked 24 on the scale at the top of the diagram downward to its intersection with the diagonal line marked 0000, and from this intersection follow the horizontal line to the scale on the right, which will give the required resistance of the bond in microhms. In the present case, the resistance of the 24-in., 4-0 bond is 100 microhms, or 0.0001 ohm.

Adding this resistance for a single bond to that for a single 30-ft. rail, the total resistance for a bonded rail is $0.00075 + 0.0001 = 0.00085$ ohm. The number of rails in ½ mile is $2640 \div 30 = 88$. The bonded rail resistance, in this distance, is then $88 \times 0.00085 = 0.0748$ ohm. This is the resistance for a single line of rail. The track resistance (two rails) for the same distance is one-half that for a single rail, or 0.0374 ohm.

Now, multiplying this resistance by the current (150 amp.), the voltage or pressure absorbed by the rails of the track, on the return end of the circuit, is

$$E = CR = 150 \times 0.0374 = 5.61 \text{ volts.}$$

Then, allowing for possible loss of pressure through imperfect connections at the rail joints, and assuming, say six volts on the return end of the circuit, the permissible drop of pressure in the trolley line is $25 - 6 = 19$ volts.

Finally, the size of trolley wire required to transmit a current of 150 amp., with a line-drop of 19 volts, is then calculated as follows:

$$\text{Circ. mils} = \frac{21.6 \times 2640 \times 150}{19} = \text{say } 450{,}200$$

The weight of a triple-braid, insulated copper wire of this capacity, as taken from manufacturers' tables, is 1724 lb. per 1000 ft., or 1.724 lb. per ft. At 20c. per lb., one-half mile of this trolley wire will cost $2640 \times 1.724 \times 0.20 = \$910.27$.

Wind Pressure

What is the best method of estimating the pressure exerted on a flat surface by a wind traveling at a certain velocity, say 60 miles per hour?

ENGINEER.

Denver, Colo.

From experiments performed by the U. S. Weather Bureau, for the purpose of determining, if possible, the exact relation existing between the velocity and pressure of straight, surface winds, it was found that this relation is best expressed by the formula

$$p = 0.004 \frac{B}{30} v^2$$

Thus, for a velocity of $v = 60$ mi. per hr., when the barometric pressure is $B =$ say 28 in., the pressure of a straight wind, normal to a flat surface, is

$$p = 0.004 \frac{28}{30} 60^2 = 13.44 \text{ lb. per sq.ft.}$$

Examination Questions

Miscellaneous Questions

(*Answered by Request*)

Ques.—In case of an explosion, at a shaft mine in your district, where many workmen are yet in the mine, and you were the first person on the ground after the accident, how would you organize and conduct the work of rescue?

Ans.—Until someone higher in authority underground than yourself arrives, call for volunteers; have the foremen and all firebosses notified at once; note the effect of the explosion by the indications observable at the upcast or downcast shafts, and inspect hurriedly the ventilating apparatus, which, if damaged, must be repaired as quickly as possible; arrange for the speedy equipment of rescuers with safety lamps, tools, supplies, etc.; and, having instructed the regular rescue and first-aid corps to proceed, if possible, into the mine by the most accessible opening, follow this with the organization of other rescuers chosen from among the most competent and experienced of the volunteers.

The entrance of the mine will depend wholly upon conditions, but, in general, must be effected through the intake openings, following the intake air current and making such hasty repairs as are possible and necessary to conduct the air current into the mine. The force of volunteers should be divided into two gangs, the more experienced men advancing to make the necessary exploration and repairs, while the others are employed to furnish the first party with any needed supplies and perform such other services as are desired. The mine should be explored thus in sections, taking special precaution to extinguish any fires that may exist after the explosion and to properly control the ventilating current until each section is reported safe.

Ques.—What are the advantages and disadvantages of the different kinds of mining machines, with respect to health, safety and economy?

Ans.—There are two general types of mining (coal-cutting) machines; namely, those driven by compressed air and electricity, respectively. Compressed-air machines have the advantage of furnishing a certain amount of fresh air at the working face, through the exhaust of the machines. They have the disadvantage of requiring a more permanent and less flexible installation of a pipe system to conduct the air to the working face. Electrical machines possess the advantage of having a light flexible installation through a system of wires by which the current is conducted to the working face. This system possesses the disadvantage, however, of possible danger to men and animals through contact with live wires or the ignition of gas when present, by the short-circuiting of wires or sparking of switches and other connections. Both of these systems possess the disadvantage of being interrupted by a possible fall of roof breaking the power line. In respect to economy, the question depends wholly on conditions in the field and whether a compressed air or electrical installation is already in use in the mine.

Ques.—If an air current of 20,000 cu.ft. per min. is circulated in an airway by 3.15 hp. and this current is increased to 40,000 cu.ft. per min., what will be the water-gage reading?

Ans.—The question is not complete, since it fails to state the cause of the increase of circulation from 20,000 to 40,000 cu.ft. per min. This increase in quantity may be due to an increase of *power*, in which case the pressure and water gage will vary as the square of the quantity; or, the power remaining the same (3.15 hp.), the increase in circulation may be due to the short-circuiting of the air current or the splitting of the air into two currents. We have, therefore, two cases, as follows:

1. When the power is increased to double the quantity, the water gage increases as the square of the quantity, and becomes four times the original water gage, for the same conditions in the mine.

2. If the power remains constant and the air current is short-circuited or split, the water gage varies inversely as the quantity of air in circulation. In this case, the air being doubled, the water gage will be reduced to one-half the original gage.

Ques.—What are the requirements of the law regarding measuring the ventilation, and how can the air current be measured? *Anthracite, Penn.*

Ans.—Once each week, the inside foreman, or his assistant, must measure the quantity of air in circulation with an anemometer or other efficient instrument, such measurement to be made at the inlet and outlet airways, also, at or near the face of each gangway and at the crosscutting nearest to the face of the inside and outside chamber or breast where men are employed. A report of these measurements must be sent to the inspector before the twelfth of each month, for the preceding month, together with a statement of the number of persons employed in each district of the mine.

The reading of the anemometer, divided by the number of minutes the instrument was exposed to the current, gives the velocity of the air in feet per minute. If care has been taken to obtain an average reading for the entire section of the airway, the area of this section multiplied by the indicated velocity of the current gives the quantity of air passing in feet per minute.

Ques.—Name two explosives in common use in blasting coal in gaseous mines.

Ans.—The permisible explosives as classified by the Federal Bureau of Mines will be found in Miner's Circular No. 6, pp. 15-16. Of these, perhaps the ones in most common use, are monobel, Nos. 2 and 3, and carbonite No. 1. Monobel No. 2 has about the same strength as a 40-per-cent. dynamite cartridge of the same size, but is much slower in its action, which feature adapts it to the mining of coal. This powder is practically without smoke or fumes and belongs to the ammonium-nitrate class of explosives. Carbonite No. 1 belongs to the nitroglycerin class of explosives and has about the same strength as monobel No. 2.

Book Reviews

PRACTICAL COAL MINING. By leading experts in mining and engineering under the editorship of W. S. Boulton, professor of geology, University College, Cardiff, Wales. 6 vol. In all 1197 pp. and 14 pp. of index. Well illustrated. 6¾x10⅛ in. Cloth bound. Also a booklet containing "manikin" of a winding engine 8x11¼ in. Paper bound. The Gresham Publishing Co., James Wolffsohn, controlling agent for U. S. sales, 11 Broadway, N. Y. Price, $12.

The reader will probably say when reading the above description: Why cannot we have a good book on coal mining published in America which will sell for a price equally reasonable? Unfortunately, so far no book of reasonable price has appeared from the press of this country, though in many ways a book published in America for Americans would better meet the demand of the market.

Yet we are far from denying that a foreign book has the advantage of a new viewpoint, and a man who is broad enough to comprehend the similarity of the problems and to differentiate them when they are unlike will be able to learn a great deal from this treatise. It must be acknowledged that while it is a foreign book, it is largely with such publications that it must compete, and for many years our mining libraries have contained at least as many English books as American.

The book has the merits of authority and modernity. The date 1913 on the title page is borne out in the text, though we think the remarks on the electric lamp by James Ashworth make no attempt to be abreast with the times. The reader will hardly recall the Trouvé, Sussmann, Bristol, Headland and Coad lamps which occupy the whole electrical field in Ashworth's treatment.

In Vol. I "The Geology of the Coal Measures" is acceptably treated by the editor himself. The illustrations are all from British examples, but most of the conclusions are broad enough to have a trans-Atlantic value. The account of the British fields is short and the author wastes no time in describing the continental coal measures. The "Composition and Analysis of Coal," by C. A. Seyler, public analyst for Glamorgan, Carmarthen, Pembroke and Swansea, follows.

BRITISH ANTHRACITE

His classification of coal is far more minute than is customary here. There are no less than 15 different divisions for coal varying from ortho-anthracite to lignitious coal. This first has from 3 to 8 per cent. of volatile matter, and Mr. Seyler says that the coal corresponds to the true anthracites of South Wales and America. The volatile matter in American anthracites roughly runs between 1.25 and 9 per cent., so it is clear that South Wales has coal which can be fairly designated as anthracite, according to even the narrowest interpretation of the term. The ortho-anthracite coals mentioned in the list are Capel Ifan, Trimsaran Green seam, Ynisgeinon, near Llanelly; Pwllfaron, near Neath; Cwmclick Upper or Penygraig seam; Pwllfaron 18-ft. seam, and the Trimsaran Gregog seam.

But while we, in America, agree with Mr. Seyler's definition of anthracite, we shall find it hard to call all pure coal containing less than 84 per cent. total carbon a lignitious coal. The Bruceton coal, according to this classification, would be bituminous, it is true, but the author would qualify it as per-para-bituminous. Not one analysis is given of either coal or ash. Nothing is said about sulphur. Most English books are incomplete in this regard as compared with American, but we cannot recall any as silent on this subject as is this one.

"Trial Borings" is well treated by H. F. Bulman, and "Shaft-Sinking," by Henry Louis, professor of mining, Armstrong College, Newcastle-on-Tyne, England. The latter is complete in all branches of the subject. "Breaking Ground" also falls to H. F. Bulman, and this subject covers explosives, shotfiring, drilling, the driving of rock headings and the mining of coal.

ENGLAND ALSO HAS SUBSIDENCE PROBLEMS

Methods of working and timbering are described by E. H. Robertson, professor of mining engineering, Calcutta, India. The description of roof strains is quite incomplete. However, we are glad to see the writer disagrees with the singularly ill-informed views of M. Fayol and M. Callon. It is interesting to note also that he states that: "Many towns in the United Kingdom have been undermined either wholly or partially. In Northumberland, on the west side of Newcastle-on-Tyne, 50 per cent. of the coal was extracted, while at Chorley, in Lancashire, 75 per cent. of the underlying coal at a depth of about 300 ft. has been worked. Many other instances, such as South Shields, Barnsley and Oldham, might be given."

"Haulage" is treated by G. R. Thompson, professor of mining, University of Leeds, and "Winding," that is, hoisting, by Charles Latham, professor of mining and mining engineering at Glasgow University. W. E. Lishman treats on "Pumping" and dams. Here are treated both rotary and air-lift pumps. "Ventilation" falls to the well known H. W. G. Halbaum, and he treats it in an historical and theoretical way. We are disappointed to see the Waddle, Walker, Shick and Capell fans alone treated and not in an adequate way. Nothing is said of the multiblade types. W. E. Lishman discusses "Transmission of Power in Electricity—Steam, Compressed Air and Hydraulics," and James Ashworth, whom our readers all know, the subject of "Lighting." While not strictly up to date, this department will be found fully as interesting as Mr. Ashworth's other writings.

No less a person than W. Galloway, formerly an inspector of mines, writes on "Colliery Explosions and Rescue Appliances." H. F. Bulman deals with mining law under the head of "Mineral Holdings," while "Mine Surveying" falls to L. H. Cooke, who treats the subject at considerable length. S. Warren Price, lecturer on mining at University College, Cardiff, discusses "Preparation of Coal for the Market," and some of the English methods of cleaning and screening are well worthy of investigation. W. Galloway takes up the consideration of "Coking and the Recovery of By-products." Nothing shows more clearly how much further British practice has advanced than ours than the fact that Mr. Galloway entirely ignores the beehive and belgian types of ovens, and nobody makes good his omission. H. Stanley Jevons, lecturer in economics and political science at University College, Cardiff, with David Evans, contributes "Economics of Coal," in which is treated supply and demand, opening of mines, profits, marginal productivity, size of operation, interest, wages, sliding scales, conciliation boards, wage scales, abnormal places, the strike of 1912, colliery legislation and its effects, housing, price regulation, marketing and shipping.

The chart we have called a manikin is a dissected illustration of a winding engine, prepared in a manner similar to the reproductions of the human body for studies in elementary physiology.

INTERNATIONAL CONFERENCE OF MINE-EXPERIMENT STATIONS. Compiled by Geo. S. Rice. Bulletin 82 of the Bureau of Mines. 5⅞x9⅛ in. Paper cover.

This report gives not only an account of the conference but several interesting and hitherto unpublished papers read before the meeting. For instance there is the statement of Horace C. Porter that "Experiments in which powdered coal was heated to 100 deg. C. (212 deg. Fahr.) in a current containing 50 per cent. oxygen have proved that the process of absorption of oxygen by coal (not producing carbon dioxide) is exothermic" that is heat giving. "Furthermore, the carbonaceous material absorbs oxygen more rapidly than does pyrite, this showing that oxidation of pyrite is not the principal factor in spontaneous combustion. Coal subjected to this action, the absorbing of oxygen without forming carbon dioxide, decreases in calorific value which is another evidence, as Taffanel has pointed out, that the action is exothermic."

He then goes on to show that coal artificially dried will rise rapidly in temperature when it takes up water. A few drops of water added to coal dried at 212 deg. Fahr. raised its temperature 23.4 deg. Fahr.

J. K. Clement stated that carbon dioxide deadened flame more than nitrogen. When 95 per cent. of the nitrogen of ordinary air is replaced by the dioxide of carbon, no mixture of such "air" and natural gas would explode in a gas pipette. This he ascribes to the greater specific heat of carbon dioxide which is 10.6, whereas that of nitrogen is only 7.2. There are several other interesting papers by G. S. Rice, L. M. Jones, J. K. Clement, H. C. Porter, J. W. Paul, H. H. Clark, A. C. Fieldner, G. A. Burrell, C. Hall and O. P. Hood.

Coal and Coke News

WASHINGTON, D. C.

The Interstate Commerce Commission has sent to the Senate during the past few days a reply to the resolution of some time ago in which Congress requested an investigation of the relation of common carriers to coal and oil and the transportation thereof. This particular report deals with the relations of trunk lines and their officials to coal operations in the State of Illinois and incidentally in the State of Indiana.

Answering the first element in the resolution, namely, whether and what carriers are interested in the coal they transport, the commission says that the Atchison, Topeka & Santa Fé owns the bonds of the Toluca Coal Co. which owns about 12,000 acres of coal lands and operates one mine with a daily capacity of about 1500 tons; that the Chicago & Northwestern Ry. owns the entire capital stock of the Superior Coal Co. and of various others producing about 2,000,000 tons of coal annually, the majority thereof being sold to the Northwestern.

The Chicago, Indianapolis & Louisville Ry. owns practically all of the capital stock of the Chicago & Indianapolis Coal Co. and is interested in various other coal concerns. The Missouri Pacific controls the capital stock of the Western Coal & Mining Co. which ships its coal over this same road. The Chicago, Milwaukee & St. Paul Co. owns the capital stock of the St. Paul Coal Co. which operates two mines yielding about 660,000 tons a year, the bulk of this being sold to the railway. The Illinois Central Railroad Co. indirectly owns the stock of the Madison Coal Corporation, which operates some six mines with a daily capacity of 10,400 tons.

Other railway companies and their coal ownership are described in like manner at great length.

In connection with the second part of the inquiry, namely, whether any of the officers of the roads or any persons charged with the duty of distributing cars to shippers are interested in coal operations, the commission finds that on the Toledo, St. Louis & Western, several officers were formerly interested in coal companies but that sundry of them have recently disposed of their stock. The Chicago Junction R.R. Co.'s president owns the stock of the Grant Coal Mining Co.

On the Missouri Pacific and St. Louis & Iron Mountain it was found that an indirect connection existed between the roads in question and the "Big Muddy" Coal & Iron Co. Three traffic officials of the Southern Railway Co. own small blocks of the securities of the Southern Coal & Mining Co. Possibly the most extensive treatment is given to the relations between the New York Central and the coal mines. On this the report says:

W. C. Brown and certain other officials of the New York Central lines were active in the promotion of two companies operating in Saline County—the Saline County Coal Co. and the O'Gara Coal Co.—and formerly owned large blocks of the securities of those firms; most of these persons, however, have now disposed of their holdings. The Saline County Coal Co. was incorporated in April, 1907, with a capital stock of $375,000. It later issued bonds to the amount of $300,000.

In October, 1908, the bonded indebtedness of the Saline County Coal Co. was increased to $1,000,000, of which there is said to be now outstanding $574,000. In July, 1910, the capital stock was increased to $1,250,000 of which there is said to be now outstanding $689,125. According to the record, the Saline County Coal Co. holds about 7000 acres of coal lands and mineral rights, about 80 per cent. of which is leased from the Cleveland, Cincinnati, Chicago & St. Louis Ry. Co. as indicated hereinbefore. The coal company owns three mines, one of which has been worked out and abandoned; the other two were constructed with the proceeds of the later issues of bonds and stocks and are located on property leased from the railway company and others.

The Saline County Coal Co.'s production for shipment is said to be from 80 to 100 cars of coal per day, part of which is sold to the New York Central Lines for locomotive fuel and the remainder commercially. It is understood that this company has recently acquired the control of the Harrisburg Southern Coal Co., operating a mine near Eldorado, in the State of Illinois.

The O'Gara Coal Co. was incorporated in July, 1905, and took over for development properties consisting of coal lands and mines which had been secured under options several months previously by Thomas J. O'Gara and others. The company was capitalized at $6,000,000 and later issued bonds to the amount of $3,000,000. It holds at present by lease and ownership more than 30,000 acres of coal lands and mineral rights in the Harrisburg district. It owns about 14 mines, 2 or 3 of which are now worked out and closed down. The company is said to produce for shipment from 200 to 300 cars of coal per day, a large part of which is sold to the New York Central Lines for locomotive purposes and the balance to other carriers and industries in Chicago, the West, and Northwest. In September, 1913, the O'Gara Coal Co. went into voluntary bankruptcy, and receivers in the persons of Thomas J. O'Gara and Fred A. Busse were appointed by the court to administer its affairs.

Additional Questions Discussed

The Commission goes on to discuss the various additional questions presented to it, such as the existence of contracts or conspiracies in restraint of trade to which coal carriers are parties and points out that the United States Steel Corporation controlled large mineral rights and railway communications therewith in Illinois.

As to the requirement that it report how the mines are treated in the distribution of cars the Commission says:

The problem of equitable car distribution is composed of two factors—(1) The ratings of the mines and (2) the actual distribution of equipment in accordance therewith. The purpose of a carrier in fixing ratings for mines on its lines is to determine the basis upon which each shall share in the equipment available for coal loading during the periods when the supply of cars is insufficient to meet all requirements. At such times it becomes necessary to place some restriction upon all the mines, and in order to do this impartially the practice of rating them and distributing the available equipment pro rata, on the basis of such ratings, has been adopted.

Many of the Illinois roads have published rules governing the ratings of mines and the distribution of cars among them, and practically all have some definite plan of handling car-shortage situations. These rules and plans, however, are not uniform on the several roads; on the contrary, each has endeavored to solve its own problem independently. A great deal of dissatisfaction has been felt by mine operators with the various systems of ratings and distribution, and numerous allegations of unfairness and discrimination have been made.

The result has been considerable litigation before this Commission and the courts. Generally speaking, Illinois roads rate the mines served by them on the basis of commercial capacities of the mines. If fair and correct methods of determining the relative capacities of mines are used, this may afford a reasonably equitable basis for rating, but, unfortunately, this has not always been the case.

A Radical Change in the Clayton Bill

In reporting the Clayton trust bill, on July 22, to the Senate, the Judiciary Committee of that body made, as the new draft of the measure shows, an important change in the form of the bill sent over by the House of Representaties, insofar as relates to mining. The Committee has left out of the bill entirely Section 3 which read as follows:

That it shall be unlawful for the owner, operator, or transporter of the product or products of any mine, oil or gas well, reduction works, refinery, or hydroelectric plant producing coal, oil, gas, or hydroelectric energy, or for any person controlling the products thereof, engaged in selling such product in commerce to refuse arbitrarily to sell such product to a responsible person, firm, or corporation who applies to purchase such product for use, consumption, or resale within the United States or any Territory thereof or the District of Columbia or any insular possession or other place under the jurisdiction of the United States, and any person violating this section shall be deemed guilty of a misdemeanor and shall be punished as provided in the preceding section.

Speaking of the reason for striking out this section, the Judiciary Committee says: "It would primarily deny freedom of contract to one of the parties, and consequently be of doubtful constitutional validity. Passing from this consideration, the Committee believes that such an enactment, which would practically compel owners of the product named to sell to anyone or else decline to do so at the peril of incurring heavy penalties, would project us into a field of legislation at once untried, complicated, and dangerous."

Little Progress in Investigation

In spite of continuous hearings during the past week, before the Senate Committee investigating the conditions of southern coal traffic with a view to ascertaining how far a so called trust exists in that trade, comparatively little progress has been made.

B. L. Dulaney, an independent coal operator of Bristol, Va., has made a long series of charges regarding the alleged policy of the Southern Ry. in connection with the handling of coal originating in the Southwestern and Appalachia fields. These charges have been answered by various persons, including Fairfax Harrison, president of the Southern Ry. and others, it being a claim that the Southern has not had any hand in driving individuals out of business or in

hampering one set of coal dealers in order to promote the interests of another.

One of the main points made by witnesses against the Southern Ry. was that directors of that road were also directors in other enterprises which did business with the road, particularly in coal enterprises of various kinds. This relationship has not been denied, but the claim has been strongly urged that none of the persons named have exerted an undue or improper influence in regard to the Southern's treatment of shippers and that all of them without exception have carefully recognized the line of division between their functions in connection with the road and their interests in other directions.

The whole investigation has had a tendency to drag and prediction is now made that little will come of it except the usual formal report with some reference to the undesirability of interlocking directorates and possibly criticism upon which the investigation seems to have disclosed some sidelight.

PENNSYLVANIA

Anthracite

Dunmore—Residents of the Green Ridge section of Dunmore are assured of surface support through an amicable settlement on July 23 of the appeal of Colonel George Sanderson and others, owners of the coal, from the assessment placed upon the mineral by the county commissioners. With counsel agreeing, Judge Newcomb made an order reducing valuation from about $60,000 to the nominal figure of $25,000. The order reads that the coal now in the tract is not to be disturbed, and that if in later years it is removed, those taking it from the ground must provide sufficient artificial support for the surface.

A petition was recently filed asking for the dissolution of the Nay Aug No. 4 Coal Co. This firm was organized in March, 1908, with offices in Dunmore. The petition states that the company has no debts, liabilities, or assets, and has all state taxes fully paid.

Carbondale—Estimating that at least 100 tons of coal is stolen daily and determining to put a stop to this practice, officials of the Delaware & Hudson Co. have issued orders for the road detectives to keep close watch on persons who pick coal from cars stored in yards along the line. It is said that the company is not opposed to coal picking from the ground, but of late inroads have been made on loaded cars, and this the officials are determined to stop.

Pottsville—The Philadelphia & Reading Coal & Iron Co. has caused great surprise by raising the price of coal in this part of the anthracite region 11 cents per ton, with a statement that another raise may be made shortly. As this region has never been allowed the spring reduction of 50 cents per ton, it has never heretofore figured on the monthly increase of 10 cents. The public is unable to understand the attitude of the mining company. It is believed, however, that the Reading is making this advance in price at the mines, anticipating a decision favoring lower freight rates on anthracite to Philadelphia.

Bituminous

Pittsburgh—Coal companies which have been making shipments to the lakes for Northwest markets under a reduced rate for some weeks past were recently notified that the last of the large coal storage docks on the upper lakes have been filled up, and further shipments to that point would have to cease until the congestion diminishes. According to reports, this change will not be possible before the middle of August when the grain movement from the Northwest starts.

Somerset—The second annual Somerset County Miners first aid meet under the direction of the industrial committee of the state Young Men's Christian Association was held July 25, in charge of George B. Landis, of Harrisburg, and A. W. Harris, of the U. S. Bureau of Mines. Prizes for the various events were as follows:

One-man event, Ralphton team of the Quemahoning Coal Co. Two-man and three-man event, Myersdale team, No. 1 of the Consolidation Coal Co. Team event, first prize, Orenda No. 2 team, of Somerset Smokeless Coal Co. Second prize, Jerome No. 2 team, of the Jenner Quemahoning Coal Co.

Ralphton—The contest between the Jenner Brewing Co. and the Quemahoning Coal Co. over the selling of beer in this town, which is owned by the coal company, is to be taken to court. A mine foreman was arrested several days ago while carrying out the company orders to prevent the delivery of the brewing company's product in the town. It is claimed that a similar case has already been decided in favor of the seller in a contest between a merchant of Fayette County and a coal company which owned a town there. It is said that this case, if it goes against the coal company, will have the effect of opening all the coal towns in Somerset County to merchants, brewers or others who may desire to sell articles, regardless of the fact that the coal companies may own the land, streets, houses and industries of the community. The case will be watched with considerable interest because of the issue involved.

Du Bois—A meeting of mine foremen, assistant mine foremen and fire bosses has been called for July 28, at which time endeavors will be made to organize a Mine Officials' Beneficial Corporation. The object is mutual benefit through sick, accident and death payments to its members. Only mine officials will be eligible for membership. At present mine officials are without benefits, other than those provided by the coal companies.

Ache Junction—The new plant of James H. Hoover will consist of 100 beehive ovens of the large pattern equipped with mechanical drawers and loaders. His present plant, which is known as Hoover, consists of 74 ovens.

Rockwood—The big wooden frame tipple of the Bradenburg Coal Co. was totally destroyed by fire on the morning of July 20, entailing a loss of several thousand dollars. The cause of the fire has not been ascertained.

WEST VIRGINIA

Matewan—The Stone Mountain Coal Corporation with headquarters at Roanoke is installing at its Marvin mines Nos. 1 and 2 the weigh check system, which will be in operation in the course of a short time. These will be the only mines in this part of the state using the mine scales, and operators are much interested to know what the final outcome will be.

Charleston—After being idle since June 1, the Winifrede Coal Co. has resumed operations. Since the strike was settled throughout the Kanawha field about two weeks ago, there has been a shut-down at the Winifrede mines on account of failure to have sufficient orders to justify operations. About 400 men will be employed at Winifrede.

Kingwood—Mine No. 4 of the Elkins Coal & Coke Co. recently resumed operations after a shut-down of several months. The resumption of work at this mine is an indication of the picking up of the coal market, which has been on a bad slump for several months past. A gradual increase is expected from now on. When running full No. 4 mine gives employment to about 200 men, approximately half of which are at present employed in this operation.

ALABAMA

Birmingham—Thirty-three out of 59 miners standing examination the past week for first and second class certificates and for fire boss positions passed. J. F. Young of Palos, Ala., won the highest mark, this being 97. He was standing examination for fire boss. E. M. Owens of Pratt City received the highest mark for first class certificate ,receiving a grade of 92½. Mr. Owens is at present an engineer of the Tennesee Coal, Iron & R.R. Co. The class was the largest ever handled by the Examining Board.

KENTUCKY

Barbourville—Full time operations are the rule at most of the mining plants in the southeastern section of Kentucky, according to the leading operators hereabouts, and it is expected that the next few weeks will see operations active. Harlan County has advanced to a front rank in the list of coal producing localities as a result of numerous prosperous mining plants. The largely increased output of the Harlan mines is taxing the facilities of the Louisville & Nashville R.R. to handle the coal turned over to it for transportation.

OHIO

Zanesville—A $2,000,000 merger in the coal, sand and brick business was completed here recently, the companies in the deal being the Northern Coal Co., the Monitor Coal Co., the T. B. Townsend Brick & Contracting Co., and the L. K. Brown Sand Co. The new concern will be known as the Burton-Townsend Co. The capacity of the operating plants will be quadrupled. The company owns 300 acres of coal lands and has options on several thousand more.

Columbus—Although the Lloyd conservation bill, passed in the recent one-day session of the legislature, gives the state exclusive ownership and control of all minerals on school lands, it is announced by State Auditor A. V. Donahey that there is no intention to attempt to operate oil or coal properties. The enactment of the law was followed by rumors that the state would take possession of and operate coal and oil lands, but this is not to be done. Instead, matters will be adjusted with persons now operating on state land on a royalty basis, which is expected to prove mutually satisfactory.

INDIANA

Linton—Eighty men at Vandalia mine No. 9 recently went on strike and the mine closed down. The company desired to put two men in entries and the miners refused to allow more than one.

Terre Haute—The Fauvre Coal Co., Indianapolis, has leased its mining property west of this city to the recently incorporated Sunbeam Mining Co., owned by the Harder and Hafer interests of Chicago and James McClellan, the veteran operator of Brazil. The lease covers 823 acres and a mine. It runs for ten years. The Fauvre company will receive a royalty of 3 cents per ton on mine-run and 5 cents on 1¼-inch and above, its royalty not to amount to less than $3000 a year.

ILLINOIS

Virden—Mine No. 2 of the Montour Coal Co., located at Virden, has been closed for repairs.

Andrews—The Cora Coal Co. has resumed operation at its mine located at Andrews, near Springfield. The top works of this mine were burned March 17 last and an up-to-the-minute steel equipment with shaker screens has been erected capable of loading five sizes at the same time.

Springfield—The Springfield Mining Co. has opened up the No. 5 mine, which has been idle since last winter, when the above named company went into the hands of a receiver. There are rumors that a new escapement shaft will be put down in the near future.

Mines throughout this district are working a little better, business having been poor for some time.

Belleville—It is rumored that a deal involving the transfer of more than $5,000,000 worth of coal lands including 30 mines on the Illinois Central R.R. between Belleville and Coulterville, Ill., will be consummated within the next 30 days. It is said that already options on 25 mines in the Belleville district have been given a French syndicate which is seeking a strong foothold in this region. The list includes among the larger mines Marissa, Coulterville, Freeburg, and New Athens.

MISSOURI

Kansas City—The chief stumbling block between the Southwestern Interstate Coal Operators' Association and the mine workers of Missouri, Kansas, Arkansas and Oklahoma was removed recently when a method of conducting future arbitrations was adopted. The new plan is modeled after that in effect in Illinois and one or two other states. It does away with the one-man board of arbitration, and provides for a board of six men in each district. Three operators and three representatives of the U. M. W. of A. will constitute the board. John Steel, of Pittsburg, Kan., has heretofore held the office of arbitrator. Many of the miners are anxious for him to finish his term. The wage scale and other matters are now being taken up by the association and miners.

ARKANSAS

Fort Smith—Franklin Bache, head of the Bache-Denman Coal Co., was appointed receiver for nine companies on July 25, following a voluntary petition filed in the United States District Court at Fort Smith. The companies affected are: Coronado Coal Co., Mammoth Vein Coal Co., Mammoth Vein Coal & Mining Co., Prairie Creek Coal & Mining Co., Hartford Coal Co., Bache-Denman Coal Co., Sebastian County Coal Co., Denman Coal Co. and Kali-Inla Coal Co. Five of the companies lost their surface plants in a riot on July 17. As a result of this destruction of property, 71 indictments have been returned by the Sebastian County grand jury. At least two employees of the coal companies were killed.

TEXAS

Fort Worth—The old wage scale existing between District No. 21, U. M. W. of A., and Texas operators, was renewed at Fort Worth on July 24. A new arbitration plan was adopted, providing that an arbitrator shall act at the scene of the trouble and that either side can appeal from his decision to the general arbitration board of three miners and three operators.

FOREIGN NEWS

Berlin, Germany—The Kaiser Wilhelm Institute for coal mining research will shortly be opened in Mülheim-im-Ruhr. This institute is a branch of the Kaiser Wilhelm Society for Scientific Research, of Berlin, but its scope is so important that it has been established as an independent concern. The municipality of Mülheim-im-Ruhr which is in the heart of Germany's richest coal belt has provided $175,000 for erecting the institute building.

PERSONALS

J. P. Crutsinger, manager of the Exchange Coal Mining Co. of Wellington, Mo., has resigned to locate in Mexico. He has been succeeded by Henry Mignery.

Charles K. Scull, a prominent coal merchant and secretary of the Philadelphia Coal Exchange, was elected Imperial Modoc, the highest ranking office, at a recent meeting of the Order of Kokoal.

J. D. Cain, of Pineville, Ky., has been appointed Assistant State Inspector of Mines for a term of four years, beginning Aug. 1. Mr. Cain succeeds Perry V. Cole, also of Pineville, and who has held the office for some time.

A. W. Hesse, formerly assistant chief engineer with the Consolidation Coal Co. of Fairmont, W. Va., has accepted the position of manager with the Lincoln Coal Mining Corp., a new concern with mines located at Big Creek, W. Va.

John O'Conner, who for 10 or more years has been identified with the office of the Rochester & Pittsburgh Coal Co., at Punxsutawney, Penn., has gone with the Brush Creek Coal Co., at Aultman, Indiana County. His new position will be auditor and assistant treasurer.

Hywel Davies, of Louisville, formerly one of the best known coal operators in the state, now business manager of the Kentucky State University, recently underwent an operation for appendicitis at the Good Samaritan Hospital, at Lexington. He is reported to be progressing favorably. He was one of the mediators selected to try to bring about a settlement of the recent Colorado mine troubles and formerly was president of the Kentucky Mine Operators' Association.

RECENT COAL AND COKE PATENTS

Boiler. A. C. Wood, Philadelphia, Penn. 1,097,599. May 19, 1914. Filed May 14, 1913. Serial No. 767,511.

Mine Door Closer. T. Ramsey, Roslyn, Wash., 1,100,690, June 16, 1914. Filed July 17, 1913. Serial No. 779,643.

Gas Producer. C. Whitfield, London, Eng. 1,096,774. May 12, 1914. Filed Feb. 3, 1914. Serial No. 816,163.

Ash Pit Dumper. T. E. McCall, Wilmington, Del., 1,100,982, June 23, 1914. Filed Oct. 31, 1913. Serial No. 798,417.

Mining and Loading Apparatus. F. Billings, Cleveland, Ohio. 1,095,786. May 5, 1914. Filed Jan. 17, 1910. Serial No. 538,408.

Coal Washer. Henry Cory, Dormont Borough, Penn. 1,095,817. May 5, 1914. Filed Mar. 25, 1913. Serial No. 756,691.

Automatic Stoker. W. C. A. Henry, Columbus, Ohio. 1,096,106. May 12, 1914. Filed Aug. 7, 1912. Serial No. 713,924

Apparatus for Cleaning Smoke. J. D. Jackson, Kensington, Australia, 1,100,307, June 16, 1914. Filed Aug. 26, 1913. Serial No. 786,763.

Coal Washer. H. Shannon, assignor to Link-Belt Co., Chicago, Ill., 1,100,921, June 23, 1914. Filed Sept. 7, 1907. Serial No. 391, 762.

Drying Coal Slimes. H. Brune and H. Horst, Neustadt-on-the Hardt, Germany, 1,100,710, June 23, 1914. Filed Oct. 28, 1912. Serial No. 728,272.

Mining Machine. A. H. Gibson, assignor to Ingersoll-Rand Co., New York, N. Y. 1,096,031. May 12, 1914. Filed Sept. 7, 1912. Serial No. 719,186.

Device for Emptying Upright Coking Chambers. A. Gohmann, Stettin, Germany. 1,095,725. May 5, 1914. Filed Jan. 17, 1913. Serial No. 742,548.

Apparatus for Consuming Smoke in Locomotive Furnaces. G. de Grahl, Zehlendorf, Germany. 1,095,629. May 5, 1914. Filed July 22, 1912. Serial No. 710,971.

Gas or Smoke Washer. O. M. Foster, assignor to American Smoke Washing Co., Cleveland, Ohio. 1,096,501. May 12, 1914. Filed July 8, 1912. Serial No. 708,133.

Means for Utilizing the Residual Heat of Coke Produced in Vertical Gas Retorts. H. J. Toogood, Elland, England. 1,101,477, June 23, 1914. Filed June 25, 1912. Serial No. 705,766.

CONSTRUCTION NEWS

Macdonaldton, Penn.—The Brothers Valley Coal Co. has placed a contract with the Roberts & Schaefer Co. for the building of a second Marcus patent coal tipple, which will be installed at Macdonalton, Penn.

Pottsville, Penn.—It has been unofficially stated that the Philadelphia & Reading Coal & Iron Co. will in the future plan to erect a large power house at Pottsville, which will supply power to all parts of the Schuylkill Valley, and down as far as Philadelphia.

Huntington, W. Va.—Three large coal mines will shortly be opened on the Main Island Creek branch of the Chesapeake & Ohio R.R. Hunt & Forbes, the wellknown firm of contractors have closed contracts with the mining companies to lay side tracks to the new mines.

Baltimore, Md.—The city is now preparing a plan for harbor dredging that will enable deeper draught vessels to come into the inner harbor. This will permit some of the larger vessels to coal at the Locust Point pier of the B. & O. instead of lightering fuel or going to Curtis Bay.

Herrin, Ill.—The Chicago & Carterville Coal Co. has awarded a contract to the Roberts & Schaefer Co. for the rebuilding of its complete coal mining plant, recently destroyed by fire (the original plant having been built by the same company), at an approximate contract price of $20,000.

Sparrows Point, Md.—The efficiency of the plant of the Maryland Steel Co. is expected to be materially increased by the addition of 120 coke ovens, to its already large equipment. One-half of these ovens were recently completed and placed in operation, the output being estimated at 500 tons daily.

Paducah, Ky.—The West Kentucky Coal Co. has been given a contract to build six barges at its plant here for the Paducah & Illinois R.R. Co., which is building the bridge at Metropolis, Ill., 12 miles below here. The cost will be $12,000. Aside from these barges, which will be used in building the bridge, the railroad company has bought three others.

NEW INCORPORATIONS

Covington, Ky.—The Pittsburgh Mining Co. has increased its capital stock from $24,000 to $30,000.

Hazard, Ky.—The Middle Fork Coal Co. has been incorporated here by B. P. Wooten, C. G. Bowman and Jesse Morgan.

Prestonburg, Ky.—The Big Sandy Consolidation Fuel Co. has been incorporated with a capital of $250,000. The incorporators are, B. F. Friend, C. R. Brown and D. C. Outcalt.

Welch, W. Va.—The Pocahontas Engineering, Mining & Construction Co. has been organized for the purpose of engaging in mine construction work. The capital stock is fixed at $25,000.

Foxholm, N. Dak.—The Foxholm Coal Co. has been organized with a capital stock of $10,000. The incorporators are J. A. Kann, R. W. Kann and John P. O'Leary, of Foxholm, N. Dak.

Athens, Ohio—The Del Carbon Coal and Coke Co., of Buffalo Creek, W. Va., has been sold to Alexander Cunningham and Charles R. Neidlinger, of New York City. The consideration is not given.

Sesser, Ill.—The Jesse Dimond Coal Co. has been organized with a capital stock of $100,000 for the purpose of mining coal, manufacturing coke, brick, etc. The incorporators are, E. N. Rea, H. M. Rea, and Jesse Dimond.

Charleston, W. Va.—The Kanawha Valley Coal Co. was recently incorporated with a capital stock of $25,000, to engage in coal mining. Those interested are Otto J. Cox, Roy Cox, John A. Field and S. P. Richmond, all of Charleston.

Esserville, Va.—The J. A. Esser Coke Co. has been incorporated with a capital of from $50,000 to $100,000, the purpose of the organization being coal mining and coke manufacturing. The officers are, John A. Esser, pres., George H. Esser, vice-president and Esther F. Esser, secy., all of Norton, Va.

INDUSTRIAL NEWS

Washington, D. C.—The Navy Department recently awarded to S. F. Hayward & Co., of New York City, an order for 30 sets of Westfalia rescue helmets for use on government colliers.

Ottawa, Ont.—The number of people in Canada affected by industrial accidents during June were 593. Of that number 299 were killed, and 294 seriously injured. Owing to the Hillcrest disaster, the mining industry heads the list with 200 killed and 27 injured.

Pittsburgh, Penn.—With coal operators assembling large tows in the local harbors preparatory to a shipping stage, it is estimated that at least 18,500,000 tons of coal will be ready to be moved as soon as sufficient water arrives. Little immediate change in the rivers is, however, anticipated.

Whitesburg, Ky.—Stone, a new mining town in Pike county, is to have a national bank with a capital of $50,000, according to information available here. This institution is expected to begin business before the end of August and will give Pike county its fifth bank. The four others are all doing a flourishing business.

New Florence, Penn.—Several hundred acres of valuable coal land have been transferred recently in this vicinity to interests believed to be from Bolivar. It is said that a number of new openings are to be made in the near future which will mean a decided boom in business and population. Most of the coal involved lies under what is known as the old Graham farm.

Rockport, Ind.—Residents of the Ohio Valley near here are digging quantities of coal out of the bed of the Ohio river. The coal is part of 15 barge loads which were in tow of the "Sprague" several years ago and which were swamped during a severe storm. This summer for the first time since the tow was wrecked has the river been low enough to get at the coal.

Columbus, Ohio—The Ohio Utilities Commission has approved the application of the Chesapeake & Ohio Northern R.R. Co. to issue stock to the amount of $50,000 for the purpose of securing a right of way for the new line to be built by the Chesapeake & Ohio from Portsmouth to Columbus. It is expected that the contracts for the construction of the line will be awarded within the coming month.

Birmingham, Ala.—A foreclosure deed transfering the properties of the Markley Coal Co. to the State of Alabama was recently filed in the Probate Court. The state bought in the property for the use of the Alabama Girls Technical Institute. The price paid was $135,645.89 and the property involved includes 9514 acres of land located in Jefferson and Tuscaloosa Counties. The mortgage under which the property was sold was for $148,763.24.

Trenton, N. J.—Upon the application of Edward D. Fox, Vice Chancellor Beckes on July 21, named Frank D. Schroth, of Trenton receiver for the Eggette Coal Co., of Trenton and Camden. The concern was incorporated with a capital of $100,000 for the purpose of manufacturing artificial fuel. Fox charges that the company has practically suspended business, and that for some time preceding this suspension business was conducted at a loss.

St. Louis, Mo.—Contracts for 80,000 tons of coal for the City Water Works and the City Sanitarium were recently let, at a total cost of $117,156, a saving over last year's prices of $4150. There were eight bidders. Donk Bros. got 50,000 tons of coal for the City Water Works at Bissell's Point at $1.39 f.o.b. cars Bissell's Point. The freight rate on this is 52c. per ton. They also got 10,000 tons of washed coal for the City Sanitarium, at $1.56½ per ton delivered. The Bald Eagle Mining Co. got 20,000 tons of nut coal at $1.60 per ton, as compared with a price of $1.62 last year.

Bristol, Tenn.—The Virginia & Southwestern Ry., one of the important coal carrying lines reaching the southwest Virginia coal fields, has received its first consignment of 600 modern steel coal cars, which will be put into service immediately. The new equipment will be used in hauling coal from the mines of Virginia, particularly from Lee and Wise counties. R. Loyall, who has general supervision over the middle district of the Southern, commenting on the new equipment, said that it would make the Virginia & Southwestern one of the best equipped coal carrying railroads in the country.

Coal Trade Reviews

General Review

Anthracite trade touches the low point of the year. Firmer tone and improved sentiment in bituminous. Stocks exhausted and buyers finding they have overstayed the market.

Reports from some points indicate the dullest situation in the hard-coal trade for the past decade. The large companies are working on a heavily curtailed schedule, consumers are showing no disposition to stock up and the individuals are making deep cuts into the regular circular, in some cases even down to the April prices or better. A slight temporary activity prevailed during the past week in anticipation of the regular advance in the circular on Saturday, Aug. 1. Aside from this the situation has been most depressing and the increase in the circular will tend to discourage further buying for the time being.

Contradictory crosscurrents are developing in the Eastern bituminous situation which are strongly indicative of a change in sentiment. An easing off in the demand from the West has diverted more coal into the seaboard market which has been a depressing influence, but on the constructive side it is noticed that the heavy reserve stocks, which has been a constant menace to the market for so long, are completely exhausted. There is a growing belief that many consumers have overstayed the market. The rigid curtailment in operations has kept shipments well inside of market requirements, and there is little consignment coal reported at any of the large distributing centers, while generally stiffer prices are quoted on contracts.

The Pittsburgh district is showing a tendency to drag behind, there being no increase in mine operations although the reduced stocks in consumers hands has induced slightly better buying in the line trade. Prices are still subject to heavy cuts, but with the greater industrial activity and heavier Lake shipment through August, the outlook is more hopeful; tonnage will have to experience a big increase, however, before the improvement will be reflected in the prices. The improved sentiment still continues in Ohio. The trade his tightened up in excellent shape and there is a fairly good domestic business ready when the local mines get under operation. A fair sprinkling of idle factories are beginning to fire up while the railroads are placing additional orders.

The Southern railroads have also increased requisitions somewhat which has had a stimulating effect on the market as a whole although there is little improvement in the general industrial call. Prices continue steady so far with increases freely predicted for the near future.

The Middle Western market has taken another spurt and with normal conditions prevailing will show a steady and consistent increase from now on into the fall. The harvesting is on in full swing while prices are steadier and the improved sentiment is creating more buying in all lines. Substantial advances in quotations are anticipated during the next few weeks. The summer buying was considerably below the average and more than a normal tonnage will be required to make up the deficiency.

ATLANTIC SEABOARD

BOSTON

Price situation on Pocahontas and New River being corrected, but tonnage will be light for some time. Improvement in call for Pennsylvania grades continues. Georges Creek firm, with better trade conditions in sight. Anthracite dull and price shading on part of independents so far without result.

Bituminous—August promises some relief to the price situation, but the volume of Pocahontas and New River coming forward will probably be light. The operators are now apparently reconciled to the strictest kind of curtailment, and it is understood that cargoes will not be put afloat by the various agencies without firm orders in hand. Meanwhile, practically all of the distress coal at New England ports has been absorbed in one way or another and on car prices for inland delivery have been restored to the season-contract basis. For some weeks, therefore, there will probably be very little business aside from the large consumers, who are taking coal regularly in weekly proportions. It is gratifying to the trade generally that the bad July situation has been corrected, and all hands will now look forward to a better fall market than could have been forecasted a month ago.

The slight improvement noted last week in the demand for the better Pennsylvania grades continues to hold good. Buyers who have been awaiting developments and hoping for lower prices are now concluding to take on supplies, and the effect is already noticeable. The strengthening in the Hampton Roads coals will also have a favorable result on the market for Cambria and Somersets. Some of the operators report plenty of current business and it begins to look as if bituminous generally in a month or so would be over the hump.

There is no feature in the Georges Creek demand, although the shippers see signs of an increasing number of requisitions during August. Barges and steamers carrying this grade have been operating regularly and there is no change to report on prices.

Anthracite—The trade continues as dull as usual in the midsummer season. A rigid curtailment has been in force with most of the mining companies and shipments have been relatively few the past fortnight. Independent operators are circularizing this territory with offers of domestic sizes at concessions from the companies' lists, but so far they have made very little headway. This market has always been loyal to the interests that serve it best in times of stress, and the mere concession in dull times of 25c. or even 50c. does not interest more than a few of the dealers to the point of buying.

The Cape Cod ship canal was formally opened with appropriate exercises on Wednesday, July 29 ,a large party going from Boston to participate.

Current prices on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahonta* New River
Mines*	$0.90@1.45	$1.20@1.65	$1.67@1.77	
Philadelphia*	2.15@2.70	2.4 @2.90	2.92@3.02	
New York*	2.45@3.00	2.7 @3.20	3.22@3.32	
Baltimore*	.....	.....	2.85@2.95	
Hampton Roads*	.....	.....	.....	$2.75@2.85
Boston†	.....	.....	.....	3.58@3.65
Providence†	.....	.....	.....	3.68@3.78

* F.o.b. †On cars.

NEW YORK

Indications of an improvement in bituminous. Calls on contracts picking up and reserve stocks generally exhausted. Usual month-end rush for anthracite creates some activity, but operations still heavily curtailed and trade slow.

Bituminous—Distinct evidences of an impending improvement are discernible in the local soft-coal trade. There is a growing belief that many consumers have overstayed the market and that a broad buying movement will be initiated shortly which will put the trade on a firm basis. The heavy reserve stocks accumulated early in the year, which have since

been a constantly depressing feature in the market, are now generally cleaned up; as a result requisitions on contracts are larger all along the line, and a few inquiries for prompt shipment are beginning to drift in.

A rigid curtailment policy on the part of the operators

has kept the movement down to actual requisition so that no demurrage coal is in evidence, and there is a healthy situation prevailing as regards the stocks at tidewater. Indications of an improvement in industrial conditions is also noted in the better demand on contracts which may be due in part, however, to the final cleaning up of surplus stocks. Although still quiet, the last half of July witnessed a generally accumulating strength which finds the current month opening with the trade even moderately active and indications of a further improvement later. Prices are somewhat steadier on the basis quoted for the past few weeks, which are as follows: West Virginia steam, $2.50@2.60; fair grades Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The end of the month bringing with it the customary advance on the domestic grades, created the usual small rush of orders from consumers anxious to get in at the expiring low rate. Aside from this the market continues inactive. Nearly all the large companies reduced operations to little more than half capacity last week, the only important exception being the Lehigh Coal & Navigation Co., which continued at full time throughout the week. The independents, by forcing the market with heavy cuts on the company circulars, are doing much better. As a result of the regular monthly advance in the circular, effective on Saturday, a further restriction in the demand during the coming week is anticipated.

The shortage of stove coal continues the predominating feature in the market. The companies are still taking advantage of this deficiency to accelerate the movement of the heavier grades such as egg and chestnut, only recognizing orders for stove coal when accompanied by requisition for a certain proportion for other sizes. The output of the steam grades is so restricted, as a result of the curtailed mining operations, that the entire production is going into the market and practically none is being put back into storage now.

We quote the New York hard coal market with the company circular 10c. higer on the domestic grades, as follows:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.00	$4.60@5.00	$4.95	$4.55@4.95
Egg	5.25	4.90@5.25	5.20	4.85@5.20
Stove	5.25	5.15@5.25	5.20	5.10@5.20
Chestnut	5.50	4.95@5.50	5.45	4.90@5.45
Pea	3.55	3.40@3.55	3.50	3.25@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.10@2.75
Rice	2.30	2.15@2.30	2.00@2.25	1.60@2.25
Barley	1.80	1.60@1.80	1.75	1.25@1.75

PHILADELPHIA

Anthracite trade still dull and featureless with operations at only 50% capacity. Concessions freely made by individual operators. Bituminous shows better inquiry, but little doing in way of new business.

Anthracite—The first of August finds the anthracite trade passing through one of the dullest periods it has experienced for the last ten years. Inactivity in almost all sizes is noted, with the possible exception of broken and stove; the curtailed operations at the mines has made the market very short of the former, and it requires considerable jockeying to fill contract requisitions. Stove coal has its uses also, in that orders for it carries some of the other sizes, but the trade as whole is exceedingly dull. The slack demand for pea size, which is used to a great extent in this market for domestic purposes, still continue and it is understood, even with the half-time work at the mines, that considerable of it continues to go into stock. The circular price of $2.50 at the mines, is being cut right and left by the individual operators, who, however, are not confining their efforts to this one size. Concessions on egg and nut in some cases net the operator less than April circular, and this condition of affairs is not likely to change for the next six weeks. Dealers and operators generally in this vicinity are looking for an earlier fall demand than is usually the case.

Bituminous—There seems to be a better inquiry in the soft-coal market, but little is developing in the way of actual orders. Spot coal is not easy to dispose of, even at the prevailing low prices, but even in the face of this, inquiries for contracts are met with substantially higher quotations than those ruling at present. This is not likely to improve a condition now existing, when establishments can buy on the market at considerably less than they can contract. It is the feeling among the operators that late fall and winter will see substantial increases in the prices on all grades of bituminous.

BALTIMORE

Anthracite men complain that many customers are not covering. Bituminous market conditions continue highly unsatisfactory. Export trade holds up.

While the early weeks of the summer saw the anthracite men fairly cheerful under the belief that the light demand for coal for storage as well as for immediate use would soon see a change, a different spirit now prevails. It is undoubtedly a fact that far less coal has been placed in bins this year than for a number of years past. Neither is there much of a disposition on the part of consumers now to take advantage of the remaining low prices, and a rather dull August seems to be in prospect. There is no explanation as to why the household consumer, who is usually in at this time, is still holding off. Light manufacturing call is, of course, understood in the face of the poor industrial situation generally.

Highly unsatisfactory conditions prevail in soft coal. Call to the West has slackened somewhat, and little or no market exists East, outside of contract business. With this at low ebb there is not much satisfaction in it for the coal man. Prices are hard to fix in such a market, but prompt sales, not under pressure, are about on a level with the previous week. In West Virginia, steam coals sold around 90c.; three-quarter-gas sold variously at from 80 to 90c., and slack was disposed of in some cases at 65c. Pennsylvania coals range at from 95c. to $1.35. The market was poor for all. Bunker trade is about the most healthy business here just now.

HAMPTON ROADS

Dumpings for the week are light. Government takes 10,000 tons at Newport News. No change in prices. Improvement anticipated this week.

Coal movement from Hampton Roads during the last week has not been heavy; in fact there have been days during the week when all piers were practically idle. The largest cargo was taken by the collier "Orion' loaded at Newport News, and outside of several large cargoes to Naples and Genoa the foreign movement was light. In addition to the shipments to Italian ports, foreign cargoes went to Bridgetown, Coronel and St. Thomas.

The demand for all classes of coal still continues light and there is little inquiry in the market at this time for either coastwise or foreign spot business. The greater part of the cargoes moving coastwise went to Boston although there were some shipments to Providence and Portland and some small lots to one or two of the Southern ports.

There is no change in prices in any of the grades. Prospects are good, however, for some improvement in dumpings during the coming week, a fair number of vessels being due for shipments moving on contract. The U. S. Collier "Proteus" is due to load about 10,000 tons applying on the contract recently let by the government.

CHARTERS

Coal Charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tonnage	Rate
Oclande[2]	Norwegian	Philadelphia	Martinique	1874	.....

LAKE MARKETS

PITTSBURGH

No recent change in production, which is running about 10% better than in June. Further increase expected in August. Prices on prompt coal still very irregular, but slack has slightly advanced.

There has been no change in the rate of mining in the Pittsburgh district in the past two or three weeks. As a general average, the mines are running at a trifle better rate than in June by perhaps 10%, and operations average between 60 and 65% of normal capacity. There has been an increase since June 1 of about 10% in the line trade, due to the reduction of consumers' stocks rather than to any increase in the rate of consumption, and there has been a slight increase in Lake shipments. Demand for coal is expected to be considerably better in August. Manufacturing operations are expected to increase, while the Lake trade should take a larger tonnage.

Prices on prompt lots are being deeply cut by the smaller shippers, as for many weeks past, and there is no established market. It may be stated that odd lots of mine-run

could be picked up at $1 to $1.10, and possibly at less. Slack, however, shows a slightly firmer position in the past ten days. A fortnight ago slack could be picked up in considerable quantities at 50c., but it is stated that at present nothing below 60c. could be done, and it would not require the buying of any considerable tonnage to exhaust all available at this figure, putting the market to 65c.

An indication of the improvement in the position of slack with respect to production and consumption is found in the experience of the Pittsburgh Coal Co. This interest never sells slack at cut prices in the summer, but stocks what is necessary during the Lake shipping season, to carry its contracts through the winter, when production of slack is decreased through the cessation of Lake shipments. For five or six weeks past this interest has not stocked any slack, but is able to dispose of its current production by shipments on its regular contracts. Circular prices remain as follows: Slack, 80@90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in., $1.50, per ton at mine, Pittsburgh district.

BUFFALO

Movement a little better in bituminous, but anthracite as dull as ever. Expected that the fall crop movement will produce a stir, if only by creating a scarcity of cars. Mine shipments made only on specific orders. Short time operations the rule.

Bituminous—There are a few members of the bituminous trade who find their shipments on the increase. Prices are not affected, but that is to be expected, as the volume must increase very materially before this occurs. Still dealers are encouraged, for they believe that the fall situation, especially the crop movement, must help all sorts of business. Besides it will create a scarcity of cars and that alone will advance the price of coal. All members of the trade are carefully watching for the time when the railroads begin to buy. When that happens the worst will be over. Some difference of opinion exists as to the fuel supply of the roads, but it is the general idea that they are using more than they are buying.

The late improvement in slack has been ascribed to the light Lake movement of bituminous. This is likely to continue because of the small storage capacity at Upper-Lake ports. There is a close watch kept on shipments from all mines, for there have been too many losses on coal standing on track. Mines are running on short time and if there are no orders they shut down.

The state of the market is not well represented by quotations, as practically all coal would bring the full circular if business was brisk. When it is not, only the best sells on regular quotations, which are $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack. The demand for slack is somewhat better than it was. Allegheny Valley sizes are about 25c. lower than Pittsburgh, slack being on a par with it. There is considerable low grade slack coming in from beyond Pittsburgh, which sells very cheap.

Anthracite—The trade is improving. Some shippers note that there is great surplus of egg, which embarass the mines considerably. Because of this or some other reason the mines have not furnished coal enough during the week to keep the docks busy and the Lake shipments have fallen off, though the July total still promises to be high. No prospect of improvement in the local rail-line trade appears at present.

Shipments by Lake for the week were 167,000 tons, practically all to principal Upper-Lake ports. The smaller ports have dropped off for awhile, probably till early fall, when they will return for their final cargoes. It is at present merely a matter of cheap Lake rates, with the leading shippers also quite aware that it is out of the question to get enough coal west of Lake Michigan by rail if the Lake docks are not well filled up during the season. The Lake fleet is so pushed for business that the coal shippers easily make their own rates and take their time in fulfilling charters.

COLUMBUS

Domestic consumers showing a disposition to stock up earlier than usual, and these grades are strong. Steam coals slower owing to high quotations on the Ohio product. Local producers still anticipate a big business in the Lake trade.

Domestic demand is the strongest feature of the trade. Dealers' stocks are generally short and they have experienced an exceptionally good call for this time of the year. Consumers are inclined to stock up earlier than usual and are only waiting for the resumption of work in the Ohio mines. Sales agents of the larger operating and shipping concerns are out in their territories taking orders for delivery as soon as possible. Dealers are selling a large amount of the fancy grades such as Pocahontas and re-screened varieties. Retail prices are firmer at the levels wich have prevailed since July 1.

There is some demand for steam grades, but users are generally getting a sufficient tonnage from West Virginia and Kentucky. Prices of these coals are lower than Ohio quotations up to date. The business depression still has its influence upon the steam trade and the consumption is not increasing very rapidly. Fine coal is rather low and some quotations on nut, pea and slack have been made as low as 50 cents.

Some help is expected in the Lake trade when coal is again produced. Although four months of the season have passed, Ohio operators are still looking to an active trade for the remainder.

Prices in the Ohio field are:

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump	$2.07	$2.40@2.55	$2.12	
Steam lump	1.87@1.92		1.97	
Egg		2.40@2.55		$4.05
Mine run	1.87	2.15@2.25	1.87	3.30
Screenings	1.57@1.62	1.85@1.95	1.57@1.67	

TOLEDO

More inquiries and an improved sentiment in the trade. Idle factories going into operation and railroads are placing orders. Status of the labor trouble.

The market is showing a strong tendency toward improvement. Inquiries are coming in more freely and orders are more frequent. Prices remain the same but some dealers report encouraging signs of greater strength. The betterment in general business conditions seems to be coming from the West and is rapidly working Eastward. The idle factories are beginning to open up and there is every indication that the plants will soon be operating as usual. Railroads are also beginning to place orders.

The mine situation is looking better and operators generally are hopeful that affairs may soon reach an amicable adjustment. This has been strengthened by the fact that the United Mine Workers of America came to the rescue of the operators against the I. W. W.'s who were causing all kinds of trouble at the mines. The United Mine Workers have acted as special deputies and largely through their assistance the pumps and fans are again working at the mines and immense waste has been prevented.

CLEVELAND

Lake shipping still further reduced and production now even less. Prices holding wonderfully firm, with only occasional important concessions reported.

Coarse coals are, if anything, a little weaker than they were a week ago, while slack is slightly stronger. This is due entirely to further curtailment of lake coal shipments, which are smaller in some instances than a week ago. During the last week the Northwestern Fuel Co. reduced shipments to such a low point that not even vessels that are under charter are needed. With each reduction the mines are forced to cut down production and surplus coarse coal must be offered on the open market. The output of slack is still further reduced and the result is a stronger market with no great demand.

Youghiogheny operators are holding out for better prices on screened coal than other districts.The bargain prices reported are mostly for tonnages that must be moved quickly. There is very little local demand for domestic fuel. Sales of Pocahontas are being reported, but largely to the Chicago market. The Western demand is keeping the market up locally.

Quotations for shipment are as follows:

	Pocahontas	Youghiogheny	Fairmont	West Va., No. 8
Lump	$3.60			
Egg	3.60			
Lump, 1¼-in.		$2.50		
Lump, ¾-in.		2.20@1.25	$2.05	$2.05@2.10
Mine-run	2.60	2.15	1.95	2.00
Nut		2.20		
Slack	2.20@2.35	1.65@1.70	1.70	1.65@1.70

CINCINNATI

Better feeling prevails although immediate business has not improved. Price concessions have ceased. Strong market anticipated this fall.

There is an improvement in the general tone of the market, due largely to the fact that coal men are able to see signs of a revival in industrial activity. So far this has not manifested itself by any marked increase in the local consumption of the steam grades, although there seems to be a general opinion that a better market is not only in sight, but is actually beginning. The trade has consequently tightened up considerably and all talk of price concessions are past.

The domestic market continues in excellent shape, partly by reason of the restricted production due to the slow steam trade, and partly because the demand is steadily improving. When the steam market revives, as is expected at any time, a period of greater activity than at any time since the early part of last winter is confidently expected.

DETROIT

Market slow and quiet, but generally firm. Shortage of labor. Heavy business anticipated this fall.

Bituminous—The local market has been slow, yet not particularly bad; steam trade has been passibly good in the city, the smaller sizes being in a little better demand and prices steadier than for several weeks past. The domestic trade has fallen off, due to the inability of the dealers to secure labor to unload the cars as a result of the heavy demand along other lines that are now starting up. Operators and shippers expect that this will make an extra heavy demand later in the season and it will tax them and the railroads to deliver coal promptly when ordered. Pocahontas has shown marked improvement this week and shippers are exceedingly well pleased with the outlook.

Anthracite—Anthracite trade was good for the month of July and shippers are now somewhat behind in filling orders for egg and stove coal. Considerable increase in orders for immediate shipment is anticipated for the first part of this month.

COKE

CONNELLSVILLE

No demand and market softer. Producers ready to make special concessions. Consumers well supplied.

The market for furnace coke has softened, there being operators so anxious to dispose of additional tonnage that they are quoting on contract about 10c. less than 10 days ago. There is no demand for coke, the present consumers being well supplied. In two or three instances August coke may have to be bought, but several consumers are covered to Sept. 1 and others through the year. In the circumstances one prominent seller has been negotiating with three or four idle furnaces on the proposition that they blow in now, with cheap coke and ore, and accumulate some pig iron. It is understood that coke would be offered for the balance of the year at $1.75. Contracts were made in May at $1.85 and $1.90, and in June three contracts, for 27,000 tons a month, were made at $2 for a particularly desirable brand. Prompt coke could easily be had at $1.75. Foundry coke is offered at $2.25@2.35 for fairly good brands, while standard brands on contract are available at $2.35@2.50 per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended July 18 at 268,200 tons, an increase of 3595 tons, and shipments at 258,762 tons, an increase of 1655 tons. Production exceeded shipments in the week by 9438 tons, according to the report, while the accumulated surplus for 17 weeks is now 52,103 tons, according to the weekly figures published.

BIRMINGHAM

This week has brought about no change in either furnace or foundry coke. Although the foundry grade is moving slowly, sales are being made only in small lots, while there is no tonnage of furnace coke being sold.

BUFFALO

No dealer has of late pretended that there was any strength to the coke market, though it is hard to say why it should lag behind coal. One shipper reports that when he orders a car it is only a day or two before he gets the car numbers; another hears from the operator that though the ovens have been shut down a month there is still plenty to ship. Quotations remain weak on the basis of $4.25 for best 72-hr. foundry and $3.25 for stock coke.

DETROIT

This product has been in fair demand within the last two weeks. Foundries that have been entirely shut down are resuming work again and some of them are actually working over-time. This has had a tendency to advance Connellsville coke on this market from $2.75 to $3, and in some cases to $3.10 for spot shipment. Solvay is now quoted at $2.25 and gas house at $2.80 f.o.b. ovens.

NEW YORK

Coke is reported somewhat steadier, with a slightly better demand. Prices are showing a rising tendency and there is a more optimistic feeling.

SOUTHERN

BIRMINGHAM

Lump coal shows very little change while shipments of steam grades are somewhat larger than last week.

The market on lump coal remains about the same. Very few orders of any size are being received and shipments show only a small tonnage for the week. Steam grades show some improvement in tonnage sold and shipped. Due to several of the railroads increasing requisitions on contracts, shipments are heavier in this line, though the small business shows little improvement. Prices are holding up well and indications point to an increased activity in the steam lines soon.

LOUISVILLE

Market somewhat improved except on the steam sizes. Prices unchanged and operations remain on a half-time basis.

Except for steam sizes the Kentucky coal market is rather active at present, having picked up considerably over the week previous, when the frequency of cancelled orders rather discouraged the operators. General rains and the fact that the farmers had practically completed their harvesting operations, stimulated the demand for domestic coals in the interior and the requirements of this market served to take up the tonnages thrown back on the operators' hands.

The Eastern Kentucky field is having the best of the business, operations and the market in the western section not having picked up to any extent. The mines generally continue to work about half time with little demand for their output. Neither East nor West is there any demand of importance for nut and slack. Prices continue virtually unchanged.

MIDDLE WESTERN

INDIANAPOLIS

Slight improvement again felt, due to crop movement and buying for winter storing. Prices unchanged but this month may show an advance.

There is a more cheerful feeling in the coal industry of Indiana. The movement of the wheat crop is effecting the trade though not making any stir. Farmers have been marketing their wheat freely and spending the money received and this has put a little more ginger into commercial and industrial lines. Factories closed for the summer are reopening here and there, more employees are being taken on at Gary, and the farm implement manufacturers report increased orders, particularly for thrashing outfits. Harvesting is also causing some additional consumption of coal and buyers of domestic grades have begun their winter storing.

All these conditions show in the trade and are bringing July orders up to their normal level. Further increases this month and next will probably cause prices to advance to or near the winter schedule and there will be an effort now to take advantage of the lower quotations. Contracts that have been hanging back are being closed and other buyers are beginning to study the price prospect for their fall and winter buying. There is a slightly better movement of steam, as well as domestic grades and screenings are still hard to get, with prices holding firm near the top. Retail business, seems to be about the average and dealers are satisfied. Car troubles are not worrying the Indiana trade yet but operators like to get as prompt shipment as possible. There is much more wheat to move this season than usual with indications of a large corn crop also.

Prices are unchanged but the current month will probably bring an advance.

CHICAGO

More satisfactory tone due to prospects of an improvement in general business conditions. Harvesting is now in full swing and farmers are beginning to buy coal. Volume of trade in the rural districts steadily increasing.

Considerable improvement has been noted in the smokeless coal trade. The announcement a short time ago that the circular price on mine-run would be advanced Aug. 1 from $1.25 to $1.40 has had a stimulating effect on buying. More of this grade has been sold within the last ten days than during the preceding six weeks, and many retailers who have been taking only a little coal on their contracts are now specifying

more heavily. Although there has been a steady demand all summer for smokeless lump and egg, it is practically off the market now. The operators have not been producing it because they have had no demand for slack and it has been impossible to produce the lump-coal even at $2 a ton.

The anthracite situation remains stationary. Retailers are short of money and this will continue until consumers begin to send in their orders.

The market is bare of Hocking coal, as the mines are not yet in production. Orders for Hocking are piling up in large numbers and when business is resumed, it is believed, it will be remarkably active for several months.

Prevailing prices in Chicago are:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Rescreened lump	$1.60		$1.65	$1.50
1¼ inch	1.50		1.50	1.50
¾-inch	1.30	$1.20	1.35	1.30
Nut	1.25		1.35	1.20
Mine-run	1.10	1.05	1.15	1.10
Nut, pea and slack	0.70		0.75	0.65
Coarse slack	0.60	0.60	0.65	0.55

Harrisburg quotations are: Domestic lump and egg, $2.40; steam lump, $2.25; mine-run, $2.15@2.25; screenings, $1.85@1.95; No. 1 nut, $2.55; No. 2 nut, $2.40.

Carterville prices are: Lump and egg, $2.40; No. 1 washed, $2.55; No. 2 washed, $2.45.

ST. LOUIS

Domestic consumers coming into the market and the situation is much steadier. Substantial advances anticipated in the next few weeks. Summer buying has been light and must be made up.

The past week has seen a growing demand from the domestic trade for the higher-grade coals, both in the city and country, and prices are advancing slightly on the steam sizes. From the high-grade field there is a tendency to decline about 5 to 10c. a ton on the screenings, and the washed market is also weak. In a way, the same conditions exist in the Standard field, with the exception that there is no increasing demand for lump coal, although the price is up perhaps 5c. per ton, with chances of going 5c. better in the next week or ten days. On the other hand, screenings have dropped from 80c. to 70c., with indications that 65c. will be reached in the course of the next week.

Retailers advise that their usual July business is away behind this year. Up to the present, not more than one-half of the tonnage usually placed for July delivery has yet been ordered, and this will mean a call for coal in August and September that will tax the capacity of the dealers to take care of.

There was a little spurt during the past week in the demand for Pennsylvania anthracite, but smokeless is still dragging and domestic coke is picking up. It is generally understood that prices on all the high-grade coals will advance on the first of the month about 10 or 15c. a ton on the domestic sizes, these prices being good until Aug. 10. The increased production of Standard lump coal will bring a surplus of screenings into the market that will cause the price on that grade to slump, at the same time forcing the price of lump up.

The present circular is:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	.....	....	$1.20	$0.80@0.85	$0.95
3-in. lump	.....	....	.....	.....	.....
6-in. lump	$1.15@ 1.35	....	1.30	0.90@1.00	1.15
Lump and egg	1.85@ 2.15	$2.00	.....	....	1.15
No. 1 nut	1.15@ 1.35	....	.....	.....	.....

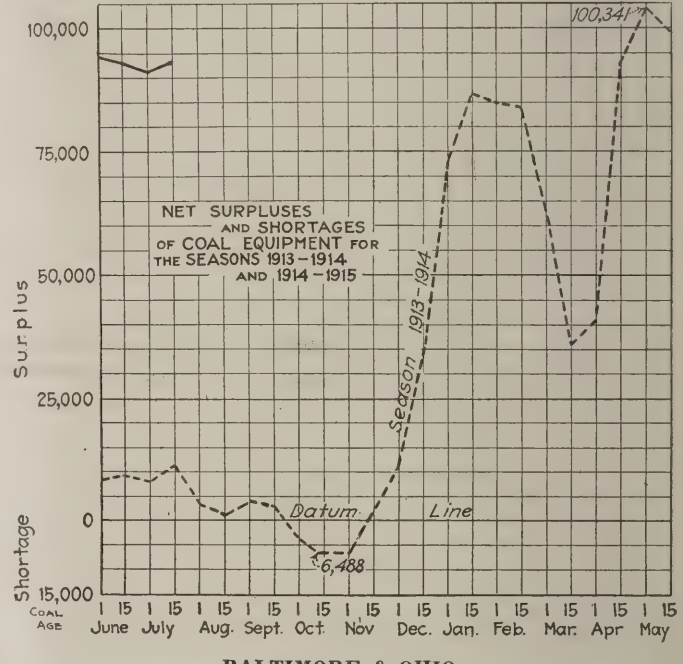
No. 2 washed nut	1.30@ 1.40	....	1.35	....	.....
No. 3 washed nut	1.20@ 1.25	....	.....	....	.....
No. 4 washed nut	1.15@ 1.25	....	.....	....	.....
No. 5 washed nut	0.65@ 0.70	....	.....	....	.....

KANSAS CITY

Conditions normal with an upward tendency as the season advances.

Business is above normal in the Southwest, the only disturbing influence at present being the strike which has tied up the Joplin & Pittsburgh railway. However, miners who live several miles from the mines have in a good many cases formed camps near their work. Demand is unusually good for the season, bookings for later delivery being brisk. The market is steady, with an upward tendency as fall approaches. A summer basis is expected to be in evidence for several weeks, however. Coal men discount the recent announcement that the Standard Oil Co. will not sell fuel oil in tank cars in Kansas City after Sept. 1.

PRODUCTION AND TRANSPORTATION STATISTICS



THE CAR SITUATION

American Ry. Association reports surpluses and shortages of coal equipment for two weeks ended July 15, as follows:

	Surplus	Shortage	Net*

FOREIGN MARKETS

GREAT BRITAIN

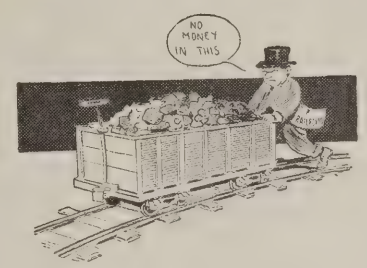
July 17—There is no change of note since last reports. Markets continue relatively weak for prompt and firm for ahead.

Approximate quotations:

Best Welsh steam	$5.04@5.28	Best Monmouthshires	$4.08
Best seconds	4.56@4.80	Seconds	3.84@3.96
Seconds	4.20@4.32	Best Cardiff smalls	2.58
Best dry coals	4.20@4.32	Seconds	2.46

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those of Monmouthshire descriptions are net f.o.b. Newport; both exclusive of wharfage, and for cash in 40 days.

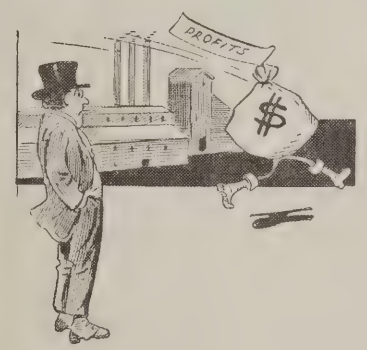
Coke is quoted at: Special foundry, $6.36@6.72; good foundry, $5.52@6; furnace, $4.92@5.28.



COAL AGE

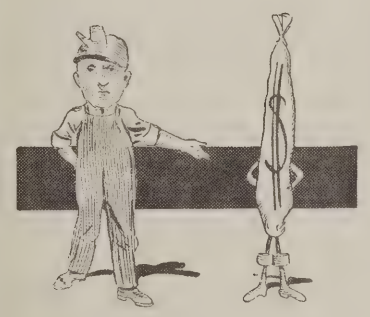
Vol. 6 NEW YORK, AUGUST 8, 1914 No. 6

Who Gets It?



By Berton Braley

Written expressly for Coal Age



Says the Ultimate Consumer, "Hully Gee!
They are certainly a-soaking it to me!
It is truly most surprising,
How my coal bill's always rising,
There is Someone coining money, I can see!"

Says the Dealer, looking worried, "On my soul!
I'M not making ANY money on my coal,
What with freight and such expenses,
I have almost lost my senses,
And I'm really going deeper in the hole!"

Says the railroad, "All this beefing is a joke,
There's no profit hauling coal or hauling coke,
And if we don't raise our rate
For this special class of freight,
In a little while we'll certainly be broke!"

Says the Operator, "Listen—on the dead,
Though I try and try I cannot get ahead,
I don't like to be repining
But the profit's gone from mining
And it's years and years since I have made a red!"

Says the Miner, "I'M no bloomin' plutocrat,
And my wages never have been very fat,
There is Someone making dough,
Out of handling coal, I know,
But you bet it isn't me, I'll swear to that!"

So we listen to that universal cry,
As they clamor, " 'Tisn't me," or " 'Tisn't I!"
There's a profit, Someone nets it,
Yet, when people ask, "Who gets it?"
There is no one who will answer, "I'm the GUY!"

Ideas and Suggestions

Highest Efficiency—How Secured and Maintained

By E. C. Northover*

Competition in the mining industry has made a byword of the term "efficiency," and has caused the mining plant to become a school of economics. It is the desire of the operator to secure and maintain a maximum output at the lowest possible cost, consistent, of course, with safety and good operation.

For the operator to secure this high degree of efficiency, it is essential that the manager or superintendent in charge shall be a man whose integrity, ability and capacity should measure up to this standard. To maintain the highest efficiency, it is important that every official at the plant should have ample opportunity to do his best.

The superintendent should manifest special interest in the way of inviting suggestions from his subordinates, such as the mine foreman, assistant foreman and fire bosses, who are naturally closer to the problems that affect the results desired. He should establish a system that would enable him to keep a fair and intelligent record of each individual, at the same time affording himself a method of determining the strength and weakness of his company organization.

A Mine Official Is Paid for Something Other Than Physical Labor

The salary or wages paid the average mine official is, as a general thing, much higher than the wages paid the most expert workman; this is due to his superior education, training and executive ability, and it is only natural that much should be expected of him that does not come through purely physical exertion. In other words, if the mine official was paid only for such actual labor as he is expected to perform, from a physical standpoint, his rating would not be much if any above that of the ordinary laborer.

Since the results of his labor, therefore, do not come through physical exertion, but more particularly through mental effort, it is evident that the manager should adopt such a system as would enable him to determine whether or not he is getting all the fruits of the inventive minds in his employ. Unless this result is being attained, the manager is not justified in believing that he is getting the highest efficiency out of his subordinates, nor, consequently, out of his plant.

I believe it good policy for the management of a coal corporation to provide some sort of a stimulus that would in a sense set up a competition between the various officials, and thereby cause them to bring to their work the best that is in them.

This could be accomplished by providing a book at each mine; the title of the book and heading of the pages should be about as follows:

Efficiency—Suggestions and Remarks

To be used by the mine foreman, assistant foreman and fire bosses.

Suggestions or remarks shall be entered, in ink, by each official at least once each month, mentioning any new suggestion or whether his district or work supervised is up to the best practicable standard of efficiency. The column on the right shall be used exclusively by the mine foreman for remarks. All reports shall be signed by the person who makes the report.

The pages should be ruled and laid out in districts. The left side of the pages would be devoted to suggestions, while the right side, as above stated, should be used exclusively by the mine foreman for remarks. A line drawn down the middle of the page would separate the space containing the suggestions from that containing the remarks; the remarks, therefore, would appear in the space directly opposite the suggestions to which they relate.

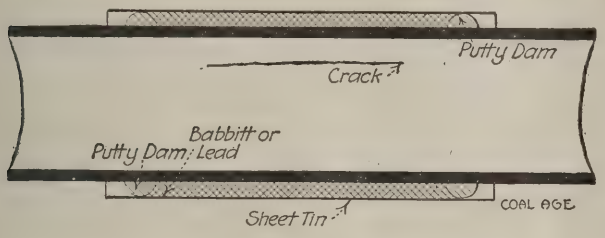
The merits of a suggestion would be decided by the mine foreman or agreed on by joint conference with the officials at the plant. A sufficient number of pages in the back of the book should be reserved and each arranged in three columns to contain a summary of all the items for the year preceding; the third column should contain the actual results as far as research or investigation could determine.

The book would be subject to the scrutiny of the superintendent, who should also affix his signature occasionally in a proper place that could be designated at the bottom of the pages. The plan may be employed to advantage at any plant, but the idea would apply more particularly to large operations where numerous assistants and fire bosses are employed.

The superintendents at some of the larger operations do make it a practice to arrange a meeting of all officials at regular intervals for the purpose of exchanging ideas and making suggestions that might increase the efficiency at the different mines, and much good has resulted from such meetings, but never have they been as fruitful as we had hoped they would. The reason for this is because all mine officials are not orators and do not possess the ability to make an interesting talk before an audience; consequently, these men are generally handicapped in making even a simple suggestion.

Among some of the most ingenious, intelligent and successful managers we can find this class of men. It has been largely through a desire to suggest a way whereby these officials may serve still more efficiently that I have been prompted to submit this letter for publication.

*Johnstown, Penn.



When buying retort-oven coke, it is advisable to stipulate that coking shall have been continuous for 24 hours, for often where the recovery of the byproduct is of more importance than the coke the ovens are drawn at a point of greatest economy, sometimes on as short a time as 14 or 15 hours, which produces poor coke.

Mending a Cracked or Broken Pipe

By M. G. Near

A quick and satisfactory way to mend a cracked or broken pipe, provided it is not subjected to too high a temperature or pressure, is to proceed as indicated in the accompanying sketch.

Make a couple of rings of putty around the pipe, one on each side of the crack. Wrap a piece of thin sheet tin

Cross-Section of Pipe, Mold and Babbitt Casing

around, being sure that there are no openings between the tin and putty for leakage of lead. Leave the opening on top. Pour in the lead or babbitt. After this soft metal is hardened, the mold is easily removed.

On cooling, soft metal like this usually contracts, thus drawing itself tightly around the pipe and making the repair secure.

Fire Prevention

The following excellent safety rules for fire prevention are taken from the Inland Steel Co.'s Book of Rules:

(1) Maintain order and cleanliness. Many fires are due to untidy conditions. Inspect premises daily and do not allow empty boxes, barrels, waste, etc., to accumulate, but dispose of them promptly.

(2) Ashes should never be emptied into other than metal receptacles, and should be kept away from frame buildings, etc.

(3) Oily waste, etc., oxidizes rapidly and should not be allowed to lie around, as spontaneous combustion may occur.

(4) Sawdust and other combustible material should not be used to catch oil drippings, or be placed in cuspidors. Use sand placed in metal pans.

(5) Wherever practicable, soap solution should be used as lubrication for cutting tools instead of oil.

(6) Use safety matches instead of parlor matches, as the heads of the latter often fly off when igniting.

(7) Kerosene lamps, lanterns, torches, etc., should be filled by daylight only, and never filled while burning.

(8) Do not allow incandescent lights to rest on combustible material, or anything combustible to be hung on electric lights. Paper shades should not be used. Extension lights having long wires which are hooked over rails, etc., are dangerous, as insulation is liable to wear off and cause short-circuiting.

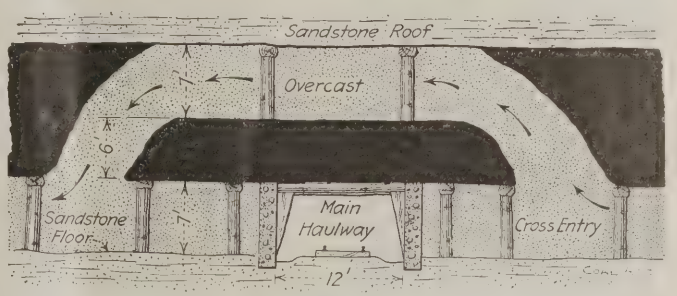
(9) Never replace blown-out fuses with wire.

(10) Stove pipes should not be run through floors or partitions. Provide a chimney. Floors and woodwork near stoves should be protected by metal, brick or cement.

(11) Inspect chimneys at regular intervals and repair defects.

(12) So far as possible fireproof materials should be used in all construction work.

(13) Lumber piles, etc., in dry summer weather should be kept wet.



Overcasts in Thick Coal

Special Correspondence

A point of considerable interest in the working of a thick seam of coal is the advantage that may be taken of the thickness of the seam, in the matter of driving overcasts to conduct the air current across main roads.

The accompanying sketch illustrates the form of overcasts in use at the Black Hawk Coal Co.'s mine at Black Hawk, Utah. At the time the mine was opened, "Economy first" was the cry, instead of "Safety first," and this type of overcast was the result of the effort to *economize,* in every way possible, in the operation of the mine. It was the thickness of the coal seam, which in this case was 20 ft., that made this form of overcast possible. The coal is a hard, bituminous character, very cohesive, and has no pronounced face or butt cleats. This seam has a sandstone roof and floor.

In the working of the seam it has been customary to drive the entries 7 ft. high, leaving about 13 ft. of top coal, which is taken down in the rooms. It is readily seen that these conditions make it possible to drive an

General Style of Overcast in Use at a Utah Mine

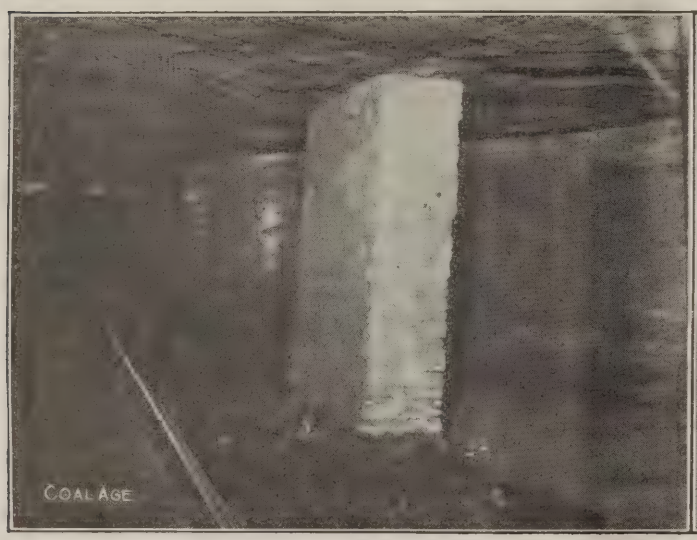
overcast in the solid coal, as shown in the sketch, and that the adoption of this method of overcasting the air greatly reduced the cost as compared with the modern reinforced-concrete overcast. It was only necessary to build two concrete walls for stoppings, in the cross entries, on each side of the haulage road. The driving of the overcast represented only about 8 or 10 yd. of extra narrow work. This form of overcast presented the additional advantage of leaking less air and being more permanent.

In the working of the rooms in this mine the percentage of coal recovered in the first working is comparatively very small, as the rooms are driven up narrow, large pillars being left between them. The major portion of the coal in this seam is taken out in the second working, on the retreating system.

A good hoisting brake should be able to hold the loaded cage at any point in the shaft without the application of the pressure of steam against the engine. To give the best results hoisting brakes should act directly on the drum, for in case of accident to the engine, the brake on the drum will be able to control the loaded cage.

Substitutes for Wood Timbering in Mine Operations

By Howard I. Smith



SYNOPSIS—Some notes and comments on the trend of conditions in the practice of mine timbering. The steady depletion of our forest reserves and a like increase in the requirements for mine timbers are rapidly forcing the issue to a head. Reforestation and preservation of the timber are coming into more common use, while steel and concrete substitutes are receiving a careful consideration.

In has been the practice from earliest times, in the mining of coal, ore or rock, to oppose the resulting pressure from the roof or sides of the excavated area by various types of wooden supports, such as props, timber sets, cribs, etc. Under certain conditions, pillars of coal, ore or rock are used in place of the wooden supports. This refers, of course, to excavations in ground that is not self-supporting.

In many places throughout the United States it is still the practice to leave pillars as permanent supports. However, on account of the value of the coal or ore, it has become the practice in many districts to remove these pillars as far as possible. This, together with the increase in mining operations, has created a greater demand for artificial roof supports. The result has been that the rapidly disappearing forests are now being depleted even more rapidly than in former years.

Until recent years no successful attempt has been made in the United States to introduce mine supports other than wood, as this has been the cheapest material available. Wood can be readily cut to meet the varying mining requirements, in many cases by an ordinary laborer equipped with a saw or handax. When loaded beyond its capacity, the resulting straining or cracking serves as a warning to the miner.

No longer can the mine operators send their timbermen to the woods surrounding the mine openings for their props. The incerase in the cost of mining, due to the ever increasing cost of timber, is a problem that has necessitated a great deal of study. The need of more systematic timbering has been discussed in many papers on accidents due to fall of roof and coal, on maximum recovery of coal, etc. While no direct remedy has been suggested, that could be adapted to all conditions, there can be no doubt but that much further relief will be afforded by continued work and study along the following lines: Reforestation, reducing loss by decay, timber economy in mines, adopting methods of mining which reduce the timber consumption for maximum recovery of coal, substituting other materials for wood.

Masonry Wall Laid in Mortar

Typical Application of Concrete to Mine Portals

Reforestation

To indicate what is being done to meet the ever increasing demand upon the forests of Pennsylvania, I have taken some figures from the address of Henry Drinker, president of the American Forestry Association, published in the *American Forester* for March, 1912.

Pennsylvania has a Department of Forestry, with a commissioner and a deputy commissioner; also a State Forestry Reservation Commission. It has the second largest state forest reserve in the United States (about 1,000,000 acres), with provision for the purchase of land not exceeding $5 per acre. There is a fine protective system. The state has taken the lead in the campaign against the spread of the chestnut blight by its generous appropriation of $275,000 for the work, and the effective measures taken thereunder. There is also under consideration the enactment of legislation taxing timber land at a small rate per acre, and there is one college and an academy in the state giving courses in forestry.

H. S. Graves, the United States Forester, gives full information of the splendid work being done by the U. S. Forest Service in his report for 1912. The report shows that on June 30 the national forest reserves covered a

Note—Paper read before Coal Mining Institute of America, Monongahela, Penn., June 16, 1914.

total of 187,406,376 acres. These contain a total of 600,000,000,000 ft. of merchantable timber.

It may be interesting to note that among the private interests engaged in the practice of forestry in 1911, the U. S. Department of Forestry reports ten coal companies with acreage distributed as follows: Ohio, 34,510 acres; Indiana, 100 acres; New York, 10,000 acres, and Pennsylvania, 43,308 acres, a total of 87,918 acres. Another company having both coal and railroad interests has 100,000 acres in addition to the above; this has no doubt been increased in the last three years.

Reducing Loss by Decay

The reports of the U. S. Department of Agriculture set forth that 45 per cent. of timber taken into the mines, decays. This statement has been given wide publicity in various periodicals. To reduce this large percentage of loss, several methods have been adopted. The simplest expedients are to peal the timber before use, and to use judgment as to when it should be cut. Timber cut during the summer months decays much more rapidly than that cut during the winter. Loblolly pines cut during the summer have been observed to show the first evidence of decay within six to eight weeks.[1] Timber after reaching the mine has been given the brush treatment with whitewash, cheap paint, creosote or carbolineum with effective and economical results. Timber has also been treated with creosote and zinc chloride at an additional cost of 20 and 12 per cent., respectively, with the result that its life has already been increased 300 per cent., and it is still in good condition.[2]

Several large coal-mining companies have found it necessary to install plants for the treatment of timber for use in mines. Treated timber would come into more general use if it could be more readily bought in the open market. The preserved timber on first thought, could be used to advantage only where permanent timbers are desired, but this is not necessarily true. Timber which is to be kept in the mine for one year would be of more value if treated, for this may be taken as the life of mine-timber in any except the best of atmospheric conditions. This time limit may seem rather low, but one would seldom reuse a timber after it had been under ground for a year; it may still look strong, but it has lost a great deal of its vitality.

One of the accompanying figures shows timber that has stood for 25 years. These timbers, at first glance, appeared to be in an excellent state of preservation (not a single prop had fallen out), although upon careful examination it was found that a penknife could easily be buried to the hilt in any of them. These props had been split from the center of white oak trees and contained little or no sap wood. Manifestly, there was no weight on these timbers, the roof being supported by the adjacent pillars.

The use of mine timber preserved with creosote or other oils has frequently been condemned on the ground that they increase the inflammability of the wood. Again, in case of fire, the irritating effect of the smoke produced is great. Some European experimenters claim that only a few drops of such preservatives, when burned in a room, make respiration impossible. I am advised by the superintendent of a preservation plant of one of the railroads that after treated timber has stood for two or three months it becomes very difficult to ignite it.

The necessity for protecting timber from the weather, the proper time to season and other interesting features are well illustrated and described in a paper by E. E. Ruter, Coal Age, Feb. 21, 1914, page 331.

Apparently Good Timber Rotted through

An Excellent Condition Where Pointed Posts Could Be Used

Timber Economy in Mines

Timber economy may be attempted in two ways: By the use of a portable sawmill to utilize broken or otherwise worthless timber, and by dressing the timber to most economical proportions and shapes.

Portable sawmills have been installed by a number of mining companies for the purpose of sawing up broken timbers and odd lengths into sprags, caps, lagging, and even into lumber. One company using a portable sawmill reports a large saving, which would make it appear that the amount of broken timber and odd lengths being

[1] Penna. Mine Inspector's Report—1912. Part I. Page 20.
[2] Penna. Mine Inspector's Report—1912. Part I. Page 20.

covered up daily in the many mines of our country is an appreciable item.

Decrease in the first cost of timber may be accomplished by reducing the freight bills. This may be done: (a) By removing the bark as soon as the timber is cut and allowing the water to dry out. At the same time this gives the timber a better opportunity to season, which adds strength and retards decay; (b) by slabbing the timbers where cut, thus eliminating the transportation of a large tonnage. The Department of Agriculture reports that slabbing a prop tends to increase its unit strength, probably the effect of improving its straightness. Conclusive results could be obtained only by comparing materials cut in the same area. The unit strength of a round post is much stronger than the same post split; likewise, the unit strength of round timbers used for beams is much less than when the beam is sawed in the correct proportions of height to breadth to give the best unit strength design.

Under favorable conditions of roof and floor, props may be made more serviceable, and at a considerable saving, by sharpening one end in the form of a wedge, or to a point, so that the prop will yield somewhat before the elastic limit has been reached. The results of some tests published by Emil Stens in *Gluckauf*, Apr. 29, 1911, are given in the following table. The props consisted of straight pine 10 c.m. (3.94 in.) in diameter and 1.4 m. (55.12 in.) long. Five props were used for each test:

		Pressure (Tons)	Compression (%)
1.	Props fastened at upper and lower end...	15.1	0.31
2.	Prop with a 4-in. wedge shaped cap on top	16.3	5.2
3.	Props with 4-in. wedge on both ends.....	14.1	8.7
4.	Prop with a 4-in. wedge shaped cap on top and beveled at bottom; length of bevel 1.5 times the diameter.....	16.8	17.5
5.	Same with bevel three times the diameter	15.3	18.2

The results of these tests show the yielding capacity of props can be increased from 0.3 per cent. to 18.2 per cent. without decreasing the carrying capacity of the timber. On account of the varying grain in the wood, it is always best to toe the bottom of the prop into the ground one or two inches. The best results are obtained by using a cap piece with some sap wood; this, being soft, allows the prop to adjust itself to more even pressures.

W. H. Hepplewhite, who was among the first to try out the pointed or tapered prop, conducted a test on props 6 ft. long and 6 in. in diameter with a 15-in. taper. At 15 tons, the prop began to blur out at the bottom, and at a pressure of 34 tons the prop began to buckle in the middle. This allowed a roof depression of 15 in. without damage to the bulk of the prop, whereas a prop with square ends would have broken and become useless when the roof had come down about 2 in. The former prop could have been redrawn and reset; the latter could not. Men using axes to cut their props instead of saws can taper a prop with a loss of but little time.

The use of pointed props for gob timbers is well worth serious consideration where the pillars are under considerable pressure and the floor is medium hard. A floor of this kind is shown in the accompanying figure, the cross-bar in this picture being level. This same effect is produced in a minor way by placing the wooden prop on a pile of soft dirt, but this does not seem so practicable since the compression at first is very rapid at low pressure and then quickly changes to a very slow rate of compression. Ideal places for the use of pointed or yielding props are shown in two of the accompanying figures.

TYPICAL HAND STOWING USED AS A ROOF SUPPORT

DRY WALL BUILT UP IN THE FORM OF A PIER

ADOPTING METHODS OF MINING WHICH REDUCE THE TIMBER CONSUMPTION FOR MAXIMUM RECOVERY OF COAL

The timbering problem is so closely related to mining methods that this phase must be considered sooner or later. The methods which undoubtedly give the least trouble from falls of roof are the strippings of Kansas or eastern Pennsylvania, about which we recently have had an opportunity to read so much. Beginning with this method, timber consumption increases until we consider the caving methods, which are undoubtedly among the greatest consumers of timber. Among other methods we can compare the room-and-pillar system, where so often no attempt is made to recover timber, and with the longwall method, where a large part of the timber is recovered.

In a class by itself is the system of hydraulic filling. Here the first excavations are filled or partly filled with loose material, which in time acts as a pillar to support

the roof while the coal is being removed; this will support the roof and stop squeezes where all other known methods have failed. I have observed pillars being extracted with the use of very little timber where a squeeze had heaved the bottom of an old entry tight up against the roof, which was almost entirely supporting it while the coal was being removed.

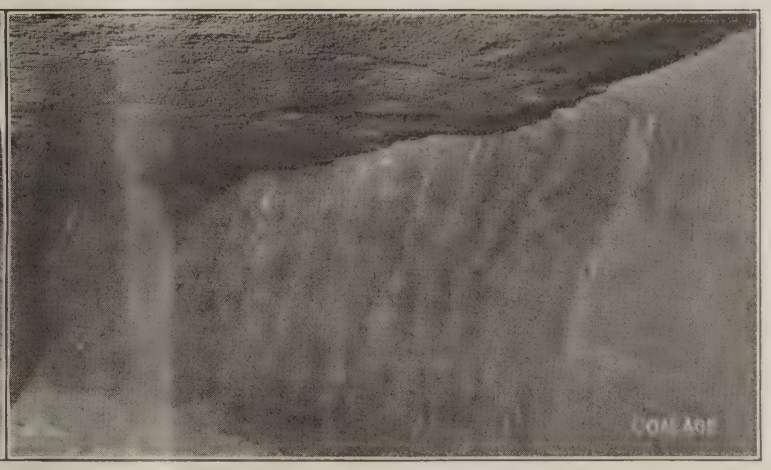
Substitutes for Wood

After the adoption of such of the preceding methods as may be practical, the mining industry may still be in need of more permanent, substantial or more economical mine props, especially as our mines become deeper and extend over more area, and where a large percentage of the coal is to be extracted. With this in view, we may consider what has already been done in securing substitutes for wood.

First, hydraulic filling; this has been of the greatest economic value from the standpoint of recovery of coal and saving of wood. No attempt will be made here to discuss the many phases of this important subject. The accompany figure shows the culm standing in a straight wall, requiring no lateral support, while the coal is being extracted.

Second, hand stowing of waste materials from the mine either along the main passages or in the working place or as pack walls in longwall work. A pack wall in an Illinois mine is shown in an accompanying figure.

Third, the building of piers or columns with mine rock without the use of cementing material, as shown in an accompanying illustration. Piers of this type when compressed about 30 per cent. will carry a load about equal to what coal will stand in the pillar. A pier of this type is very serviceable and costs about $1.25 per cu.yd. for construction.



Fourth, the use of well constructed concrete, brick or stone piers or walls, either alone or in conjunction with steel or wood beams. A stone pier used at the junction of a butt entry aircourse and the face entry is shown herewith. Supports of this construction must be considered as perfectly rigid and are used to prevent the roof from bending and subsequently falling. After weight has been supplied to a support of this type greater than its compression strength it is of no more value. It is unlike a support of similar material which has been built without mortar, the latter having a greater supporting value with the increase in the compression.

The use of concrete or masonry arches and walls with steel beams are gradually eliminating the old-time prop with brush lagging, and the later use of large and more permanent timbering for mine portals, shaft bottoms, underground stables, pump houses and other similar places where it is very important that there will be no delays due to a fall of roof. In one mine recently visited approximately one mile of concrete and brick-lined entry had been installed. One of the accompanying figures shows the use of concrete for mine portals, steel ties imbedded in a concrete floor and a steel tipple.

A concrete or masonry wall built along the haulageway to support the cross beams not only acts as lagging, but should a trip of cars become badly wrecked there is no danger of the end supports of the cross-bars becoming dislodged and allowing the roof to fall. Where concrete or brick piers for end supports of beams are to be built, advantage should be taken of this practice and the wall built up solid to the top of the car. The pier for the beams may then be built on top of the wall.

Where Pointed Props Might Have Been Used to Advantage

Example of Culm Filling in the Anthracite Regions

Fifth, steel sets are frequently used in place of wood on important haulage or airways as a permanent mine roof support. Discussions on this phase of timbering have been so thoroughly covered in papers read before this institute by R. B. Woodworth, of the Carnegie Steel Co., and in later papers by him, in which he keeps this important topic uptodate and constantly before the attention of mining men, that it would be folly for me to attempt a lengthy discussion of this subject without the use of quotation marks.

Among the more important installations of steel timber sets, the Carnegie Steel Co. gives the names of 50 companies that are using steel in gangways and entries, pump houses, underground stables, etc. A complete list would probably include nearly all the large companies of the United States.

The first cost of steel timber, erected, is usually two to three times that of wood, but this is usually warranted by the increased life and the large expense sometimes necessary to clean up a fall. Another very important consideration is the reduced output caused by blocking a haulageway. One of the accompanying figures illustrates what often happens in case of a cave. This pic-

ture was taken after a test in the experimental mine of the Bureau of Mines at Bruceton, Penn. A very interesting comparison, showing the advantages of steel I-beams over steel rails, white oak, chestnut and white pine, is given in an article by A. W. Hess, COAL AGE, Feb. 28, 1914. One of the points brought out is that a 4-in. I-beam will do the work of an 8-in. round timber.

Sixth, the use of steel or iron props at the face. This practice is possible only where all the props can be recovered, or in that portion of the mine where it is possible to recover the props before they have become overstrained to such an extent that they must be straightened, repaired or sold for scrap.

Props are made to serve either one of two general purposes. The first type is the rigid prop, which fails upon a compression of a very small per cent. Such props are used to keep the roof in place and prevent it from starting, for instance, in the case of a tender shale above a flexible roof coal, the use of the rigid prop being to hold the roof coal up against the shale. The second type of prop is used to support the immediate roof where its movement is practically irresistible. This type of steel prop can be made yielding only in combination with wood or by allowing a part of the prop to rest in a cavity filled with peat or other loose materials. The yielding steel prop is probably used in Germany more than any other country.

In either case, the type of steel prop giving the best results from a structural standpoint is the pipe. This has been tried in the anthracite region where great supporting power was necessary. The pipe was cut to length and a flange placed on both ends to increase the bearing surface. Scrap pipes from old culm lines have been used in stables and such places after filling the pipe with concrete.

The most economical design of steel to withstand compression is the "H" section beam, where the radius of gyration is nearly equal about both axes. This design has been used in England since about 1890 and is now quite common. It has also found a market in the anthracite district to a limited extent. The chief drawback in both the pipe and "H" section is the inability to readily change the length to suit conditions. This has been overcome in several different ways.

A most ingenious design of a roof support is in the form of a pipe with a screw jack head; this was used in a bituminous mine of Pennsylvania about 1906 (see accompanying figure). These props were made to protect a coal conveyor in longwall work, but they would also be of advantage in many mines as temporary props under draw-slate, or for protection in taking down bad roof.

Another form of adjustable prop, manufactured by Herman Schwarz, of Essen, Germany, consists of a channel bar with a T-beam telescoping into the channel; the lower end of the beam is slightly wedge-shaped. The beam contains horizontal slots and it is raised to the proper height, then forced against the roof by iron wedges driven into slots and resting on the band on top of the channel bar. A wood wedge is then driven in between a movable ring and the wedge-shaped end of the T-beam. The iron wedges through the beam are then removed and used at the next post. An oval-shaped bolt is provided for use on the back side of the channel. When it is desired to remove the prop this bolt is given a one-quarter turn, which brings it to the flat side of the bolt and loosens the wood wedge on the front of the channel and allows the prop to collapse. The compression of the wedge allows the props to yield at a load of 15 tons, which is regulated somewhat by the kind of wood used for the wedge. This prop has found use in both Germany and Belgium.

The Mannesmann Mildless Steel prop consists of two pipes, one telescoping into the other so that they can be adjusted to the proper height. They are held in position by a clamp which is attached on the outside of the prop in such a manner that it cannot slide down. It is claimed that the clamp can be screwed to a resisting force of 15 tons, after which time the telescoping will proceed as that weight is being applied. Good results have been obtained by using these at gate ends and to the first waste conjointly with tapered props. These props, as the ones above, can be easily removed from a distance.

"JACK" USED AS A TEMPORARY SUPPORT

CONCLUSIONS

One of the most important means of obtaining economy in the use of props is to provide a method of mining whereby a maximum amount of timber may be recovered. While this change is being made, attention should be directed to more economical utilization of the timber now available and to increase the wood supply. The latter must be done by reforestation; the former by preventing loss due to decay, cutting beams so as to have the greatest unit-bearing value and pointing the props so they will yield to compression slightly under the breaking load.

Concrete, stone and brick piers and walls have proved

desirable, especially where steel beams are to be supported, but they are not recommended for permanent supports to withstand great pressure. These three materials are also used to great advantage for mine portals, shaft bottoms, underground offices, stables and pump houses. Dry pack walls or piers and hydraulic filling are the successful supports to irresistible pressures. The use of steel sets has been firmly established in the United States, and they are giving satisfaction both with regard to cost and efficiency. The use of cast-iron props has given way to later designs in steel. Steel props are gradually becoming more extensively used abroad, and before long we can look for their general adoption in the mines here.

Results of 48 Tests

The investigation of mine roof supports has been started by the Bureau of Mines for the purpose of determining what are the best materials to use for supporting the roof and how these different materials and appliances act under load. Forty-eight tests were made in coöperation with the Pennsylvania State Anthracite Mine Cave Commission during January, 1913. These tests and others made later, supplementing that work, are as follows:

Heavy Fall Blocking the Haulageway

Four tests were made to determine the bearing value of props placed in a vertical position.

Four tests were made on dry rubble masonry to determine the unit-bearing value at different percentages of compression.

Five tests were made to determine the unit bearing value at various percentages of compression on loading yellow pine, oak and spruce cogs unfilled and filled with loose mine rock.

Two tests were made to determine the unit bearing value at different percentages of compression for square mine rock cogs laid up in cement mortar, the interior hydraulically filled with culm, sand and ashes.

Seven tests were made to determine the unit bearing value at various percentages of compression of sand and anthracite ashes equal parts, broken mine rock and breaker refuse passing through 1½-in. screen. Placed in steel cylinders.

Twenty-one tests on concrete of various mixtures of sand, sand and gravel, anthracite ashes, sand and breaker refuse, sand and broken mine rock and culm to determine the unit bearing value. The first set of seven was tested at the age of seven days, second set at 34 days and the third set at 96 days.

Five tests consisting of loading reinforced concrete columns and brick piers to determine the unit bearing value at maximum load. These tests were constructed and tested by the U. S. Bureau of Standards and the results given to the Anthracite Mine Cave Commission.

One test was made on a support designed by George S. Rice. It consisted of a concrete cylinder filled with mine rock and sand. The object was to determine the advisability of using such a design around gas or oil wells. This type may be used to great advantage for a pack wall along haulageways in longwall work, in arresting a squeeze or in supporting valuable improved property on the surface.

Three tests were made on concrete blocks to determine the advisability of their use under valuable surface improvements.

Twenty-one tests were made on loosely packed materials from the anthracite region to obtain a comparison between the different materials when subjected to loads.

Eighty-four tests were made to determine the compressibility of different materials from the anthracite region that are available for dry and hydraulic filling.

Fifteen tests were made to determine the effect of settlement of the above materials due to shaking, spading and tamping.

Seventeen tests were made on bituminous coals from the experimental mine.

All of these tests were made to determine what different uses materials around the mines may be economically put to for the purpose of supporting the roof while getting out all the coal and at the same time causing as little damage to surface property as possible. Some of these tests were made on wood for the purpose of getting a comparison between the materials used and some material with which we are already familiar.

In Bulletin No. 25 of the U. S. Bureau of Mines are the results of 15 tests conducted under the direction of Messrs. Griffith and Conner, and in the appendix are the results of 416 tests on anthracite coal made for the Scranton Engineers' Club, in 1900.

With the exception of the latter, which is very complete, these tests must be considered only as a preliminary investigation, and each branch must be continued to duplicate the tests conducted before the results can be accepted as authentic.

In furthering these tests a large amount of work has been outlined, including tests on concrete and steel props, not so much to determine their strength as to determine their behavior and what is the best type that can be adapted to mining practices.

The best method of splicing differently layed ropes is to open the six strands of the long-layed rope to the full length of the intended splice, then open the six strands of the shorter-layed rope for about a yard, join the ropes to form a long and short strand. Then lay the long-layed strands into the place of the short-layed ones, then run the ends in, being sure to lap the strands that run inside for their full length, with a piece of string, so that the strands will be the same size as that taken from the middle of the rope. This method prevents the twisting out of splices and allows the splicing of any two different sizes of ropes together by means of laying the big rope into the smaller one.

Sanitation and Simple Ways of Making It Effective

By Dr. R. D. Roller, Jr.*

SYNOPSIS—The first step toward sanitation is fences. Water, sewage, garbage disposal, disinfection and the proper diligence in stable cleaning are all necessary to secure the health and efficiency of the individual workers.

Medicine is drawing nearer each day to its ideal—the prevention of disease—and sanitation is one of the great cornerstones on which prophylaxis is built. As prevention of disease is of more importance than the cure, so it is of more importance to keep a man's working ability at par, than to try to build it up after it has declined.

Sanitation and efficiency go hand in hand. The man who has a child at home, in bed with typhoid fever contracted from flies or bad water, cannot be 100 per cent. efficient at his work. The man who has to sleep with the odors of a pigpen in his room, with flies from the garbage pile swarming about him, with mosquitoes from a stagnant pool of water singing around his head, is not 100 per cent. efficient. These are a few of the things that sanitation takes note of, and, while striving to prevent disease, at the same time seeks to increase human productiveness.

The incorporated town superintends its own sanitation, however well or badly this may be done, but the mining town is under direct control of the mining company, and must depend upon that company for its sanitation, So, aside from the fact that sanitation makes for efficiency, and, therefore, that it "pays," it is also a moral obligation which should be assumed voluntarily and cheerfully.

I think the start in sanitation should be made with a hobby, a hobby that is so practical that it seems to be indisputable. This hobby is called "fences." Each house should be fenced.

This should be done when the house is built, so that the cost will not seem burdensome. Each yard must be cleaned of rubbish before occupancy and what is of more importance, each tenant must be told that that yard must positively be kept in that condition.

A sidewalk should be laid in front of the houses and the roads be kept passable. In summer no water should be allowed to stand in the roads and all holes should be carefully filled. These are places for the breeding of flies and mosquitoes, and, though malaria is not prevalent in West Virginia, still the mosquito is an annoying and useless insect.

Pigs Should Be Isolated

Pigs should not be allowed to roam at large, and none should be kept near any dwelling; certain parts of the property, at a distance from the houses, varying with the circumstances, can be allotted to those who wish to keep them.

Enclosures for chickens should be fenced, but these, of course, can be at the rear of the houses.

The closet is the greatest difficulty with which we have to contend. There are many ways of arranging these, from buckets which are to be removed every week, to pits which are deep enough to be practically permanent. The bucket is good, but the constant cost of removal eventually becomes a source of irritation and often neglect follows, resulting in the very condition which it is sought to avoid.

The best, cheapest and most satisfactory method is the old-fashioned pit. This should be dug 5 to 6 ft. deep. The sides should be lined with 1-in. plank to prevent caving. These should project a few inches above the surface with a strip of board nailed across their ends, practically forming a foundation.

The house should be small and light. A mistake is often made in making it so large and cumbersome that it is hard to handle. It should be built independently of the foundation, but should be fastended to it securely, and in such a manner that all light is excluded. No windows should be put in the house, but if thought necessary for ventilation, small holes can be cut near the eaves and covered with wire screening.

The door should have a spring and be thus kept closed at all times. In this way the pit is kept in darkness and is no longer a breeding place for flies. Nor can flies lodge here and board in the kitchen, a condition which too frequently exists.

The pits should be treated with crude carbolic acid, at least once every two weeks, and a supply of lime should be kept in the house for the convenience of the user. Once a year the house can be removed and the pit cleaned, or when it becomes too full it can be covered with earth and a new one made nearby.

A unique scheme has been used by one coal company, which is as effective as it is cleanly. A 10- or 12-in. pipe was laid under 20 or more houses, with an opening under each house. A nearby stream was diverted into the pipe, flushing it continually, thus answering all the purposes of a sewer without its expense.

I would like to have a plan I have had in mind for some years tried. The same general arrangement of pipes may be used, but should be connected to a common sewer. These pipes should be flushed automatically once a day from a tank built for that purpose. The sewer can be discharged into a river or large stream, or, lacking that, several large cesspools could be dug, or a septic tank might be used. I believe that this is an ideal system where the water supply is abundant.

Careful Garbage Disposal Is Important

The question of garbage disposal is a second serious matter. A box, made of wood, or, preferably, galvanized iron with a tight lid, should be placed for each house. It is better to use these boxes if possible for ashes, tin cans and other dry rubbish and have the tenants put their slop in covered buckets. This slop can be collected in a separate compartment or in a large covered box that can be carried in the garbage wagon.

By a special arrangement with the driver, the owners of pigs can have the slop hauled to their pens and thus

*Eccles, W. Va.

Note—Abstract from a paper read before the West Virginia Coal Mining Institute, at Cumberland Md., June 3, 1914.

make use of it to a considerable extent. A place should be selected in a secluded spot for the disposal of the rubbish and all slop not fed to pigs should be buried or burned.

A garbage box without a bottom has been used with success in some places. I believe it has the advantage of not getting dirty and foul smelling so quickly, and there is less danger of scattering the garbage when collected. The box can be easily turned on its side, the garbage shoveled up, and lime sprinkled on the ground before replacing the container. If, for any reason, water gets into the box, it drains out readily and does not make such a bad mess of débris to handle.

Every precaution must be taken by the driver to prevent the scattering of rubbish on the ground.

A rigid rule must be enforced requiring cleanliness and prohibiting the throwing of trash about yards, and upon any violation the latter should be cleaned and the cost charged to the tenants. This acts as a punitive measure, but is at the same time just and fair to all.

It will be of great advantage and soon pay the difference in cost to get a good man, who is thoroughly reliable and has some tact, to drive the wagon. The difference that 25c. a day makes will be recognizable in the amount and quality of the work done. Rounds must be made as often as necessary; once a week, at least.

The water supply must be given full consideration. A system of pure water should be furnished and hydrants placed at convenient points, if not at every house. After a central system is installed and water obtained from one large source there is not great danger of contamination, but if wells are used, an examination should be made frequently to see that no contamination has taken place.

Around each hydrant a base of concrete should be built to prevent washing of the earth and standing water. It would be best if a drain be put in and the water carried at least away from the roads and yards.

Before deciding upon the water that is to be used, a thorough bacteriological examination of any springs that are in use should be made for contamination, and any not absolutely pure should be sealed up.

The camp officer should be made the special sanitary officer provided the company is not large enough to afford the employment of a man for that special purpose. He should make a thorough inspection of the town at least once a month and report any conditions that need correction, calling special attention to flagrant violations of any rule.

Most People Like to Be Clean

The great majority of people like clean homes and surroundings, even though they do not realize it. They should be encouraged in keeping their premises in good condition. They should be assisted in making gardens. Front yards should have grass and flowers and back yards should produce vegetables.

In the same enclosure, one cannot have chickens and flowers, nor pigs and vegetables, and no garden can exist in a yard littered with garbage, ashes and old tin cans.

The children must be brought into any scheme of improvement and their cöoperation secured. The best place to teach them is in the school, and the teachers should be asked to give their aid by talking to the children a short time each week on general sanitation, and what it means.

Insistence must be made upon the fact that clean surroundings with a dirty house are unthinkable and every effort must be made to have clean homes within as well as without.

One great asset toward cleanliness is a central bath house. At each mine a bath house should be built with a system of lockers, each made of steel and well ventilated. There should be one locker for each man and a small rental can be charged for its use.

Adjoining this locker room, but not in it, showers should be built with concrete floors. These, of course, must be supplied with hot and cold water. Perfect ventilation must be provided, and when heated in the winter, care must be taken that the air in the locker room does not become too humid.

There are times when disinfection of a house becomes necessary even when there are no so called contagious diseases. A friend of mine told me of a mining camp, of which he had recently taken charge, in which there was such a prevalence of tuberculosis as to almost approach an epidemic. This called for disinfection of all houses, in which there were active tubercular patients or in which any had died recently, as thorough as after a release of a scarlet-fever patient. This is a point frequently overlooked.

The Care and Disinfection of Stables

In view of the fact that it is thought highly probable that infantile paralysis is transmitted by the fly, care should be taken to destroy all breeding places of this insect around the stable. Manure should be kept in a dark place and covered if possible. Kerosene poured on it will destroy the larvæ. The stable itself should be kept clean and occasionally disinfected by burning sulphur, after it has been tightly closed.

I would also like to suggest that that part of the store where meat is sold should be screened. One of the best ways to do this is to screen the counters, leaving small openings, with self-closing doors, through which the packages may be passed.

There has been a great deal discovered in the last few years in regard to hookworm, and its connection with so called laziness. I have found two or three cases in my practice. This disease exists practically everywhere south of the Potomac River, and though found more frequently among the country people, I believe it will develop to some extent among miners and others.

Hookworm ova develop in temperatures ranging from 77° to 95° F., but they have been known to mature in mines at a uniform temperature of 68° F. Lower than this there is probably no development of the ovum.

Infection occurs most frequently through the skin. For this reason country children are most liable to infection, as fecal matter is here more frequently scattered over the ground, the children getting the larvæ on their feet.

Hookworm causes symptoms varying from lassitude to complete debility. Where many men are infected there is a great decrease in the amount of work done by a given number and many more must be employed. I wish it were possible to give definite statistics; these, however, will be secured in the near future. And in the meantime, it will be well for the operator to bear in mind, and carefully consider, that the day may come when fighting the hookworm will be a part of mining sanitation.

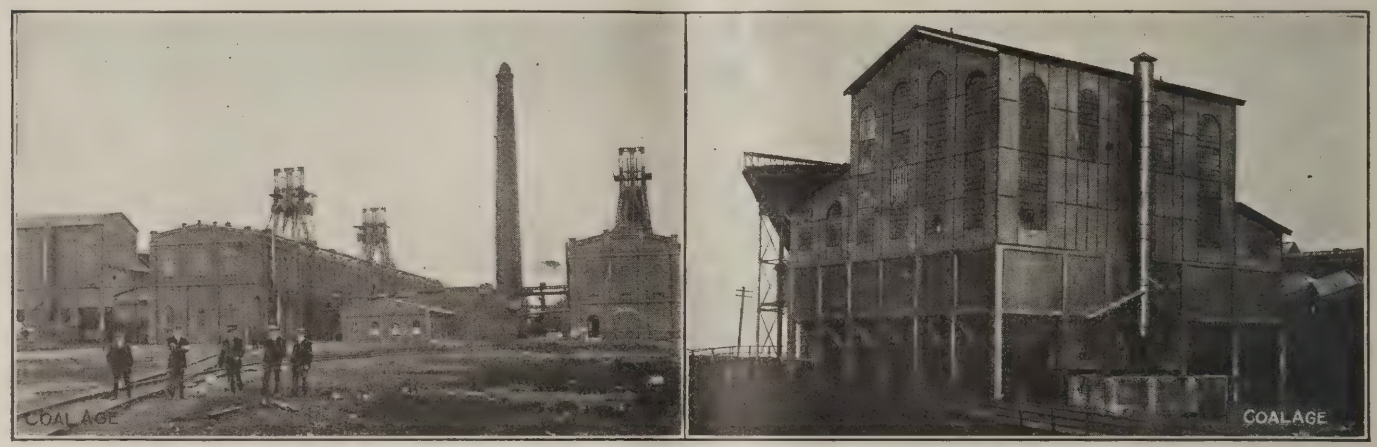
Modern Collieries of Durham, England

By Samuel Dean*

SYNOPSIS—Brief description of a new field recently developed on the southeast coast of Durham. Four collieries are being developed, the oldest mine—that at Horden—having entailed a total expenditure of nearly three million dollars in its initial construction.

What has been called the wonderland of Durham is the southeastern part of the country, between Leaham Harbor and the Hartlepools served by the coast branch of the North Eastern Ry.

Twelve to fifteen years ago this part of the country through which the coast line runs was inhabited only by a few scattered agriculturists, and was the home of the fox and the hare. Occasional fox hunts took place, and the pitman was only seen there when he came over from the collieries farther east to attend the greyhound coursings, and as is his wont, he spent the evenings in song and merriment at the country taverns.



It may seem strange that in England, a rich portion of a coalfield should be without a railroad for so many years, but along the southeast coast of Durham the cliffs are high and numerous deep gorges intersect the land. It had long been realized that the construction of a railroad would be costly; many deep cuts and long, high bridges would be required.

Railroad Cost $150,000 Per Mile

Eventually, however, about the time of the Boer war, in 1900, a beginning was made. The undertaking was gigantic. Gorges 800 ft. wide and 100 ft. deep had to be spanned. One span is 120 ft.—the largest brick arch with one exception on any British railway. The total cost of the line was £30,000 ($150,000) per mile. It was opened for traffic in 1905.

In 1899 shaft sinking had started at Dawdon and Easington. There are now four collieries served by the line—Dawdon, Easington, Horden and Blackhalls. Tremendous quantities of water had to be dealt with in all of them before the coal measures were reached. The magnesian limestone, containing salt water, is approximately 650 ft. thick, and between the limestone and the coal measures there is 50 to 100 ft. of running sand.

Efforts to sink Dawdon and Easington by means of bucket-lift pumps were unsuccessful; over 10,000 gal. of water per minute, in one shaft, was encountered, and eventually after long delays the shafts were sunk with the aid of the freezing process. Dawdon did not com-

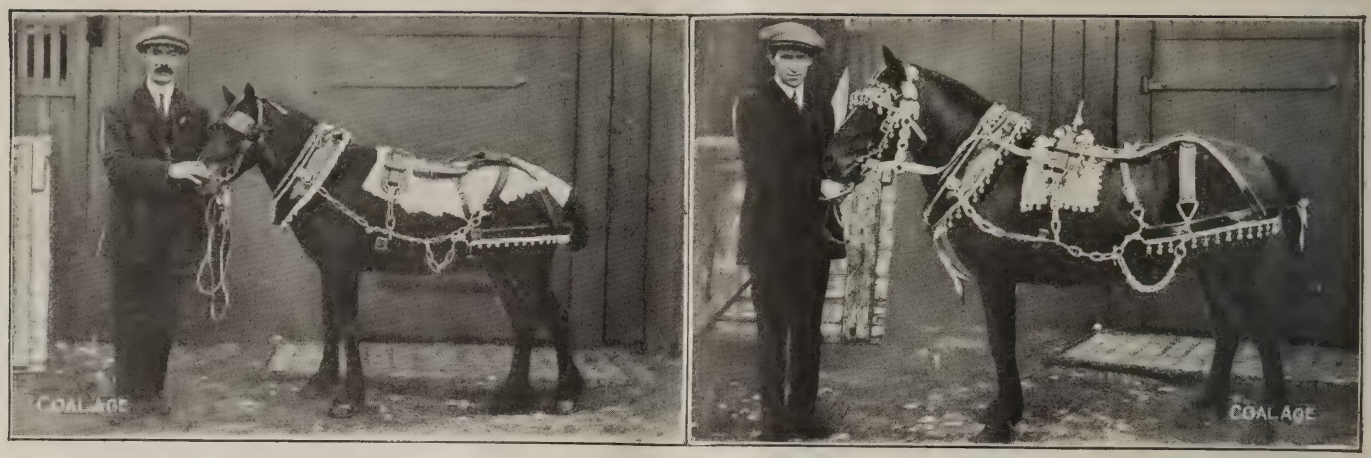
The First-Aid Corps at Horden Colliery

mence to hoist coal until 1907, and Easington was still later, beginning only in 1910. The cost of sinking has not been made public, but it was very great.

Town of 10,000 Inhabitants Quickly Springs Up

Coal was reached first at Horden, which was producing in 1905, and today there is the town of Horden, with a population of over 10,000, on land which was green fields when I first saw it in 1904. The output per day is 3000 tons, and there are about 3000 men and boys employed. This output of 3000 tons supports a town of over 10,000 men, women and children, with a church, several chapels, schools, picture palaces, clubhouses, three gorgeous public-houses or drinking palaces, coöperative store and over 20 shops. Building is by no means over, and the population is still growing.

The cost of sinking the three shafts at Horden, with 36-in. diamond bucket-lift pumps, down to a depth of 1150 ft. was £380,000 ($1,900,000), and the total amount of money spent at the colliery, including sinking the shafts, making pit bottoms and equipping the surface—including standage for empty and loaded railroad cars—was over £550,000 ($2,750,000).



Easington now looks like it is going to challenge Horden, 2000 tons of coal a day are being raised, and what is most remarkable is the large new towns which these

Horden Colliery Foot-Ball Team

"Putter Boys" at Easington Colliery

Prize Pit Ponies at Horden Colliery Carnival

comparatively small outputs support. The architecture and construction is in every way fine, and money appears to have been as plentiful as the water in the shafts.

Four years ago sinking commenced at Blackhalls in the face of unparalleled difficulties. The limestone is 650 ft. thick and contains underground streams. Bucket-lift pumps were employed, and at one time 17,000 gal. of water per minute were handled before the cementation process was adopted, and this has proved quite successful. Two circular shafts, 20 ft. in diameter, have been sunk down to a depth of 1200 ft., and up to date over £350,000 ($1,750,000) have been spent.

Electric hoisting engines have been installed, and the company proposes to erect a garden village surrounding a public park and having a bandstand in the center.

The Carnival at Horden

A carnival or parade takes place at Horden every summer, for the purpose of raising funds for the local hospital. Prizes are given for the most original costumes or groups, and the pitmen's lassies, with collection boxes, pass around among the spectators.

The Youthful Pitman, First-Prize Winner in Cycle Parade, Horden Colliery Carnival

The mines are being worked on the three-shift system, and, as the Northern custom is, the first shift of hewers or diggers descend about 4 a.m. Diggers do not always have the same places, lots are cast every quarter, and a man takes his chance of getting either a hard or a soft place to work. This is called "cavilling." The boys who haul or push the coal from the coal faces to the partings are called either "pony putters" or "hand putters." In some thin seams the small ½-ton cars are still pushed by hand to the partings.

The officials and company men are numerous; there are deputies or firemen, back-overmen, fore overmen, master shifters, master wastemen, undermanagers and a general manager. The manager's position is similar to that of the superintendent at American mines, except that he must hold a first-class certificate, and generally his status is higher than that of a superintendent. Managers of the present day are, as a rule, mostly men with a high technical training; owners have evidently discovered that this type of man gives them the best results.

The Lake Freight Rates—The carriers in trunk-line territory north of the Ohio and east of the Mississippi Rivers, filed tariffs with the Interstate Commerce Commission on Oct. 15, 1913, to be effective after approval, advancing rates on all freight, including coal. This action, if made effective, would add 5c. per ton on Lake cargo coal to a rate fixed by decision of the Interstate Commerce Commission, Mar. 11, 1912, which, in its judgment, "from the point of view of the specific cost of doing this particular business, is still too high."

The reason the Lake cargo rate was protested was not for its amount, but that its relation to other competitive districts was not right. The rate fixed by the commission, Mar. 11, 1912, and especially the advance now asked by the carriers, continues that unfair relation.

Those interested are not concerned in the proposed advances on other commodity rates, nor do they object to profitable coal rates from all districts; but are taking the ground that the carriers must first establish a proper and equitable relation among the rates from all competitive districts, so that if additional revenues should be allowed to the carriers, and coal should supply any part, each district would bear its proper share of the burden

The 108th Meeting of the American Institute of Mining Engineers will be held in Salt Lake City, Aug. 10 to 14, 1914 inclusive, with headquarters at the Hotel Utah. Several coal papers will be read at the Thursday morning session. Bradley Stoughton, 29 W. 39th Street, New York, is secretary.

Plumbing the No. 5 Shaft of the Madison Coal Corporation in Illinois

By G. E. Lyman*

SYNOPSIS—Description of a particularly well executed shaft-plumbing operation, using the two-shaft method. Some original and valuable notes on the inaccuracies permissible in this class of work are also given.

In the early days of mining, when it generally required some unusual emergency to induce an operator to have a survey of the workings made, the inaccuracies of the maps were frequently only equalled by the startling crudities of the field method employed. To no part of the work did this apply more pointedly, perhaps, than to the connection of the underground and surface surveys.

The old-time surveyor, equipped with his Jacob-staff and link-chain, was well content to take sights above and below on the hoisting rope, or perhaps a corner of the shaft, and then carry his compass lines forward into the workings with a simple faith that at least did credit to his intentions. With the modern development of mining operations, however, and the necessity of maps in keeping therewith, the several methods of shaft plumbing now in use were gradually introduced until today we have means of handling this critical part of the work that are really astonishing in their accuracy; they also form a most fascinating piece of work for the engineer, as well as an interesting problem for the practical mathematician.

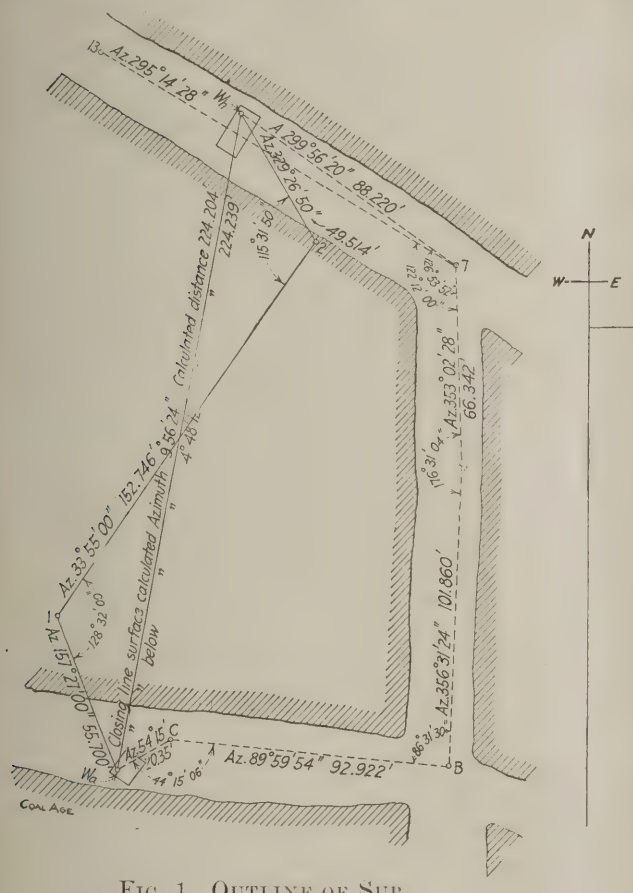


Fig. 1. Outline of Surface and Underground Traverse

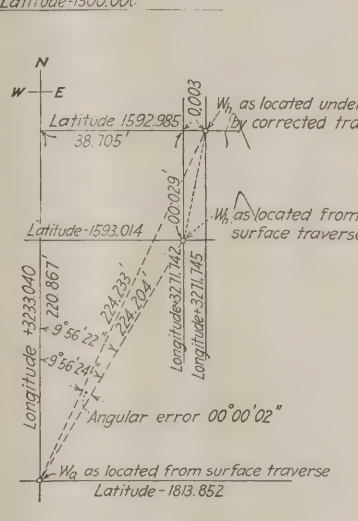

Fig. 2. Sketch Showing Angular and Coördinate Error

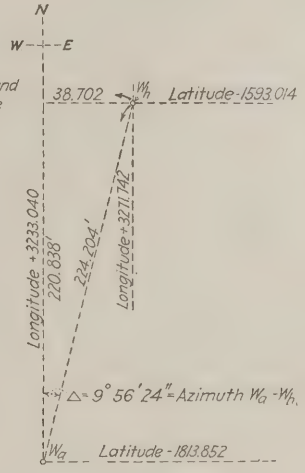

Fig. 3. Determination of Azimuth between Wires

Preliminary Considerations

It may be said, briefly, that all the more accurate methods of correlating the top and bottom surveys of shaft mines, have as their basis the determination of the underground coördinates of two temporary points on the surface survey, which are transferred below by means of plumb lines and carefully tied in to underground stations, so as to form a permanent base line for all future mine traverses. These two plumb lines may be in the same, or in different shafts. Contrary to a somewhat widespread belief it is no special advantage to have them both visible from a point on their line produced, since the old method of "jiggering" to get on line permits of a considerable angular error, which increases with the proximity of the transit to either wire. In fact, this method is not much used now, except to handle the limited amount of development work done before the shafts are connected below.

It is evident that the further apart the two plumb lines are placed, within reasonable limits, the more accurate will be the results. Consequently the usual arrangement of bituminous mines, with their separate shafts for hoisting and ventilation, offer extremely favorable conditions for this work.

It is the purpose of this article to outline briefly the entire operation, with the necessary computations, as performed at Mine No. 5 of the Madison Coal Corporation, at Mt. Olive, Ill., during the regular work of the engineering department. This mine has two shafts, hoisting and air, about 420 ft. deep. Surface obstructions prevent

*Mining engineer, Madison Coal Corporation, Glen Carbon, Ill.

sighting between the shafts on top, and the arrangement of the bottom also makes it impossible below.

General Scheme of Procedure

No. 18 steel wire was used for plumb lines, with 60-lb. boiler weights attached below and swinging in tubs of water covered with an inch of black oil. On top the wires were suspended from heavy timbers securely spiked in place. About an hour was required for all vibration and swinging of the wires to cease. It is absolutely necessary, of course, that all work below be suspended, and the fan stopped during the entire operation. Measurements were made with a steel tape 200 ft. long, under standard tension, and compensated for temperature.

Fig. 1 shows a general outline of the surface and underground surveys, the former being shown in solid and the latter dotted. Stations 1 and 2 are permanent surface monuments set in concrete, which have been carefully tied in to the surface traverse. The azimuth from 1 to 2 is 33° 55′ 00″, and the distance is 152.746 ft. From this base line the remainder of the work is carried forward. The wire in the hoisting shaft is designated as W_h, and in the air shaft as W_a; 7 and 13 are permanent mine stations, which are ultimately to form the underground base line.

For the sake of obtaining the greatest possible accuracy, all angles were measured direct from foresights and the azimuths calculated therefrom. Each angle was repeated five times, one-fifth of the final result being taken as the correct value.

The cumulative repetition of an angle is an operation familiar to engineers, but for the information of the student it may be stated that it is necessary to use a transit graduated in azimuth from zero to 360 deg. Then, with the vernier set at zero, a foresight is taken on one line of the angle, the upper motion released and a foresight taken on the other line of the angle being measured. The lower motion is then released, a sight taken on the first point again, the upper motion released and turned to the second, and the process repeated as often as desired. In the measurement of the angle at C underground, for instance, after five repetitions in the manner just described, the vernier traversed the entire circle twice and read 1° 15′ 30″, making the total angle turned $(2 \times 360°) + 1° 15' 30''$, or 721° 15′ 30″, one-fifth of which, or 144° 15′ 06″ is the correct value of the angle.

Computations

The measurements of the angles at Stations 1 and 2 gives us the data on which the following computations are based, resulting in the accurate determination of the surface coördinates.

Fig. 3 shows the right triangle which is formed by the coördinate relation of the wires, with legs 38.702 ft. and 220.838 ft. long, from which the following is derived:

$$\textit{tangent of angle at } W_a = \frac{38.702}{220.838} = 9° 56' 24''$$

$$= \textit{azimuth of } W_a - W_h$$

$$\sqrt{220.838^2 + 38.702^2} = 224.204 = \textit{distance } W_a - W_h$$

The net result of the above is the accurate determination of the azimuth and length of the imaginary line connecting the two wires on the surface.

Returning to the underground work, reference to Fig. 1 shows that a somewhat more extensive traverse is required to connect the wires below. The surface instrument is accordingly set up at C, and the graduated plate brought approximately to azimuth by means of the needle. It is not necessary to do this, however, as any azimuth may be assumed to start with, but the method indicated has the advantage of keeping the subsequent correction within more reasonable limits. The angles are measured, as shown in the figure, by the same cumulative repetition as used in the surface work. At Station 7 an angle is read to Station 13, and the line between the two permanent stations eventually forms the base line for all subsequent underground work.

It should be noted that although this part of the work is referred to an assumed azimuth, the angular relations of the traverse between the wires are as precise as though we already knew the correct azimuth and were working from it.

The accompanying table shows the result of this work, the coördinates of W_a having been taken the same below as previously determined for it on the surface.

Applying the same computations as described for the surface work, we obtain the azimuth for the closing line underground, W_a to W_h, as 4° 48′ 12″, with a distance of 224.233 ft. Obviously we secure exactly the same result here, regardless of the azimuth assumed, or the coördinates taken for W_a below, as the only requisite is that the angular relation of the underground traverse shall be correct in itself.

Our surface and underground work now compares thus:

	Azimuth	Distance
Surface, Wa to Wh	9° 56′ 24″	224.204 ft.
Underground, Wa to Wh	4° 48′ 12″	224.233 ft.
Difference	5° 8′ 12″	0.029 ft.

We find, therefore, that our calculated azimuth for the line connecting the wires below is 5° 08′ 12″ less than the calculated azimuth of the same line on the surface. Consequently it is only necessary to make this correction in the azimuths of the underground traverse between the wires to bring it in precise agreement with the true

azimuth as used on the surface work. The azimuth of the permanent underground base line, 7 to 13, was found to be 295° 14′ 28″ as run with the assumed azimuth, and adding our correction we obtain 300° 22′ 40″.

This is the true azimuth of the line 7 to 13, and from it the surveys can be carried out into the workings. The azimuth W_h to 7 may now be corrected, and the true coördinates of 7 thereby calculated, using for this the surface coördinates of W_h. While this completes the connection of the surface and underground surveys, a further study of the figures is interesting.

Checks

The calculated distance between the wires underground is 0.029 ft. longer than on the surface. Practically these distances should be the same; theoretically they should be almost infinitesimally closer together at the bottom, on account of the convergence toward the center of the earth. The calculation and comparison of these distances offers a convenient means of checking the entire work, and the discrepancy in lengths is frequently referred to as the error of the operation, which in the case under consideration would be in the ratio of 0.029 ft. to 224.204 ft., or as one in 7731, approximately. Sometimes the angular error is established by considering its tangent as 0.029 ÷ 224.204, which would indicate that it amounted to 00° 00′ 28″.

However, while satisfactory approximations from a practical standpoint, neither of these assumptions are correct; the accurate determination of the amount of error can only be made by correcting the entire underground traverse, and starting with the surface coördinates of one wire, figure the underground coördinates of the other wire and compare them with the surface location of same. The accompanying table shows this computation in full.

Fig. 2 shows, by means of a distorted sketch, the coordinate relation of W_a to W_h as located from the surface traverse, and W_h as located underground from corrected traverse below. The coördinates of W_h should, of course, be the same below as on the surface, but we find an error of 0.003 ft. in longitude and 0.029 ft. in latitude. This error is a fixed quantity, and will exist in all future underground work.

The azimuth of the closing line underground, as calculated from the coördinates of the corrected traverse, is 9° 56′ 22″ (Fig. 2) showing an actual error of 00°00′ 02″ as compared with the true surface azimuth of the same line. This insignificant error, at first sight, appears to be absurdly small, but a little study of Fig. 2 will show that there could be a considerable coördinate error and yet have absolutely no angular error which could be detected by computation, in which case W_a and the two locations of W_h would lie on the same straight line.

The distance between W_a and W_h figures exactly the same on the corrected underground traverse as it did with the assumed azimuth originally used, which is as it should be, since both results were obtained by purely mathematical processes, into which any error of field work could not enter.

Even the determinations of error given above cannot be said to be precise further than that they represent the total errors of the entire operation concentrated at the wire W_h. It is impossible to take account of any interior compensating error which may have occurred.

It is evident that a modification of this method may be readily applied to two wires in a single shaft, yet the advantage of using two shafts is readily apparent when it is considered that the effective base line (distance between wires) regulates the accuracy obtainable.

High-Production Records

The mines of the Superior Coal Co. have maintained their producing power for the year ending June 30, 1914. These mines, three in number, located in Macoupin County, in the central part of the state, produced, for the year just closed, an average of 11,383 tons per day worked.

The individual records of production for these mines were as follows:

Mine No. 1, produced 754,993 tons, hoisting 217⅞ days, and made an average hoist of 3565 tons per day.

Mine No. 2, produced 887,863 tons, hoisting 225⅛ days, and averaged 3944 tons per day.

Mine No. 3, produced 891,457 tons, hoisting 224$\frac{15}{16}$ days, and averaged 3961 tons per day.

From these figures, it would be fair to say that, had there been no labor troubles in Illinois during 1914, these mines would have produced 3,000,000 tons of coal. This is a good record; but the record for production is not the only thing to commend in the operation of these mines. The records for fatal and nonfatal accidents were equally good, there being three fatal and 23 nonfatal accidents, for the year ending June 30, 1914. The nonfatal accidents were only those that caused the loss of thirty or more days. No. 2 mine has not had a fatal accident for nearly two years; and, in that time, has produced nearly 2,000,000 tons of coal.

The production per fatal accident, for the year just closed, for these mines, was 844,820 tons, as compared with 782,591 tons for the year 1913, the Coal Report for Illinois, 1913, showed 352,407 tons mined, for each life lost. The production of these three mines, per nonfatal accident, was 110,194, as compared with 60,338 tons mined in the state per nonfatal accident.

The mines of the Superior Coal Co. have made a good record since they were opened up, and it would not be surprising if the year 1915 surpassed all previous records. Under the able management of John P. Reese, general superintendent, and John Ross, his assistant, at Gillespie, records have and will be broken. Both men are active in the safety-first movement, and sincere in their efforts to bring about a new order of things whereby mine accidents will be reduced to the minimum and suffering decreased.

Extracts from a Superintendent's Diary

Occasionally, when the pressure from the big bosses' office threatens my nerves, I pull down the roll top and make a trip into the mines. These trips being largely the promptings of impulse, I have no definite route mapped out, but wander about pretty much as the spirit moves me.

Very often I run into groups of men at the mouth of a room, discussing subjects of vital interest to themselves and myself as well, while at other times, I meet men singly and in pairs, at the working face and, because the meeting is free and easy, learn much about their personal affairs as well as their likes and dislikes.

Sometimes on these wanderings, a morning slips by so quickly that I run into a man eating out of a dinner pail without realizing that it is even near noon and, for fear of offending, I sit down and share the contents of the bucket. In this manner I have come to know much about the cooking accomplishments of many of our miners' wives and, incidentally, something about the feeling existing between the woman who prepares the bucket and the man for whom it is prepared.

For example; if the host is a young man from the boarding house, his standing with the landlady's daughter is evidenced by the trimmings in the bucket. Likewise the newlyweds are given to garnishments and other reminders of thoughtfulness.

Old man "Steady" who neither drinks nor beats his woman on pay days, finds no fancy work in his basket, but the delicious jellies and cakes and relishes assure him of the welcome that is awaiting him at the day's end. Possibly when I get him to talking I find that he was born in Scotland, and worked in the mines there when a young man. He remembers his dinner bucket of those days very distinctly; no jellies and pies and cakes (they have no money for such luxuries in the old country) but good plain food and plenty of it.

Then there is old man "Never-do-well." Some of the crumbs and leavings from his bucket are so unpalatable that even the mine rats refuse to keep him company while he is lunching. Of course, he is married to a Mrs. "Never-do-well" or such things could not happen.

Sometimes the Character of the Miner's Lunch Indicates Conditions at Home

Sometimes a scanty, poorly prepared lunch is an indication that back home some great misfortune is being met heroically. Today I learned of such an instance: Our boss driver is married to a girl who has not been able to use either one of her hands for two years. Six months before her marriage she picked up a dynamite cap that her father had dropped at home and in some manner exploded it while holding it; she went to the altar a hopeless cripple just as she is today.

Her own father advised Bruce against the marriage, after the accident, because of the girl's helplessness, but Bruce had only one answer: What's that got to do with her soul? And now, early in the morning and late at night Bruce does the work that those poor maimed hands would have done so willingly, if fate had willed otherwise: Hired help with boss driver's wages are beyond planning.

I learned all this from Bruce himself. I came upon him just as he was finishing his lunch and when I noticed the shape of the biscuits in his pail, I, as tactfully as possible, suggested that he send his wife to the cooking school that some of our ladies have arranged for, next week. This apparent misjudgment on my part, as to his wife's ability, cut deep and so the poor fellow told me the whole pitiful story that I might not misjudge her. Not once during the recital did he intimate that he was deserving of praise or sympathy.

Numbers or Skill in First Aid

By a First-Aid Man

First-aid work has done much during the last few years to relieve suffering and to prevent relatively simple injuries from developing into those of a more serious character. Among mining men, in particular, the influence of first-aid classes has been tremendously helpful in creating a better spirit of understanding between bosses and men, for it is scarcely possible that any man can work alongside his boss trying to learn to be useful in case of an accident without both becoming more friendly. Finally, there comes an immense satisfaction to the man equipped with some knowledge of first aid in knowing that if he does witness an accident, he is capable of being of some intelligent service and is not required to stand by, wishing he knew what to do and yet unable to ease the condition of the injured person.

It would be ideal if all persons were trained in the elements of first aid. In order to promote greater interest in the subject, many very interesting and instructive demonstrations are held each year, and these cannot fail to awaken the interest of the public. However, it is well to call attention at this point to the fact that these demonstrations may fall short of their real purpose.

First aid is not a means for producing a show or a pageant; it is, on the other hand, a splendid movement in the direction of the betterment of all mankind. There is then a certain danger in trying to organize a large demonstration, because it is human nature to seek to emphasize the number of participants rather than the excellence of their work.

It is certainly far better at any place to have a small corps of well trained first-aid men, fully equipped and thoroughly reliable, rather than a large number of men, poorly or only partially trained, rushed through a certain amount of instruction to make them available for some spectacular occasion, and whose very lack of sound training is likely to cause them to look upon the whole first-aid movement as of no permanent consequence.

Before a demonstration, *all* the men, not only the leaders or captains, who are to take part ought to be proficient in all the work to be demonstrated. This can only be guaranteed when proper classes have been conducted, under competent supervision, for a sufficient time to give each man an opportunity to become thoroughly familiar with the work, followed by examinations and practical demonstration by each individual of his ability to treat all the most common cases to which first aid is applicable.

Among the best of the good ideas that have been initiated in recent years, first aid may well be grouped. Its interests, however, like those of the other movements, ought to be well guarded.

The Labor Situation

SYNOPSIS—The Union has gained a victory in the anthracite region, this time over its recalcitrant members who desired to strike in violation of a contract. In Central Pennsylvania, the operators are preparing to sue the Union for permitting those things to be done which the Union has just successfully averted in the anthracite region. In Ohio, some progress toward settlement and a large advance toward peace have been made. At the Bache properties in Arkansas there is the peace which comes when everything combustible is burned or burning. The Bache-Denman Co. and its allies are bankrupt and the coal is burning in two of the mines.

Last week, we stated that the men working at the mines of the Delaware, Lackawanna and Western Coal Mining Department, rejecting the features in the wage scale requiring arbitration, were preparing for a strike. But the Union ultimately got the upper hand and held the men to their agreement. The men from 15 local unions had asked that certain alleged grievances be adjusted. If these grievances could be regarded from any point of view as scale violations, the men were justified in protest and acted within their right. The redresses desired were abolition of the patrol system and an adjustment of the machine-mining rate and to this is now added the recognition of the general committee in any new conditions that may arise at the mines.

REALLY NOT A NEGOTIABLE MATTER

While it was certain that the complaints made by the workmen did not on their face allege violations of the mining agreement, and one demand, at least, was such as could not be conceded by the company still Colonel R. A. Phillips, the vice-president and general manager consented to discuss the questions. In fact there was no other way open. It would not do for one of the parties to an agreement to decide whether the matter at issue did or did not offend against the agreement or was or was not within the bounds of reason and therefore insubmissible to negotiation, and moreover, the agreement seems to anticipate modifications in working conditions not to be classified as violations of the contract and to leave them open to the regulation of the conciliation board.

There were 57 representatives of the locals and the number was soon found unmanageable, so six men were appointed to act for all 15 unions. It was alleged this change was recommended by Colonel Phillips.

Thus far, all was almost regular though strictly speaking the pourparlers should have been between the district officials of union and company. But as Colonel Phillips had agreed to meet representatives of the miners at any time he had no just cause of complaint; nor did he make any but conceded many matters desired of him.

But the grievance committee backed up 18,000 employees believed that it could lay aside the agreement of 1912 and compel Colonel Phillips to grant its demands, without bringing the matter before any conciliation board. To this end the miners voted to give the grievance committee the right to call a strike. Now strikes and lockouts are forbidden under the agreement. If the employees' representatives and their employer cannot agree ,the issue must be taken before a conciliation board, and Colonel Phillips' willingness to hear the grievance of all the unions through their unofficial spokesmen did not compel him to sweep aside the appointed method of adjudicating disputes. In fact the men were at fault in not acting through their district officers as provided. They were disloyal to them, as well as to the agreement. Colonel Phillips therefore refused as was his right to argue the case any more with his men, except before the proper authority.

REALLY THE POVERTY OF THE UNION NOT ITS PRIDE RESTRAINED IT

The union officials, meanwhile, held back. They did not desire, as District President John Dempsey tersely stated, to cross any bridges till they came to them, a habit of caution which has been distressingly frequent with the union at all times. Its duty, too often evaded, is from the first to control the men, preventing all breaches of the agreement.

But even the final pacification of the would-be strikers is perhaps hardly to be credited to the good faith of the union officials. Perhaps it was nothing but the depleted condition of the union funds which really prevented a strike. True the local union had, on June 30, $75,643.67 in the treasury but after all this was only $4.20 for each probable striker should the trouble be strictly confined to the 18,000 in the D. L. & W. employ. As the grievance committee talked of calling out 8,000 more, it is easy to see that $3 would have been the total relief the men could have expected from funds on hand, as the main organization and the American Federation of Labor are practically without a reserve.

The position of the company was further strengthened by the fact that the coal business is so quiet that there is no anxiety relative to the possible idleness of the mines. Prudence therefore was powerful enough in itself to dictate an observance of the agreement. A personal letter was sent however by the D. L. & W. July 29, to all its employees but strange to say this rendered them hostile rather than conciliatory, so unwilling were they to consider the company's side of the argument.

There has been at all times a body of men in favor of an amicable settlement without a strike. These men recognized Colonel Phillips' fairness. Still they believed the new conditions justified the general committee in its independent action and they felt that machine mining and the patrol which were new matters should not be left to the conciliation board. Many of these men failed to vote when the referendum on the proposed strike was taken.

When, on July 31, the district president spoke against a strike as a violation of the agreement, and Colonel Phillips on being interviewed, promised to adhere to all promises made to the general committee, the strike was voted off and arrangements made for the leaving of the whole matter to the company and the district officers. In fact nothing could be more seemly than the declaration of the subcommittee as given to the press. A new atmosphere pervaded the whole dispute.

NESQUEHONING AND NOTTINGHAM

There are two other centers of unrest in the anthracite region, the Nesquehoning colliery of the Lehigh Coal & Navigation Co., and the Nottingham colliery of the Lehigh & Wilkes-Barre Coal Co. In the first the grievance of the "consideration men" is being discussed. When a man used to reach a place in the mine where he could not make money or where the material taken out was not measured, the company paid him $3.34 per day. Recently an effort has been made to pay him by the cars loaded. While some men working "by car work" were satisfied, when a vote was taken some weeks ago, it was found that 90 per cent. of the men were opposed to it.

The men at the colliery have taken up the matter with the company officials in due order and it now goes to the conciliation board at Hazleton Aug. 3. It is a pity that a similar disposition was not made of the D. L. & W. dispute in the earliest stages, before feelings grew so strong as to urge a strike and to suggest a practically new agreement to that already in force.

At Nottingham, the company has supplied, it is stated, a powder of less strength than that formerly employed. As the miners have to pay for their powder, this involves greater expense. There is no reason to believe that this directly assures the company greater profit, but it does probably result in the production of larger coal. The miners talk about carrying the case to court and testing whether the company can restrict the miners to purchasing their powder supplies from the company. Both these issues are important but the action in each case is in accord with the agreement and so creditable to the miners.

SUIT AGAINST UNION IN CENTRAL PENNSYLVANIA

In Central Pennsylvania, the policy of the union of permitting the members to violate the agreement at will has caused the Association of Bituminous Mine Operators of Western Pennsylvania to bring suit against the union. The companies claim an aggregate loss of $200,000. On July 21, the committee of the Association met in Clearfield and decided to move headquarters from Philadelphia to that town.

"PADDY" GILDAY TO JOIN THE OTHER UNION MEN AT WASHINGTON

It is stated that Patrick Gilday of Morrisdale Mines, Penn., is about to accept an office from President Wilson. It will be remembered that Gilday is president of the second district of the United Mine Workers of America and was one of the commissioners of conciliation in the Kanawha strike. While he does not have the magnetic qualities of the other mine

leaders, there is evidence that, at least of late, Patrick Gilday has been a credit to the body to which he belongs. He believes that the contract between miners and operators should not be violated and that any one so doing should be penalized. Only recently, we spoke highly of his attitude and we shall be truly sorry if he resigns.

It is said that Thomas Haggerty of Reynoldsville, Penn., who also figured in the Kanawha strike and who lives in the district, may be chosen as his successor. He is now a member of the National Executive Board representing District No. 2. James Purcell is also seeking the office.

HOCKING VALLEY RESUMES AUG. 3

After being in continuous conference at Columbus for more than a week the scale committee of operators and miners in the Hocking Valley district came to an agreement late Wednesday evening July 29. The question as to which method should be used in weighing coal under the new mine-run law was the cause of the deadlock and the matter in debate was left to the individual corporations and their miners to decide separately. The miners strenuously opposed the plan of weighing the lump and slack separately and since the tipples were old-fashioned that was the only plan that could be suggested by the operators. In some cases the miners have agreed, until the tipples are rebuilt, to estimate that the slack would add 28 per cent. to the weight of the lump coal. In other cases temporary weighing apparatus will be installed. As a result of the agreement practically all mines in the Hocking Valley district will resume operations Aug. 3. The Hocking Valley district mines about 9,000,000 tons per annum, employs about 12,000 men and produces about one-fourth of the whole output of Ohio.

Several minor changes were made in the working conditions of the previous year. Trappers, when they are superannuated miners are to be paid $1.50 instead of $1.25 per day and firemen's wages are to be based on an 8-hr. day.

It is estimated that it will cost in the neighborhood of $12,000 to $15,000 to rebuild each and every tipple in the Hocking and Jackson districts to conform to the requirements of the new law. This will mean an outlay of many thousands of dollars. In some cases where the mines are about worked out the tipples will not be rebuilt and the operations will be abandoned.

POMEROY DISTRICT RESUMES BUT MASSILLON AND CROOKSVILLE HAVE A DEADLOCK

In the Pomeroy district working conditions were adjusted with little trouble and mines are scheduled to start operations at once. The tipple question did not arise in these negotiations as practically all the tipples had been rebuilt during the suspension.

The conference in New Philadelphia of the scale committees of the Massillon district ended in a deadlock and an adjournment was taken until Aug. 4. The Crooksville district also had trouble in settling working conditions. Up to Aug. 1 no agreement had been reached. It is also stated that the Bergholz agreement has been signed.

It is believed that in eastern Ohio trouble with the Industrial Workers of the World is about over. Practically all the pumps and engines are manned and the parades of agitators have ceased, owing to the efforts of the sheriffs in Jefferson and Belmont county who arrested the ring leaders. The sheriffs succeeded in swearing in a large number of deputies to preserve order.

The coal operators mining the No. 8 or Pittsburg seam in Ohio have agreed to meet the miners in joint conference at Wheeling, W. Va., Wednesday afternoon at 2 o'clock. President Albasin, of the subdistrict union, called upon operators in Bellaire Sunday and asked if they could meet the miners. They arranged to enter into conference with them Wednesday morning, Aug. 5, but changed to the afternoon at the request of the miners. Concessions are expected and a settlement is expected to be made before next week.

The agreements in other sections being based on the promise that no concession would be made to eastern Ohio operators, the Union, it would appear, should make an equal concession to the other Ohio mine owners should it permit the eastern Ohio operators to make a more favorable scale. In fact this would be wise, promise or no promise, for the man who sets his price above the market watches the seller pass up the street and makes no sales.

A CONSTABLE CHARGED WITH COMPLICITY TO MURDER

The injunction proved itself unable to save the properties of the Bache-Denman interests because of a deplorable weakness of everyone from the U. S. attorney-general down. There has been too much terrorism on the side of the disorderly and too much maudlinism on the part of the law-abiding. The judge of the court who showed as much courage as any one failed to pass promptly on the contempt-of-court charge against Stewart, Slankard and others.

Now there are further complaints and the contempt case may be reopened or a new case filed. James Slankard, the constable of Hartford, Ark., already charged with contempt is now under indictment for complicity in the alleged cold blooded murder of the two mine guards at Prairie Creek. An employee of the Bache-Denman Coal Co. recently made affidavit that Slankard stood guard over a log house, where the union miners are said to have executed I. Sylesberry and J. Baskin after the all-night fight at Prairie Creek.

FOUR DAYS' RIOT ENDS IN RECEIVERSHIP

Franklin Bache was made receiver of the Mammoth Vein Coal Mining Co., the Coronado Coal Co., West Virginia corporations, the Bache-Denman Coal Co., an Oklahoma corporation, the Hartford Coal Co., the Sebastian County Coal Co., the Denman Coal Co., the Bache & Denman Coal Co., the Mammoth Vein Coal Co., the Mammoth Vein Royalty Co., and the Prairie Creek Coal Mining Co., all Arkansas corporations.

The combined capital of the interests is said to be $1,500,000 and the petition declares the value of the property $700,000. Necessary payments of royalty to T. W. M. Boone, are declared to be the cause for throwing the companies into bankruptcy.

In reciting the reasons for the appointment of a receiver it alleges that on Friday July 17, three of the companies' mines were destroyed in a riot of striking miners. On the next night the Hartford company's Dallas mine, near Hartford was destroyed while on July 20, the Coronado's plant at Arkoal was maliciously fired. It may be added that while the fire in No. 1 has now probably burned itself out, that in No. 3 is still burning and it has probably extended to Mine No. 4, as the mines join underground .

THE SOUTHWEST NEAR SETTLEMENT

On July 21 a joint session of the Southwest Coal Operators' Association and representatives of United Mine Workers of America from Arkansas, Oklahoma, Texas, Kansas and Missouri decided to abolish the existing Arbitration Board of one member and substitute a board to consist of three miners and three operators. The latter board will settle all disputes between employees and employers which are brought before them, without further appeal, though a deputy on the ground will try the case first and adjudicate the matter whose decision will be binding only if both sides assent. This bone of contention being removed, the wage agreement will be taken up by districts.

But great speed cannot be expected in the settlement as there are 3 separate districts; No. 21 comprising Oklahoma, Arkansas and Texas, No. 14, Kansas and No. 25, Missouri.

The Texas understanding is already complete, however, and secures the check-off and the 8-hr. day. The old wage scale is reaffirmed.

STATES OF WASHINGTON AND COLORADO

The miners' representatives in District No. 10 assembled at Seattle, Wash., according to Martin J. Flyzick, their president expect to ask for an increase in wages when the scale is renewed.

The Western Federation of Miners is meeting in Denver, Colo., and on July 27 a special committee reported in favor of a referendum calling for an amalgamation between the W. F. of M. and the U. M. W. of A. The recommendation was for a complete merging of the former in the latter or for a supreme control, the Western Federation being merely a metal-mining department of the larger organization. The Federation adopted this motion on July 31. Committeemen from each body are to meet and propose the merging terms, which will then be submitted to a referendum vote. At the present moment, amalgamation seems assured. Mother Jones is attending the convention.

McDONALD BELIEVES MINERS AND OPERATORS HAVE COMMON NEED

From an unexpected quarter comes a strong adherent of solidarity within the industry. Who would imagine that Duncan McDonald, the hot-headed leader of the Illinois miners, secretary of District No. 12, would argue for operators' profits, and would realize that juice could not be drawn from a squeezed lemon? Addressing the U. S. Industrial Relations Committee he stated that 40,000 of the 90,000 members of the United Mine Workers in Illinois were idle because too many mines had been opened.

These miners were, he alleged, on the verge of starvation, and he stated that the mine workers did not have enough money in their relief fund to meet the emergency. He stated that 18 mining companies failed last year and that there should be a law in the United States which would restrict the opening of new mines. Mr. McDonald did not add, however, that the unions had permitted some of the members to work in coöperative mines for two-thirds of the mining scale,

thus forcing non-coöperative coal-mining operations into bankruptcy.

Equally notable were Edward T. Bent's remarks about the union. Mr. Bent is a member of the Executive Board of the First District in the Illinois Coal Operators' Association and general manager of the Oglesby Coal Co., with an output of about a quarter million of tons per annum. Mr. Bent declared that conditions were better for miners in Illinois than in Colorado or Michigan "because they licked us in 1896."

Mr. Bent desired the centralization of power in the officers of the union believing that while the leaders should be chosen by the miners they should be free to exercise their discretion because their larger viewpoint made them more competent to determine all the issues in a labor dispute.

VANCOUVER ISLAND

The general strike threatened in Nanaimo seems wholly unlikely. The Provincial Federation of Labor declared for it only because the large number of miners overbalanced the judgment of those engaged in other trades. The sentiment is strongly against such a strike. Meantime the strikers have been told that the United Mine Workers will furnish them with no further pecuniary assistance. The union has spent $584,000 in Vancouver but cannot continue such liberality in view of its troubles elsewhere and its present lack of money. There is only $278,000 in the treasury.

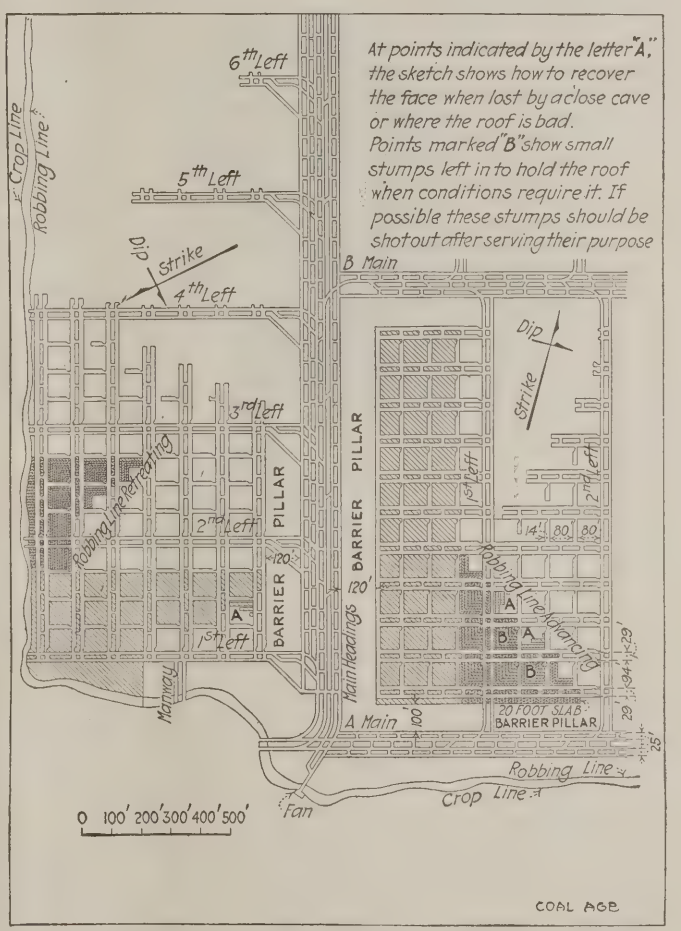
Here and There in the Mining Field

There are two districts in Illinois where a combination of explosive gas and coal dust in the mines render mining operations dangerous. One of these is District V, comprising 33 mines in Saline and Gallatin Counties. Most recent statistics for this field indicate that explosions caused 32.1 per cent. of the fatal accidents, which compares with 2.9 per cent. for the state as a whole. Each employee produces an average of 5.1 tons of coal per working day, while the average daily production per employee for Illinois is 4.5 tons. This high rate production per capita is due to the extensive use of mining machines, 90.2 per cent. of the tonnage being mined by their aid.

Nearly all of the coal produced in the United States is mined by the room-and-pillar system, or some modification of it. The longwall method of mining, so well adapted to many thin seams, is neither understood nor appreciated in this country. The only field where longwall mining produces any considerable tonnage is in northern Illinois, in Will, Woodford, Putnam, Marshall, La Salle, Grundy and Bureau Counties. Longwall mines in this district produce over five million tons of coal annually, which amount is about 9 per cent. of the production of Illinois. The production of this tonnage is attended by 24.5 per cent. of the nonfatal accidents in coal mines in the state. The per capita production per employee is only 2.1 tons, as compared with 4.5 tons for the state as a whole. The longwall method of mining makes an almost complete extraction of the coal in the bed, and produces about 15 per cent. more lump coal over a 1¼-in. screen than is produced in Illinois room-and-pillar mines.

Editor Silliman of the "Pottsville Journal" has the following to say concerning government tax on hard coal companies: "The persecution of the anthracite companies by the government has materially retarded prosperity in the anthracite fields. All the companies are kept in a constant state of apprehension, for they know not what move the government may make next, or how radical and untoward it may be. An official of a large coal company a short time ago made the statement that he firmly believed that fully fifty per cent. of his time was taken up with government suits or government investigations.

"The administration seems to believe that there is a popular antipathy against what is colloquially known as the 'coal trust,' and in order to cater to this antipathy the administration believes it to be its duty, from the viewpoint of political exploitation, to make it clear to the public that it is intent upon either destroying the anthracite coal companies, or driving them out of business.



"The American citizen was told at one time that the anthracite companies represented an 'unholy combination operating in restraint of trade.' He has seen the companies go into court and refute these charges. He has seen them set forth that they are doing only what other decent business men do; nothing more or nothing less."

The Hillcrest Explosion

The jury investigating the Hillcrest disaster declared that death was occasioned by an explosion caused by gas and dust. A rider was added by the jury in which they declared that they believed the company had infringed the Mines' Act. They further suggested that the government enforce a monthly inspection of all men working in mines to see that no matches are carried into the mine and that a sufficient supply of life-saving apparatus is kept as near the mouth of the mine as possible.

A System of Mining in Kentucky

The Mineral Fuel Co. has designed a system of mining calculated to meet conditions as they exist in the district where this company operates. On the left-hand side of the accompanying illustration, robbing work commenced at the back end of the first and second left headings. This plan was possible because a development head-

PROPOSED METHOD OF MINING A KENTUCKY COAL SEAM

ing was driven from the manway. If the first left heading had been driven from the main heading, the rooms would have been widened to the left and a slab taken from the barrier, as is shown on the right-hand side of the illustration, where all the work is done advancing.

The model plan shown here is not designed for a single mine, but is a correlation for the conditions in this entire Kentucky field.

Who's Who in Coal Mining

Peter Kooi

The life of Peter Kooi is a fine example of what grit and determination will accomplish for a fellow when he has nothing more material to fall back upon. Losing his parents at the age of seven and starting to work as an errand boy in a Chicago grocery store at the age of eleven, was the inauspicious start of the subject of this sketch. At the age of fourteen Mr. Kooi became a clerk in the store where he was employed, continuing in this capacity for some years until the opportunity presented itself for him to purchase a railroad ticket brokerage business in Chicago.

In 1904, when 38 years of age, Mr. Kooi closed out his ticket business to become interested in a coal-mining property at Monarch, Wyo. He traveled out to this western

Peter Kooi

state to accept the job of secretary, treasurer and general manager of the Wyoming Coal Mining Co. at Monarch. Two other men with himself owned all the stock of this corporation.

In 1906 Mr. Kooi sold his interest in the Wyoming Coal Mining Co. and in the early spring of 1907 opened up his present property at Kooi, Wyo. Here he has developed a mine with 1800 tons daily output, and having a capacity of nearly double this present production. He owns the town bearing his name and supporting a population of about 400, and is also sole proprietor of the general store, catering to the wants of all these people.

Mr. Kooi never participated in politics, his entire time having been devoted to the particular line of work in which he has been engaged. He is not a hard man to get along with, as is evidenced by the fact that he has never been plaintiff or defendant in a lawsuit.

At one time he was president of the American Ticket Brokers' Association, and is ex-president of the Northern Wyoming Coal Operators' Association. He is a Mason, member and past-potentate of Kalif Temple Mystic Shrine, Sheridan, Wyo., member B. P. O. E., Sheridan, and member of the Rocky Mountain Coal Mining Institute.

Mr. Kooi possesses many admirable traits of character, but no quality in the man is more noteworthy than his ability to attend strictly to his own business, never meddling with affairs that are not his concern. He is the sort of man who must be boss where his interests lie, but he is not ambitious to dictate the policy his competitors, neighbors or friends must follow.

Handling Explosives

Among the recommendations of the Inland Steel Co.'s Book of Rules, relative to the handling of explosives, are the following, slightly modified to suit coal-mining conditions. With other changes and additions, such as the individual needs of each plant readily suggest, they will be found useful for posting around almost any mining operation.

(1) No one shall be allowed to handle or assist in handling high explosives in any way until he has received instructions satisfactory to the superintendent or mining foreman.

(2) Great care should be taken in handling and opening boxes of dynamite. Use a wooden mallet and a wooden wedge. Avoid friction and blows as much as possible and never open the box in a storage house or magazine.

(3) Suitable carrying boxes to hold not over 50 lb. of dynamite, and to have a self-closing cover should be provided for all men handling dynamite. The words, "For Dynamite Only" should be plainly stenciled on each box.

(4) Dynamite carrying boxes for open-pit work should be made as near frost proof as possible.

(5) No explosive should be taken into any mine except in a securely covered case. Explosives and caps should not be transported together.

(6) No explosives should be carried in electrically operated cars.

(7) Dynamite, fuse or caps should not be left in a wet place, or permitted to lie around loose in working places.

(8) Do not smoke or carry a paraffin or oil lamp in your hat when handling dynamite or caps, or when making up cartridges, as hot grease or oil may drop on the caps or powder and cause an explosion. Place your lamp 2 or 3 ft. to one side.

(9) Skewers are furnished for the use of all miners handling explosives and no other instrument should be used for inserting the fuse.

(10) Caps are extremely sensitive to heat, friction or blows. Do not drop them or strike them against any hard body. Do not lay them where they may be stepped on and do not carry them in your pocket.

(11) Place caps on fuse at the place where they are stored, and never near dynamite or powder.

(12) When crimping caps the greatest care should be taken not to squeeze the explosive composition. They should never be crimped with the teeth; there is enough composition in one of these small capsules to blow off a man's head. Cap crimpers must be used in all cases.

Editorials

Plenty to Sell But No Way to Deliver

One of the most important effects the European war will have on the American coal industry will be the opening of the markets of South America to United States coal. Never before have we had brought home to us so forcibly the need of a merchant marine. With our mines, our farms and our factories able to supply the world with fuel, food and clothes, we are seemingly unable to send our products abroad and profit by the fortunate position we occupy in this unfortunate affair. We trust the present Congress will relieve this situation at once and provide the money and authority to purchase ships and solve the greatest problem that now confronts us as a nation.

The Rate Decision

The long awaited decision of the Interstate Commerce Commission in the railroad rate case, has been handed down. The decision is favorable to the railroads in tone, contains some good advice and holds forth much hope for the future, but as to its immediate effect, the findings of the commission are not likely to benefit the roads in any very substantial way. Whereas the railroads asked for increases that would have yielded them $50,000,000, annually, the decision promises only about $14,000,000 a year increase.

Railroad men generally were disappointed in the decision. They say that if they cannot raise rates, they cannot increase wages, nor continue extensive improvements. One thing is sure, the Eastern roads will not find it easy to materially increase their capital because they will not be able to increase their earning capacity.

As for coal and coke, the ruling of the commission expressly forbids any increase in rates on these two commodities, and since these minerals with iron ore furnish more than 50 per cent. of the tonnage on some roads, the 5 per cent. increase, even in the central territory, is allowed on only a part of the freight tonnage.

The best thing about the decision is the commission's mere recognition that the railroads need relief.

Hydraulic Stowing

American coal operators would benefit greatly if they would adopt some of the ideas of European colliery managers concerning the hydraulic filling of worked-out areas underground. The chief advantage of this method of mining lies in the fact that it entails no new danger (so often found in new departures), and it can be employed to considerable advantage in most mines working thick, or moderately thick, seams, under a surface that must be preserved.

In hand-stowing as hitherto practiced, the rooms and entries can be packed only up to 45 per cent. of the space, while by hydraulic stowing, 90 per cent. of the space is filled. From this fact it follows that hydraulic stowing requires more than double the material used in packing by hand.

The time is not far off when all culm piles and waste dumps will have disappeared, because they will serve as feeding material for the hydraulic filling. After all these available piles are utilized, the question of how to obtain sufficient material for stowing will arise. If a blast furnace is near, the problem will be partly solved, for granulated slag is an excellent stowing material. If no furnace is nearby, the mining company may have to bring in its material by rail (perhaps in conjunction with other adjacent companies).

As to the kind of piping best suited for flushing material into mine workings, opinion is divided. Unlined mild-iron pipe is perhaps best suited where the flushing material is small and the consequent wear triffling. This type of pipe has a longer life for this work than that of steel. At a German colliery where different types of piping were used, the mild-iron pipe carried 60,000 tons of blast-furnace slag with the least wear. This style of pipe is generally manufactured with loose flanges, so that it can be turned several times before it is quite worn out.

Wrought-iron pipe with porcelain lining is also used successfully at several continental collieries. The porcelain used is of the very best, with a degree of hardness of 8, so that it can stand the roughest material.

In Germany, about 100 mines have introduced hydraulic stowing. In Belgium, about 10 mines use this same system, while in France a number of mines in the black-coal field have adopted the flushing system.

Hydraulic filling is therefore no longer in the experimental stages, and should be carefully investigated by all coal companies whose mines are subject to gob fires, or where there are excessive losses of coal and timber under present methods. Of course, this system finds its greatest use in thickly populated districts, where surface subsidence must be prevented.

With regard to the cost per cubic meter of stowing, or per ton (which is almost the same), it has been found that this amounts to about 29c.

The Duty of the Buyer

The coal buyer is gradually realizing that on him partly rests the burden of economy in mining. He cannot be brought too soon to realize that coal is a mineral which cannot be pried loose from its bed without breakage, and which is mixed with impurity so that it cannot be purchased as free from admixture of undesirable constituents as can an artificial article.

The buyer has been disposed to accept nothing but a No. 1 product. It would be better if he would frankly meet the situation, especially as regards the condition of the coal as received. All coal will probably be sold eventually in one of two forms, either pulverized or as slack. When all coal goes to market in one of these two conditions the whole problem of mining will be changed.

The operator today is endeavoring to keep his fuel in a lumpy condition and is wasting much money to that end. It is a manifest folly, and a stop should be put to that endeavor by changing the demand of the market before too much money is needlessly wasted.

The marketing of coal for domestic uses should entirely cease, for it places an entirely unnecessary burden on householders, involves great expense to the middleman and much delay to the city in the collection of ashes. It would be better for all houses to be heated by gas distributed under a pressure at least 10 times as high as that now customary. In this way smokeless combustion could be assured. The difficulty is that the present-day gas producer is only really successful where the best of fuel is used. There is evidence, however, that in the future, finer coal and less pure will be used in the gas producer.

The electrification of railroads will also favor the greater use of slack or pulverized coal. It is remarkable how the railroads have failed to take advantage of electrical train traction and to put themselves abreast of the times. To their credit, be it said that, though keen bargainers in a coal trade, they have deplored rather than condemned the price of coal. But they have done a great deal to make coal mining unprofitable by continued demand for a high grade of mine-run and an unwillingness to accept slack.

Advances in the coal industry are quite liable to be along the wrong lines if the coal buyer does not speedily arrive at his ultimate demand. If it is slack or dust which is really needed, why equip a mine with undercutting machines and use such precautions as having cars with low side boards, so that large lumps must be saved for building up the sides if a full load is to be secured? If fine coal is needed, the ingenuity of manufacturers should rather follow Gen. Edward O'Toole's lead, and the pneumatic transportation which he has put in execution is the natural sequence.

And when the railroad is reached, if dust is to be shipped, tank cars, loaded and unloaded pneumatically, are the natural *desiderata*. The labor and cost of unloading will thus be minimized. And when fine coal is the end sought, probably a pneumatic separation will replace washing and gravity methods. The effect of this change on the cost and facility of bunkering vessels at the dock and in the high seas would be revolutionary.

In fact, to know what is ultimately sought makes true efficiency possible and saves intermediate journeyings to that goal. If we are approaching a time when there will be as little need for nut and lump bituminous coal as there is now for broken anthracite, we should speedily realize it and hurry the day along, for every step to accommodate mining to present inefficient conditions is mere lost motion. The duty of the buyer is clear, but will be plainer yet if the seller points it out to him.

The Storage of Coal

In view of the immense demands of industries such as gas-making, etc., where one works will use from 1000 to 2000 tons of coal a day, the question of a proper method of storage is important.

It is generally conceded that no air-stacked heap—whether under cover or in the open—should be piled to a greater height than 20 ft. When this rule is violated, dust pockets are likely to occur, resulting in ignition or spontaneous combustion. For this reason, when 20 ft. is to be the maximum height of the stack, the storage capacity is limited to about 20,000 tons per acre of ground space.

By adopting the wet-storage method, that is, storing under water, the capacity per unit of ground area can be more than doubled. It is likewise true that when submerged, coal does not vary much in temperature and does not deteriorate greatly, due to the gases being more or less confined, thus preventing general oxidation.

Another consideration in wet storage is the prevention of breakage, the pulverization being reduced by the water forming a cushion between the various lumps.

Submerged storage, of course, is not without some disadvantages. The system entails a considerable initial expense, due to the necessity of constructing a substantial reinforced-concrete reservoir. A further consideration is the cost of pumping machinery for emptying and filling purposes. It is furthermore a fact that coal subjected to storage is usually found to be brittle and somewhat dull in appearance. The latter effect is superficial, and on drying in the sun rapidly disappears.

Probably the best method of storage is that known as the "mixed method," where a supply of coal is stacked in the open and an emergency supply is stored under water. The latter supply may stand for 5 or 10 years, and will be found to have deteriorated to only a very slight extent.

Much depends on the locality where the coal is to be stored. If the neighborhood is congested and the price of land high, submerged storage will afford relief by increasing the capacity per unit of ground. If the coal is to be used for gas-making purposes, arrangement should be made as far as possible to set the coal aside for drying before using. This is not so essential when the fuel is used for steam-raising or for firing purposes.

Many engineers believe it is better to carbonize a wet coal giving a slightly increased yield of impurities, than an air-stacked coal which has lost perhaps 10 per cent. of its gas-making value.

Our Export Trade in Coal Negligible

The gross annual export of bituminous coal from the United States (to countries other than Canada), including that used for bunkering purposes, aggregates only 13 million tons. This is not a very important volume of trade when viewed in the light of our total production of 570,000,000 tons annually. Therefore, if we were to lose our entire export trade, the American coal industry would suffer but little. On the other hand, the doubling of our present foreign coal business would hardly be felt by the industry at large. The chief possibility our coal companies have to fear is the general slackening of business throughout the nation, that may result from such a general conflict in Europe.

The imports of goods into the United States aggregate a billion dollars annually. This business nets this country approximately $200,000,000 each year. It is evident therefore that if the war blocks our foreign trade, United States revenues will be curtailed so greatly that our government will probably have to issue bonds to pay current expenses.

Coal Dealer's Remedy against Defamation

By A. L. H. Street*

There is an interesting court decision sustaining the right of a coal dealer to recover damages for libel or slander affecting his business. It is an opinion of the Wisconsin Supreme Court, reported at page 225, Vol. 105, *Northwestern Reporter,* in which the court upheld the right of a retail coal company to recover damages against the mayor of a city, if he falsely stated in a public address that the company not only charged extortionate prices for fuel, but refused to sell at all to persons suffering from illness. This decision reads as follows:

"A corporation may sue for a slander or libel upon it in the way of its business or trade. There can be no doubt that the published letter, which forms the basis of the second cause of action, was libelous per se under the circumstances set forth in the complaint. It charged, in substance, that at a time when there was a coal famine, and people were suffering for fuel, the plaintiff, though engaged in the business of selling coal, not only charged extortionate prices for its coal, but actually refused to sell coal, even at these prices, to people suffering from sickness. Such a charge is libelous, because imputing mean and abhorrent conduct to the plaintiff in the conduct of its business, and thus tending necessarily to injure it in such business.

"It is claimed, however, that, while the words may be libelous when written and published, the same words do not constitute slander per se when spoken, and that there is no sufficient allegation or special damage—hence that the first cause of action is subject to demurrer. This contention also must fall. Words spoken of a person in direct reference to his business or trade, which charge him with incapacity, fraud, trickery, dishonorable or mean conduct in the transaction of his business, thereby necessarily tending to injure him in such business, are actionable without proof of special damage. There seems to be no need of further discussion of the subject."

In this connection it is to be noted that there is abundant judicial authority for saying that any false statements written, printed or spoken of a coal dealer, which on their face tend to injure him in his trade or business, are actionable without proof of special damage if they accuse him of fraud, dishonesty, insolvency, refusal to pay his just debts, the commission of a public offence or any thing tending to destroy his business.

Recent Judicial Decisions

Miner's Duty to Remove or Prop Rock—In removing coal from the side of an entry from beneath a rock, a miner is bound to either first remove the rock or prop it, and cannot recover for injury resulting from his failure to do so. (Kentucky Court of Appeals, Wallsend Coal & Coke Co. vs. Shields' Administrator, 167 "Southwestern Reporter," 918.)

Risk of Injury Not Assumed by Employee—A miner does not assume the risk of injury growing out of negligent failure of his employer to keep appliances in proper condition, unless the danger is known to him or is obvious to a person of ordinary intelligence. (Kentucky Court of Appeals, Ohio Valley & Coal Mining Co. vs. Heine, 167 "Southwestern Reporter," 873.)

Proof of Agency to Buy Coal—In a suit to recover the price of coal, defended on the ground that the person to whom the coal was delivered was not defendant's agent, as claimed by plaintiff, mere declarations by the supposed agent are not admissible to establish his agency for defendant. (Texas Court of Civil Appeals, Kohlberg vs. Awbrey & Semple, 167 "Southwestern Reporter," 828.)

Damages Recoverable for Wrongful, but Innocent, Removal of Coal—When a coal operator wrongfully, but innocently, removes coal from the land of another, the damages recoverable against him are to be measured by the fair value of the coal in place at the time of taking, as determined by its royalty value. (Pennsylvania Supreme Court, Stark vs. Pennsylvania Coal Co., 88 "Atlantic Reporter," 770.)

Mine Driver's Duty to Discover Obstructions—That a mine driver failed to discover an obstruction in an air course does not show that he was guilty of such negligence as bars his right to recover damages for personal injuries sustained by him in consequence of such obstruction, in the absence of a showing that he would have discovered the obstruction had he maintained a reasonable lookout. (Alabama Supreme Court, Sloss-Sheffield Steel & Iron Co. vs. Russell, 65 "Southern Reporter," 137.)

Duty to Provide Props for Miners—The fact that a miner remains at work after failure of his employer to furnish props as promised, does not preclude the right to recover for consequent injury to him, unless the danger of continuing work was so apparent that a person of ordinary prudence would not have encountered the danger. Nor does the fact that he might have safely worked at other places than where roof fell upon him conclusively establish his guilt of contributory negligence. (Kentucky Court of Appeals, Continental Coal Corporation vs. York's Administrator, 167 Southwestern Reporter, 131.)

Commodities Clause of Interstate Commerce Act—The commodities clause of the Hepburn Act cannot be construed to prohibit a railway company to carry coal for a coal company organized by it to buy the product of its miners at the breakers, where it owns no stock in the coal company, having sold the greater part thereof to its stockholders, by whom much of the stock has been resold to outsiders. (United States District Court, District of New Jersey; United States vs. Delaware, Lackawanna & Western Railroad Co., 213 Federal Reporter 240.)

Amounts Recoverable for Injury to Mining Employees—Eight hundred and fifty dollars was not excessive recovery for injury to a coal mine driver where he was confined to his bed for three weeks, and the muscles of one of his legs were permanently impaired, although the leg was not broken. (Kentucky Court of Appeals, Kentucky Midland Coal Co. vs. Vincent, 166 "Southwestern Reporter," 800.) And it is held by the same court that $1000 was not too large recovery for injury to a miner in another case where his leg was broken and rendered shorter than the other. (Big Branch Coal Co. vs. Sanders, 166 "Southwestern Reporter," 813.)

Requirements of Missouri Law Concerning Hoisting Apparatus—Although the Missouri Mining Statutes require the operators of coal mines to provide as safe means as possible for hoisting miners, they do not make an operator an insurer of the safety of employees while being hoisted, the duty being merely to use a reasonable degree of care to maintain the equipment in reasonably safe condition. Negligence on an operator's part is not to be inferred from the mere fact that injury resulted to an employee from a defective condition of a cage; it must also appear that the operator had actual or constructive notice of the defect. (Kansas City Court of Appeals, Ronchetts vs. Northern Central Coal Co., 166 "Southwestern Reporter," 876.)

Discussion By Readers

Mine Signaling

Referring to the mine-signal system described by Mr. McCune, COAL AGE, July 25, p. 149, permit me to suggest that the use of relay No. 2 and the mercury cup are unnecessary for the successful working of the system he suggests. While this system is not new in mining practice, its advantages are obvious. The installation of such a system, however, should be marked with all the simplicity possible.

The accompanying diagram shows the arrangement of the switchboard for the operation of the same system,

IMPROVED ARRANGEMENT OF SWITCHBOARD IN AUTOMATIC SIGNAL SYSTEM

with the elimination, however, of relay No. 2 and the mercury cup. In this diagram, as long as the main circuit remains closed, the branch circuit designed to operate the solenoid and ring the gong will be open. Should anything now occur in the mine to break the main circuit, relay No. 1 is rendered thereby inactive, and, the vibrator being released, flies up and closes the branch circuit operating the gong through the solenoid. This very much simplifies the system and reduces the expense of equipment and upkeep.

The Chemist in Coal Mining

I read the article, "The Chemical Laboratory in Coal-Mining Work," by R. E. Rightmire, COAL AGE, July 18, p. 110, with more than usual interest. The ideas he has expressed agree with mine in every particular. As chemical work in connection with the coal industry is of growing importance, I beg to add a few remarks drawing attention to what constitutes a good coal chemist and what he may be expected to accomplish that will prove of practical importance in the industry.

There are a comparatively few men engaged in the coal industry who thoroughly understand and appreciate the necessity of the services of a good chemist, in any of the operations where coal is mined for domestic consumption, gas or coke making, or even in the preparation of coal for the market. Too often is the work of the chemist, in this line, regarded with suspicion and incredulity; while a more intimate knowledge of the matters in his control, on the part of the operator, would prevent many of the blunders that continually reduce dividends.

Briefly, then, the requirements of a good coal chemist, aside from a general chemical training, are that he must have made a specialty of coal and have studied its geological and physical properties in connection with its chemical analysis. Besides making the ordinary chemical analyses of coal samples and determining the heat values of different coals, the coal chemist must be able to apply his knowledge in such a way that it will prove of practical benefit from a commercial standpoint, as, for instance, in the drawing up of specifications and contracts for the purchase of coal. He must understand the action and deleterious effect of every constituent of the coals offered in the market, so as to discriminate intelligently in respect to their relative economy for the purpose intended. In municipal-contract work, the coal chemist should be the supreme judge.

In respect to a gas-coal proposition, the chemist estimates the practical yield of gas in cubic feet per ton, as well as the B.t.u. of the gas generated per pound of coal, and the same item per cubic foot of gas. He must also determine and report the composition of the volatile matter, and especially the percentages of hydrogen sulphide and carbon dioxide, explaining the effect of these constituents when present in gas intended for fuel or lighting purposes.

In respect to a coking proposition, the chemist determines within reasonable limits the yield in coke per ton of coal, the volume of gas produced, pounds of ammonium sulphate, pounds of crude benzol and gallons of tar per ton of coal, in the modern byproduct coke-oven system. In this respect, the chemist is often able to give much important information based upon the analysis and test of a diamond-drill core; although, as is well understood, the quality and character of the coal may vary in different parts of the seam; and, for that reason, such samples should be taken from different prospect holes. While it is freely admitted that the results of many laboratory tests are not fully realized in practice, such results may be taken as a standard of the efficient yield of the coal in question.

In the preparation of coal for the market, either by washing or by the dry process, the chemist can, by a sink-and-float test and a careful analysis, determine the efficiency of the operation. It often happens that, in washing coal, much good coal is lost that should have been saved and utilized by further treatment for the production of gas or other purpose. The tailings or refuse may contain valuable minerals. It may not be necessary to wash all the coal; certain sizes may pass some specifications without washing. It may surprise an

operator to find that 50 or 60 per cent. of the coal mined does not require to pass through the washery. When it is necessary to remove the sulphur from coal, it is generally important to know whether this exists in combination with iron, as FeS_2, as a sulphate, or as organic or free sulphur. This information will also make known the best means to be adopted for its removal.

A competent coal chemist should be well posted on the coals of the world and be able to classify them. He should be informed, in respect to tonnage, quality and price of coals in different markets, so as to be able to advise intelligently on export business. I firmly believe that a chemist having the qualifications I have mentioned could make himself valuable, on a commercial basis, in any operation where coal is produced or consumed in large quantities.

A COAL AGE READER.

Joliet, Ill.

Magnifying Supposed Evils

Pessimism is a bad habit, and, while it is well to consider a matter from all sides, it is a great advantage to be able to regard, first and foremost, the bright side of every proposition. Coal mining is no exception to this rule. When trouble arises it is, of course, much easier to magnify the difficulties than to say "It might have been worse," and set oneself vigorously to the task of making the best of a difficult situation.

In reading the article entitled "Effect of the Mine-Run Law, COAL AGE, July 25, p. 155, I was forcibly impressed with the fact that the writer of the article greatly magnified the supposed evils of such a law. From his account, one would be led to suppose that there was an utter lack of mine discipline and regulations; and that, instead, the men were turned loose in the mine to shoot and dig coal when and where they saw fit and to load whatever material came first to hand.

Under such conditions, one might expect coal to be shot off the ribs, whereby creep and mine caves would result in much damage both to the mine and the surface, together with the loss of much valuable coal. Mine accidents would be increased, and the records would tell of mine explosions. Calamities are bad enough when they occur, without imagining evils that should be avoided by maintaining suitable discipline and taking necessary precautions in the operation of the mine.

After reading the article of our friend from Kansas, I feel like reassuring him by the statement that all of *our* coal in this district is "run-of-mine." While I cannot say anything in regard to the price the company receives for this coal, I *am* in a position to state fully the conditions that exist in the mine, as a result of employing this method of mining. I would say that fully 90 per cent. of our miners are foreign-speaking men, and while some are fairly good workmen others are very poor. However, we maintain discipline in the mine and suitable regulations are enforced to make the operations of mining the coal quite safe. The headings are driven and rooms turned according to a regular plan, and all pillars and stumps are removed as the work is finished.

Although the conditions in many of our mines are as bad as those that exist in other mines, and although the roof is at times as bad as any I have seen in my 30 years of experience in mines, and although we have clay veins and bony coal and other impurities in the seam, the men do not load an excessive amount of dirty coal. In this district, thousands of acres of coal have been taken out, and yet, with the exception of the draining of a few springs, the surface looks just as good as before the coal was mined.

Though I do not pretend to know much about the new mine law to which correspondent refers, I feel that much of the evil he fears will come to pass can be mitigated and the difficulties avoided, if proper attention is given to enforcing the balance of the law regulating mines.

THOS. HOGARTH.

Heilwood, Penn.

Co-operation in Mining

There has been much discussion recently in reference to the qualifications of a mine foreman. Of the various arguments advanced, about the same number favor the *technical* man as the *practical* man, for this position. One advocate will warmly commend the college man and state good reasons why such a man should be chosen for the position of mine foreman, instead of a practical man with no technical knowledge of mining. Others, again, condemn the practice of giving a position of responsibility in the mine to any other than a practical and experienced man.

Personally, I believe that a mine foreman should possess both practical and technical training. This is especially necessary in order that a man shall succeed as foreman of a *small* mine, where his duties will include not only the handling of the men but the performance of work requiring some technical knowledge. In a larger mine, the foreman is relieved of many of these duties, which devolve on specially trained men who are placed in charge of the different departments. *A little technical knowledge is as essential to the success of a practical man as practical knowledge is to the success of a technical man.* Indeed, theory and practice are a good combination.

But men are not made to order, and the operator must generally choose from the best at hand, who represent two classes. Compare, for example, the man who has set for himself a high standard of achievement and worked manfully and sacrificed much to obtain a college education, in order to better his condition—compare such a one with the man who has continued to work faithfully in the mines, plodding along day after day, and been slowly promoted from one position to another, until there is scarcely a branch of work connected with mining with which he is not familiar. Both of these men have noble qualities and high ambitions. Is it possible for an operator to choose between these two classes of men without doing one or the other of them an injustice? Would it not be better to so arrange their work and duties that they can coöperate by *pooling their resources* and abilities. To illustrate my meaning, I will recite one or two instances.

I recall the case of a contractor who bid on small jobs of carpentering, stonework, bricklaying, excavation, etc. While not eminently successful, he made a good living; but later, desiring to take a larger contract, which included concrete work, of which he knew little, he formed a partnership with a man who had little experience in practical work but who had made a study

of concrete construction. This man knew the strength of concrete; he knew the proper proportion of gravel and cement for various classes of such work. In other words, he was well posted on the theory of concreting. The partnership succeeded because these two men POOLED THEIR RESOURCES.

I remember a man who worked in a street-paving gang. He knew more about paving than his employers; he figured their estimates, laid out their work, which was done in a workmanlike manner. He could not undertake such work himself alone, for lack of capital. Later he went into business with a man who had the capital but not the experience, and together they succeeded, because they POOLED THEIR RESOURCES.

Again, in the same brickyard, there were two foremen, both having equal authority. One of these men knew clay; he knew its nature and how to make it into bricks; he knew how to burn the bricks; but he was no judge of the bricks after they were burned. The other man knew little or nothing of clay and less of the burning of bricks; but he *did* know a well burnt brick when he saw one. He knew the quality and strength of burnt bricks. He could judge of these from their appearance, color and ring. He knew how bricks should be handled, stored and transported, and he had complete charge of this end of the work. These two men succeeded, also, because they POOLED THEIR RESOURCES.

In the same way, the practical man and the technical man can succeed in the mine, if they learn to coöperate. The mining industry has much to learn in this respect. By keeping our eyes open, our minds unprejudiced and profiting by observation, one can improve his own methods. Coal mining needs both the practical and the technical man, provided they are willing and able to POOL THEIR RESOURCES.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

MATTER

Definition—Matter is the tangible substance occupying space and endowed with properties that give to it form, motion and other distinguishing characteristics, by virtue of an all-pervading or impressed subtle force generally described as electrical.

Divisions of Matter—Until recently, the ultimate or smallest conceivable division of matter was assumed to be the **atom** (Dalton, 1808). Later researches of radio-active substances have developed the infinitely smaller particles which have been termed **"electrons"** (Stoney, 1891) and **"corpuscles"** (Thomson, 1897). The electron is assumed to be a minute particle of matter having a negative charge of electricity; and its mass is variously estimated at from $^1/_{1700}$ to $^1/_{2000}$ of the mass of the atom of hydrogen.

The chemical divisions of matter are the familiar **atoms** and **molecules.**

Properties of Matter—The universal attribute of all matter is that described as **"mass,"** which may be simply defined as amount of matter. By virtue of its assumed electrical state or condition, all matter is endowed with certain tangible and measurable qualities or properties, such as **weight, inertia, density, elasticity, cohesion, divisibility, impenetrability, expansion, contraction.**

Matter undergoes many changes but is absolutely indestructible.

Law of Attraction—The universal law of attraction is that every particle of matter attracts every other particle of matter, the force of attraction varying inversely as the square of the distance between the particles.

Terrestrial Attraction is the attraction that the mass of the earth exerts on the mass of a body. This is commonly called **"gravitation"** and the attractive force, the **"force of gravity"** or simply **"gravity."**

Form or State of Matter—All matter exists in one of three different forms, namely, **solid, liquid,** or **gaseous.** The same matter may pass from one form or state to another owing to a change in density.

Molecular State—The molecular theory assumes that all matter, solid, liquid or gaseous, in respect to its physical condition, is composed of molecules, each complete in itself. It is assumed that these molecules are subject to two opposite or opposing forces known as the **"molecular forces"** of attraction and repulsion.

Molecular Attraction, acting to bind the molecules of matter together, is in obedience to the common law of attraction in all matter.

Molecular Repulsion, acting to drive the molecules of matter apart, is the result of a state of incessant molecular vibration, which produces the effect called "heat."

The Coal Age Pocket Book

Solids—Matter in the solid state is characterized by a greater or less rigidity of its molecules. The force of molecular attraction is here stronger than that of repulsion, and the molecules are held in a firmer grasp.

Liquids—In the liquid state, the forces of attraction and repulsion are about evenly balanced, and the molecules move freely amongst each other.

Gases—In the gaseous state, the repulsive forces are in the ascendency and the molecules are driven so far apart that the density of the matter is reduced to that of a gas.

Liquids and gases are both **fluids,** which is a general term applied to any form of matter other than a solid.

Illustration—Ice, water and steam furnish a good illustration of how the same matter can pass successively from the solid to the liquid and gaseous states. In the passage from one state to another, there is no change in the matter itself, the difference being due to the heat condition of the mass.

In the passage from solid to liquid, or from liquid to gas or vapor, heat is given out; and, vice versa, heat is absorbed when a gas or vapor becomes a liquid, or a liquid becomes a solid. The change is thus a heat condition only.

Vapors and Gases—The term **vapor** properly describes the gaseous condition of most substances that, at ordinary temperatures, exist as liquid or solid; or a gas at or near its point of liquefaction. The term thus has a suggestive meaning of the possible liquid or solid state of the substance now in the gaseous state.

The term **gas,** on the other hand, is a general term that relates solely to the gaseous condition of matter; and is thus more properly applied to those substances that, at ordinary temperatures, exist as gas; although they may be liquefied or solidified by a decrease of temperature and an increase of pressure.

Thus, we speak of air, oxygen, hydrogen, nitrogen, carbon dioxide, methane, etc., as "gases," in contrast to steam (water vapor) and the vapors of such volatile liquids and solids as naphtha, benzine, camphor, and other similar substances.

Vaporization takes place at all temperatures; and, in many instances, a substance will pass directly from the solid to the gaseous condition, without becoming liquid.

Mass, Volume, Density—Since mass is amount of matter, the mass (M) of a body is the quantity of matter it contains, which is determined by the volume (V) of the body and the density (D) of the matter. The relation of these elements is expressed by the formula

$$M = VD$$

Then, considering a unit volume (V = 1), it is evident that the **"unit of mass"** is equal to the **"unit of density."** In other words, whatever is taken as the accepted unit or standard of density is also the unit and standard for the measurement of mass, which is the ultimate unit.

Inquiries of General Interest

Ignition of Firedamp by Signal Wires

My attention was drawn to the item on the ignition of firedamp by sparks from an electric bell, which appears in COAL AGE, June 13, p. 977. The article stated that a fatal accident in South Wales had been traced to the ignition of firedamp by sparks from an electric bell in use for signaling purposes.

The bell was described as an ordinary one of the trembler pattern, operated by an induction coil and a battery of eight Leclanché cells, which, when tested after the accident, gave a pressure of 11½ volts. The same item states that it was proved experimentally that sparks from the bell operated with current from the same battery would ignite an explosive mixture of coal gas and air, and that this mixture was later fired by sparks caused by rubbing a file across two wires connected to a pair of cells giving only 4 volts pressure.

The use of an induction coil with a battery of eight Leclanché cells for the operation of a trembler bell is a curious combination. Granting, however, that the circuit is to be opened at the bell, it would be gratifying to know what were the voltage and amperage delivered by the secondary current of this particular coil, under the working conditions, which must, of course, include the leakage of the wiring system and the inductive resistance of the circuit. It may be remarked, incidentally, that the pressure and strength of the current delivered at the point where the circuit was opened and necessary to produce an arc at that point, would depend on local conditions.

It would also be of interest to know if the statement at the close of the item, that an explosive mixture of coal gas and air was fired by the sparking of a current of 4-volts pressure from a pair of Leclanché cells, can be verified. It would be of the greatest interest to know if there are conditions under which mine gas and air, in any explosive mixture, can be ignited, that would seem to call in question the results of the tests made by the Federal Bureau of Mines.

I might add that *it is not possible to get discharges from Leclanché cells, at 4 volts, that will approximate the discharges at this voltage that are now recognized as being safe in the presence of mine gas.* It will be generally agreed that this subject bears an important part in determining the safety of electric mine lamps of all makes. Its thorough investigation would be of the greatest benefit to all concerned.

FRANCIS A. POCOCK.

Philadelphia, Penn.

In this connection, the article entitled "Gas Ignition by Electric Sparks," by W. M. Thornton, published in COAL AGE, Vol. 2, pp. 685, 722 and 796, will be of interest. Mr. Thornton, who is professor of electrical engineering, Armstrong College, Newcastle-upon-Tyne, England, has given much attention to this subject. In his article, Mr. Thornton shows that for the higher voltages, say 100 volts or greater, a current of a single ampere or less will suffice for the ignition of explosive mixtures of marsh gas and air; for lesser voltages, the current necessary for ignition of firedamp rapidly increases. He states: As the voltages are decreased below 50 volts, the current necessary to insure ignition, on the breaking of the circuit, increases very rapidly. Attention is also drawn to the fact that the metal of the terminals, whether iron, nickel or copper, varies the results.

Mr. Thornton adds: "It would appear to be impossible to ignite even the most explosive mixture of methane and air, by single-break sparks from a signaling circuit, at the maximum pressure of 20 volts allowed by the British Coal Mines Act. At these low voltages, electrical signaling may be used with safety in any part of a coal mine, provided that care is taken to prevent wires from remaining in contact and thus forming a short-circuit. Such a contact would cause the wires to become red-hot where they touch, but this is unlikely to occur." We shall be glad to receive further information on this subject. The subject of the influence of electrical currents, conducted into the mine, for power, lighting or for signaling purposes, upon explosive mixtures of gas or dust and air, is one of growing importance and should receive immediate and careful investigation.

A Surveying Problem

Will you kindly give the solution to the following question? I have a block of coal, in a seam pitching 28 deg. due south. This coal is opened by a gangway driven due east. At a certain point on this gangway, a heading has been driven 90 ft. to the rise. Owing to a heavy fall of roof which had closed the gangway, it is proposed to start a slant road from a point on the gangway, 200 ft. outby from the mouth of the heading. The problem is to determine the length and the grade of the slant road, such that it will intersect the heading driven up the pitch, at its face.

JOHN WILLINGHAM, Fireboss,
T. C. I. & R.R. Co., No. 4 Mine.

Belle Sumter, Ala.

The slant road forms the hypotenuse of a right triangle whose respective sides are the heading, 90 ft., and the gangway, 200 ft. The length of the slant road, measured across the pitch is then

$$\sqrt{200^2 + 90^2} = \sqrt{48{,}100} = 219.3\ ft.$$

The inclination of the seam being 28 deg., the vertical rise of the face of the heading above the gangway is

$$90 \times sin\ 28^\circ = 90 \times 0.46947 = 42.25\ ft.$$

Then, calling the grade angle of the slant road a,

$$sin\ a = \frac{42.25}{219.3} = 0.19266;\ \text{and}\ a = 11^\circ\ 06'$$

Since the tangent of this angle is 0.196, the slant road has a grade of 19.6 per cent.

Examination Questions

Questions for Examination of Mine Electricians*

Ques. 1—What is a miter gear?

Ans.—Two bevel gears of the same size, each cut on an angle of 45 deg.

Ques. 2—What is a consequent-pole motor?

Ans.—A motor having two field coils and four poles.

Ques. 3—What is a differential compound-wound motor?

Ans.—A motor with the series and shunt field connected in such a manner as to oppose each other.

Ques. 4—What is a horsepower and what is its electrical equivalent?

Ans.—A horsepower is the power required to raise a weight of 33,000 lb. through a vertical distance of 1 ft. in 1 min.; or a weight of 330 lb. through a height of 100 ft. in the same time. This is expressed as 33,000 ft.-lb. per min. Electrically, 1 hp. is equivalent to 746 watts.

Ques. 5—What is meant by the drawbar pull of a locomotive?

Ans.—The drawbar pull of a locomotive is its tractive force; or the force a locomotive exerts to pull a load along the track. This force is determined both by the power of the locomotive and the adhesive effect of its wheels to the rails, and is limited by either of these factors separately. In mining practice, the drawbar pull of a locomotive is commonly taken as one-fifth of its weight; and with ordinarily good track and rolling stock, the load hauled on a level road will be from eight to ten times the weight of a locomotive, or, say from 40 to 50 times its drawbar pull.

Ques. 6—Why does a compound motor race when the shunt-field circuit is broken?

Ans.—There are two conditions that may be explained as follows:

1. If the motor is running without load when the shunt-field circuit is broken it will race, for the following reason: A motor always tends to develop a counter-pressure in its armature almost equal to the impressed voltage, and this counter-pressure depends on both the speed of rotation and the magnetic field. Breaking the shunt current at once weakens the field and the motor speeds up in an effort to adjustment. This increase in speed is accompanied with an increase in counter-pressure, which, being opposed to the impressed voltage, still further weakens the armature and series-field current and results in a still further increase of speed, the action being cumulative, which effect, in electrical language, is termed "racing."

2. If, on the other hand, the motor is running under a heavy load when the shunt-field circuit is broken, it will likely stop for lack of sufficient torque to turn the armature. This causes, at once, a large drop in counter-pressure in the armature, and an excessive curent results, in most cases blowing out the fuses or circuit-breakers or, otherwise, burning out the armature.

Ques. 7—What is an interpole motor?

Ans.—An interpole motor is one having small poles between the main poles of the machine, the purpose being to reduce the field distortion and permit the motor to run at a higher speed with less danger of sparking at the brushes.

Ques. 8—(a) What is meant by the pitch of a screw? (b) What is the U. S. standard for a screw ½ in. in diameter?

Ans.—(a) In a single-thread screw, the pitch is the distance between two consecutive threads, center to center, measured in the direction of its axis. In a double-thread screw, the pitch of the screw is twice, and in a triple-thread screw, three times this distance. Always, however, the pitch of the screw is equal to the distance the screw advances or travels, in the direction of its axis, in a single revolution or turn.

(b) The U. S. standard for a screw ½ in. in diameter is 13 threads to the inch.

Ques. 9—Have you ever observed a motor start up in one direction and then reverse itself; and, if so, explain what would cause this to happen.

Ans.—When a compound motor is started under no load, the shunt circuit naturally takes the larger current; and if, through a faulty connection, it happens that the shunt and series fields are bucking each other, the motor will start to rotate in a direction determined by the shunt current, which, for a time, predominates. But, when the motor takes its load, the major current will flow through the series circuit, with the result that the direction of rotation will be reversed.

Ques 10—For what purpose are the grooves cut on an armature shaft, next to the bearing?

Ans.—The purpose of the grooves is to prevent the oil of the bearings following the shaft to the armature, as this would destroy its action.

Ques. 11—Assuming a motor having four poles and but two coils, should the connections be such that the current will traverse these coils in the same or in opposite directions?

Ans.—The direction in which a current traverses a coil determines the north and south poles of the magnet. It is necessary that these poles alternate as north and south poles in the magnetic field. In order to accomplish this, it is further necessary that the current should circulate about the coils in the same, clockwise or counter-clockwise direction.

Ques. 12—Would it be possible to operate a four-pole motor having two coils, with one of the field coils removed?

Ans.—The motor would probably continue to run, but its operation would give less satisfaction. The removal of one coil from a two-coil motor would result in the production of a less torque, while the speed of the motor would probably be increased.

*Note—The above questions have been suggested by Frank Walker, chief electrician of the Pine Run Co., Vandergrift Heights, Penn., as suitable for the examination of mine electricians, whom he says must combine both mechanical and electrical knowledge.

Coal and Coke News

Washington, D. C.

The long-expected decision of the Interstate Commerce Commission in the so called advanced rate case was delivered by the Commission on Saturday, Aug. 1, late in the afternoon. The report covers the whole question of advanced rates on railways as affected by the application of four years ago which was then refused, and as affected by the application which has been under consideration and is now settled.

It is an interesting fact that the rate decision in a number of cases refers to mining products and assigns them a treatment different from that accorded to other items of freight. In dealing with the application for higher rates, the report now delivered says, after reviewing the general character of the problem:

Protests against a general increase in freight rates were presented by the railroad commissions. Protests against proposed increases in rates so far as they affect specific articles, of which the tonnage in some cases is large, were presented by many shippers, and particularly by shippers of coal, coke, ore, brick, cement, lumber, ice, sand, gravel, paper, pulp, corn products and petroleum.

The commission reviews the merits of the argument quite fully and reaches the conclusion that the roads in eastern territory are not receiving a satisfactory revenue and that they ought to be permitted to obtain more through an increase in rates. The claim, however, is made that there is a good deal of difference between the New England territory, the Central freight association territory and other portions and that a different treatment in these is required. Dealing specifically with the question of an advance the commission exempts mining products from the application of higher rates, saying:

We have seen that the class rates in central freight association territory are on a lower scale than can be found elsewhere in the country and that many of the commodity rates are too low and are probably unremunerative, considering the diviserfied nature of the traffic. The class rates and many of the commodity rates may therefore with propriety be increased. This approval, however, is subject to the following limitations:

(a) With respect to certain heavy commodities, namely, brick, tile, clay, coal, coke, starch, cement, iron ore, and plaster, protestants made such a showing as to constrain us to hold that the carriers have failed to sustain their burden under the statute.

(b) Reference has heretofore been made to the fact that the proposed tariffs are based on a minimum increase of 5 cents per ton on all commodities moving under rates stated in cents per ton when less than $1 per ton; with respect to certain hauls, this would result in increases much in excess of 5 per cent. and in certain cases these would be as high as 50 per cent. The carriers have failed to establish the propriety of this minimum increase, and the evidence offered by the protestants makes it clear that it would work hardships and discriminations and cannot be approved, since under it a disproportionate burden is cast upon the heavy short-haul traffic.

There is an interesting point in the portion of the report which deals with those railways which are largely engaged in the carriage of mining products. Attention is called to the fact that the coal carrying roads are very prosperous and then to methods that may be employed by the railways in general for the purpose of economizing their outlays. In this connection attention is called to investigations not heretofore announced, conducted by the Bureau of Mines. The Commission says:

Fuel is, next to wages, the largest item in operating expense. The railroads of the United States report their aggregate fuel cost to be about $250,000,000 a year. But the actual cost is much greater; for the reported figures do not include, ordinarily, the cost of hauling the fuel on the lines of the carrier by which it is used. Furthermore, the cost of coal is increasing.

Much has been done in recent years by means of mechanical devices and otherwise to reduce fuel costs. Thus the Baltimore & Ohio since 1910 reduced its coal consumption 9½% per unit of freight traffic moved. But it has been demonstrated clearly that by knowledge and care on the part of employees and the management much greater savings can be made. With the assistance of the Bureau of Mines, questions were framed calling upon the carriers for details bearing upon this subject. Other investigations are being made by the Commission.

In closing the Commission says: "The contention of the carriers is that upon investments in property amounting to approximately $640,000,000 since 1910 no commensurate return has been made, and that the net operating revenue between 1910 and 1913 shows an actual decline. Additional capital cannot be expected on the showing made on the last increments of investment. . . . . It is not necessary to say that on such a showing the investing public will hardly be eager to entrust its funds to transportation enterprises."

Investigation in Illinois Fields

Additional information has been made public by the Interstate Commerce Commission with respect to the investigation it has lately been carrying on regarding the operations of railroads in the Illinois coal fields with regard to the control of coal deposits in their interest or in the interests of officers of the different lines. The Commission devotes special attention to the New York Central and its officers, giving a long detailed account of the operations of W. C. Brown, of the New York Central in connection with these lands and the companies which operated them. The central factor in the discussion is the O'Gara Coal Co. and the connection between that concern and Mr. Brown, of the New York Central. On this subject the commission after lengthy study says:

Neither W. C. Brown nor his associates can escape severe criticism for permitting these practices to exist. The Commission deems as significant the attitude of Mr. Brown and Mr. Carstensen in the matter of the payment to the O'Gara Coal Co. of the $60,000 rebate described elsewhere. In testifying before the Commission, Mr. Huddleston, the general auditor, took upon himself the entire responsibility of that transaction, and asserted that his superiors did not authorize or even have knowledge of the payments. Mr. Brown and Mr. Carstensen specifically denied any knowledge of the $60,000 rebate and appeared shocked that such conditions should prevail in their organization. A singular phase of the situation is that no one connected with the New York Central lines except Mr. Huddleston pretended that he had authority to make such a payment. . . . .

On various occasions the New York Central officials have had under consideration plans for the consolidation of all the coal properties in the Harrisburg district associated with the New York Central lines. Briefly, the plan contemplated that the Chicago & Harrisburg Coal Co., owned by the Big Four, would issue bonds guaranteed by that road and purchase from the latter its coal lands and from the Saline County Coal Co. and O'Gara Coal Co. their mines and lands. There was then to be formed an operating company, to which the mines and part of the lands would be leased for operation.

W. C. Brown and other officials testified that this plan never received serious consideration and in all probability would never be effected. It is worthy of mention, on the other hand, that in the latter part of 1913 the capital stock of the Chicago & Harrisburg Coal Co. was increased from $55,000 to $1,500,000, and that the company began taking over the coal lands owned by its parent firm, the Big Four Ry.

Whether this is the beginning of a gigantic coal proposition involving the purchase of the Saline and O'Gara properties, and based on the credit of the New York Central lines, the record does not disclose. Such a use of railroad credit for the private ends of favored individuals should obviously receive, if carried out, the severest condemnation of the law.

HARRISBURG, PENN.

The declaration of war against Servia by Austria-Hungary and the call to the colors of aliens in this country is likely to have a serious effect on the coal-mining industry of this state. Reports received here, some of sensational trend, go so far as to say the mines of the state will have to shut down. But many operators take no such view.

It is thought that but few mines will be vitally handicapped by the absence of those who will answer the summons to return and fight the battles of their native land.

In one district in the Wyoming region out of 8000 employees 222 are Austrians and 57 are Hungarians, or a total of 279, who might be subject to Austria's call; 283 employees are Russians and 3400 are Poles and Lithuanians, or a total of 3683, who are or have been under Russia's flag.

These figures make a grand total of 3962, or near 50 per cent. of the men employed in the one district, which is a fair estimate. On the face this would appear to bear a serious aspect, for if half of the men in the mines were to return home, and it might be said that these figures are fairly representative of both the anthracite and bituminous regions, surely the industry would be severely crippled and perhaps made helpless.

But a closer analysis is reassuring. In the first place, it is estimated that half these 3962 men are either naturalized or have taken out first papers. It is regarded as highly probable that a few of these will hasten to return, for the threat of exile to them will bear as stern a face as it will to those whose homes are still across the sea, and who have sent large

sums of money abroad and are afraid that the investments they have made in their native country will be impaired, if they do not answer the summons. With reference to the Austro-Hungarians, even the consuls admit that probably no more than 30 per cent. of these subject to military duty will obey the call to arms.

As to French and German miners the number is negligible. There are many Italians, in certain sections of the state, but there are no signs that many of them expect to leave. English and Welsh miners for the most part are pretty well Americanized.

The coal operators are not seriously concerned as yet over the possible scarcity of labor, for they doubt the prospects of facing any such wholesale departures as would come before suspension of operations would be necessary. It is estimated that at the most 15 per cent. of the mine employees are likely to abandon their places in the mines for the battlefield.

The European situation is not expected to have any direct effect on the market. Of course a general business depression superinduced by whatever struggle may be brewing would have the usual deteriorating influence on the demand for coal.

While it is not yet known to what extent war will effect the mines of the state, operators say the labor market will become acute if Russia makes a call. The subjects of the Czar outnumber those of Franz Joseph, these two countries having furnished a large portion of the coal-region immigrants for a number of years past.

PENNSYLVANIA

Anthracite

Forty Fort—The famous suit of the Trustees of the Proprietors of Kingston Township against the Lehigh Valley Coal Co. has been finally settled and the money paid over, the trustees now having over $100,000 in the bank. The use to which the money is to be put has not been determined, but it will likely be invested or kept at interest until two similar suits now pending are disposed of. One of these is against the Kingston Coal Co. for a tract in Kingston Township, and the other against the Lehigh Valley Coal Co. for a small tract in Forty Fort.

Pittston—Judge Garman handed down a decision on July 31, in the suit of Jacob McCollum against the Pennsylvania Coal Co., wherein he refused a motion for a new trial. McCollum was employed as a miner, and while working in a chamber was struck by cars pushed by an electric locomotive, was run over and sustained the amputation of one of his legs. He charged the company with negligence in that the locomotive was not properly equipped with a headlight, and that he had no warning of approach. At the trial McCollum secured a verdict of $5546. The court sustained this verdict.

Nanticoke—A mistake in the signals to stop the ascent of the carriage at the Bliss colliery of the Delaware, Lackawanna & Western Coal Co., on July 31, resulted in the heavy carriage being carried over the sheave wheel. The beams upon which this wheel rested were splintered and the shaft tower demolished. The colliery has been forced to shut down until the tower can be repaired which will probably take about 10 days. In the meantime the coal from the Espy tunnel and the Loomis colliery will be handled at the Bliss breaker, but the shaft will be out of commission.

Mahanoy City—The Philadelphia & Reading Ry. tracks at the west end of this city dropped out of sight on July 28, just before the arrival of a passenger train with four coaches and a pullman. Miners going home from work discovered the cave-in and flagged the train, causing great excitement among the passengers. The breach was caused by the roadbed falling into abandoned workings of the Tunnel Ridge mine. Some of these mines have not been operated for 20 years, and evidence of surface settling has often been noticed despite flushing.

Parsons—An effort is being made to induce the Delaware, Lackawanna & Western Coal Co. to donate to the Wilkes-Barre park system a piece of land along the Miners Mills road. This consists of about three acres, and is so situated that it is almost necessary for the city to possess in order to carry out its plan in connection with the improvement of Hollenback Park. The land in question is said to be of no particular value to the company, but would be of great value to the city.

Larksville—Operations were suspended on Aug. 1, for 10 days or more at Nottingham No. 15 colliery of the Lehigh and Wilkes-Barre Coal Co., in order that necessary repairs may be made to breaker machinery and inside pumps. The company machinists will push the work as rapidly as possible to the end that work may be resumed within the time stated.

Bituminous

Marianna—Marianna, which has been dull for some time, or since the closing of the mines and the bank, is regaining some of its activity. The mines have been reopened, and hundreds of men who were out of employment last winter and spring are at work, and prospects of a revival of business in the community are bright. Since the closing of the bank and the shutting down of the mines, business has been practically at a standstill.

Charged with having violated the bituminous coal-mining laws, Anthony Chievereno and Edward Jones, both employed at the Rachel mine of the Pittsburgh-Buffalo Co., were placed under arrest on July 31, and when arraigned waived hearings for court. The accusations against the men are made by C. F. Byrne, mine inspector of the 21st district. Chievereno was charged with carrying "the makings" for cigarettes and other smokers articles beyond a point in the mine where only locked safety lamps are allowed. Jones faces a charge of having passed a danger signal into a section of the mine where he should not have gone.

Fredericktown—George Hanko has brought action against the Vesta Coal Co. for damages to the amount of $10,000 for injuries sustained in the Vesta No. 5 Mine. Hanko sets forth he was employed as a track and road builder and was crushed by a motor driven by an inexperienced man. He also alleges that this motor had no headlight, and gave no warning of its approach. He alleges that the company made no provisions for safety holes and that he had not been given instructions as to danger.

Pittsburgh—D. W. Kuhn, and the Fidelity Title & Trust Co., of Pittsburgh, were, on July 30, named receivers for the Pittsburgh & Westmoreland Coal Co. The action, it was stated, was deemed advisable in order that the company might refund a note issue of $900,000, which was due Aug. 1. The company has a capital of $3,000,000 and bonds to the amount of $5,000,000.

Ebensburg—Certain Lilly (Penn.) residents and local union No. 1284 of the United Mine Workers of America have filed exceptions with the prothonotary at Ebensburg against the granting of a charter to the Miners, Laborers and Tradesmen's Union, of Lilly. They allege that those petitioning the charter constitute less than one-third of the total number of men employed by the Piper Coal Co., at Lilly. The filing of the exceptions is believed to be preliminary to an effort to adjust the differences which now prevent a settlement of the strike at the Piper mine.

WEST VIRGINIA

Charleston—The Winifrede coal mine resumed operation, July 30, after being idle on account of a strike since June 1. It had been intended to start this mine on July 27, but a delay was occasioned by a misunderstanding.

The case of the Lehigh Coal Co. operating mines near Morgantown in Monongalia County, against the Buckhannon & Northern Ry. Co., before the public service commission, was compromised by the parties interested and an entry of settlement has been made in the record of the commission.

Morgantown—The School of Mining at the University of West Virginia, is now an accredited training station for mine rescue and first-aid work. The school has installed considerable equipment for use in demonstration and in teaching rescue and first aid in connection with other courses. A class of five men were recently examined and passed and will duly receive certificates.

KENTUCKY

Mater—The Elkhorn Coal Co., of which J. H. Hall, Lexington, Ky., is manager, is making increases in its output and will soon be shipping a large tonnage. Increase in the working force was made Aug. 1. An additional 100 miners' houses are under construction.

Whitesburg.—Cincinnati people have begun a big coal development between Cornettsville and Viper, on the main line of the Lexington & Eastern in the Perry County field. Several hundred acres, it is stated, will be developed, including several timber areas. The promotors are, it is stated, to build a first class mining town at once.

Waverley.—The Drury Coal Co. has lost the case before the Interstate Commerce Commission, in which it sought to have the rate of $1.47 per ton on soft coal from its mines to Chicago held unreasonable. The Miles Brothers Co. asked the commision to change a rate of $1.15 per ton on coal from Kentucky points on the Straight Creek branch of the L. & N. to Chattanooga and lost also. The commission dismissed both suits.

OHIO

Cincinnati.—Operators are considerably interested in a plan involving the consolidation under one organization of the coal-distributing companies in Cincinnati, Cleveland, Columbus, Dayton, Toledo and other Ohio cities, with a capitalization of $10,000,000. It is understood that the com-

pany will be known as the Ohio Consumers' Company, and that it will have its headquarters in Cleveland. This is said to be the idea of a group of Chicago capitalists, who organized a similar combination in that city.

Columbus.—The Maynard Coal Co., which recently increased its authorized capital from $200,000 to $350,000, has absorbed two former subsidiary firms known as the Pomeroy Coal Co. and the Jackson Mining Co. The combined output of the mines now controlled by the Maynard Coal Co. is 2500 tons daily.

The Victoria Coal Co. has purchased an interest and has been appointed general sales agent for the East Kentucky Coal Co., of Torchlight, Ky. The general sales offices of the firm, in charge of Daniel H. Hitt, which were removed to Cleveland about a year ago have again been moved to Columbus, as it is found to be a more advantageous point. The concern has a number of mines in the Hocking and Crooksville districts.

INDIANA

Terre Haute—The demand for coal at Indiana mines is apparently better especially in domestic grades. The retail dealers in most cities which use the Indiana product are enabled to offer at lower prices than for several years in mid-summer and there is some response to this proposition

Clinton.—A cyclone recently blew down the tipple of Crown Hill mine, No. 1, owned by the Clinton Coal Co. The mine is about worked out and the remaining coal will be taken through neighboring mines.

Boonville.—Fire has broken out in the Warrick Coal Mining Co.'s mines east of this city. After unsuccessful efforts to extinguish the flames, a canal is being dug 30 ft. wide and a mile long around the burning mass. The fire started from a shovelful of hot ashes thrown on surface coal by an engineer. No attention was paid to the small blaze that sprung up.

ILLINOIS

Herrin.—The Oak Ridge mine, formerly of the Southern Illinois Coal & Coke Co., which was recently purchased by the Taylor Coal Co., is to be abandoned on account of the expensive upkeep, caused by squeezes and falls. This mine produced a coal that was recognized as a leader, throughout the Central West, on account of its quality.

Trenton.—For the past three or four weeks prospectors have been busy drilling test holes southeast and southwest of this place, in an effort to ascertain the thickness of the remaining portion of the Trenton vein. It is claimed that there are still several hundred acres of this coal in a body that can be worked.

Zeigler—A recent fire at the mine here caused operations to be suspended for practically two weeks.

MISSOURI

Rich Hill.—The Atlas Coal Co. has completed an 800-ft. well, which insures an adequate water supply in the future. The water is soft and especially suitable for steam purposes.

KANSAS

Mulberry.—The Clemens Coal Co. has purchased the farm of J. E. Lewis, near Mulberry, for $18,000 and is sinking drillholes preparatory to active development.

Frontenac.—The Jackson-Walker Coal & Material Co. has authorized the Whitmer Contracting Co., of Philadelphia, to operate a steam shovel and strip the coal on both sides of the Cherokee & Pittsburgh mine No. 15 west of Frontenac.

Pittsburgh.—Coal companies operating in the Pittsburgh field are much interested in the possibilities of making their land valuable from an agricultural standpoint. It is believed that the coal men could with little trouble grow enough fodder for their animals, instead of importing it or buying it on the market, as heretofore. The plan outlined will be thoroughly tested in Crawford and Cherokee Counties.

Topeka.—The state Public Utilities Commission settled the mine run coal case on July 28 by refusing to allow the operators to ship mine run at slack rates. The order of the commission allows carriers to establish screen specifications, providing in substance that slack coal rates shall apply on nut, pea, slack and screenings that will pass through a bar screen with 1⅝-in. openings, or through round holes 3-in. in diameter.

OREGON

Medford—A 13-ft. bed of high-grade semi-bituminous coal has been struck at the Little & Burr mine near this place. According to the owners this will mean the establishment of a new industry in the Rogue River Valley. The fuel contains but little sulphur, and will be well adapted to gas manufacture.

FOREIGN NEWS

Dordmund, Germany—Fifteen coal miners were killed July 28 by fire which broke out in the Hansemann Pit. Six of the bodies were quickly recovered.

Cardiff, Wales—The British Admiralty has notified the collieries warning them against shipping coal, and has furthermore sent out notification that all coal is liable to be taken by the Admiralty under emergency contract in which case inedmnity will be made for breach of private contract.

The executive council of the South Wales Miners Federation on Aug. 1, refused to acceed to the suggestion of the British Admiralty that the miners in the collieries supplying vessels of the navy should work on Aug. 4 and 5 which had been arranged as miners' holidays. The council took the ground that it was not necessary for defensive purposes for the miners to work, and declined to encourage British intervention in the European conflict.

PERSONALS

H. S. Wyly, formerly connected with the East Kentucky Coal Co., of Torchlight, Ky., has taken the position as traveler in Indiana with the Victoria Coal Co., of Columbus, Ohio.

Daniel F. Connor, general sales agent of the firm of Whitney & Kemmerer, has left New York for Marblehead, Mass., to join M. S. Kemmerer on his yacht the "Uinta" for a cruise on the coast of Maine.

Clarence M. Schwerin was elected president of the Vinton Colliery Co. at a meeting of the board of directors held at Vintondale, Penn., on Tuesday, July 28. Warren Delano was elected chairman of the executive committee at the same meeting.

W. C. Pollock, formerly foreman for the Sonman (Penn.) Shaft Coal Co., has been appointed superintendent of the Elkhorn Mining Corporation of Wayland, Ky., his place as foreman being taken by W. G. Strachan, who was formerly with the Elkhorn Mining Corporation.

Senator J. K. P. Hall, the well known bituminous operator has suffered a slight relapse. On July 29, he was able to walk about his room. Attending physicians are of the opinion he will recover, although his convalescing period will take several weeks. Senator Hall is in his 70th year.

John Berkheiser for many years inside superintendent for the upper division of the Scranton Coal Co., has partially severed his connections with that firm. Mr. Berkheiser will be succeeded by James W. Smith, of Peckville. He will, however, remain with the company in an advisory capacity.

John C. Neale has resigned his position as assistant general manager of sales and structural engineer of the Carnegie Steel Co., of Pittsburgh, Penn., to become president and general manager of the Central Steel Co., of Massillon, Ohio. John W. Dix has succeeded Mr. Neale with the Carnegie Steel Co.

OBITUARY

John P. Thomas, said to be the oldest miner in Missouri in point of service, died at Marceline on July 17. He was 75 years old, and had worked in coal mines in Wales, his native country, and the United States, since he was seven years old.

Thomas J. Pearce, of Portage, Penn., died July 30 at the Memorial Hospital, District No. 2, of the United Mine Workers of America. A native of England, Mr. Pearce came to Portage about 24 years ago, being a member of the firm of George Pearce & Sons Coal Mining Co., operating two mines, and employing 400 men. In addition to being General Manager of the above concern, he owned the Ivy Ridge Coal Co., was president of the River Mining & Manufacturing Co., of Virginia, and president of the Forest Hill Coal Mining Co., of Johnstown. His death followed an attack of appendicitis from which peritonitis developed, and which an operation failed to relieve.

CONSTRUCTION NEWS

South Bethlehem, Penn.—A new 500-ft. additional extension is being made to the coal storage plant of the Lehigh Coke Co. at this place.

Lexington, Ky.—The Commonwealth Coal & Timber Co., recently organized in Lexington, expects to begin within the next few weeks, some important development projects in Letcher and Perry Counties.

Bakerstown, Penn.—The Sterling Coal Co. and the Bakerstown Land & Improvement Co. anticipate the construction of a new machine shop, 10 new houses, and the installation of new electrical equipment some time early this fall.

Oscaloosa, Ky.—The Valley Creek Lumber Co., with headquarters at Rochester, N. Y., has purchased an additional 1000 acres of coal and timber properties. It will develop the timber tracts, and lease the coal for early development. The property lies near the Lexington & Eastern Railroad.

Hazard, Ky.—The Middle Fork Coal Co., of which C. G. Bowman is president, and which was recently organized, announces the early beginning of a large development of coal properties near Bullock, three miles above Hazard, on the Louisville & Nashville railroad. This firm will have an output of about 1800 tons daily.

Colver, Penn.—Contracts have been let for the erection of 40 new houses in Colver. A new two-story brick building which is to house the post office has also been ordered erected. The houses are to be of a superior style of construction. They will be of wood and will contain six rooms, with all modern improvements. The new Presbyterian Church is nearly completed and will soon be ready for dedication.

Earlington, Ky.—Work is proceeding rapidly on the Victoria Coal Co.'s development of its mine No. 9, several hundred yards north of the present workings. This shaft will be 300 ft. deep and with the air shaft will require several months to complete. Frank D. Rash, president of the company, and the other officers and stockholders at a recent meeting perfected plans for reorganization, but these plans have not been given out.

Finleyville, Penn.—Work at the new coal shaft at Coon Island is progressing steadily. The shaft is being cemented to a depth of 85 ft. As soon as this work is finished excavations will be resumed and the shaft sunk to a lower level when another stop will be made for concreting. Arrangements are being made for the erection of 40 four-roomed houses. A spur has been built from the Baltimore & Ohio railroad to the new works, which are located on the south side of the main line and in plain view of the travelers on the old National road.

NEW INCORPORATIONS

Knoxville, Tenn.—The Big Emory Coal Co., with an authorized capital of $50,000, has been incorporated here, the incorporators including C. W. Henderson, C. M. Thomas, W. S. Bobinson, A. H. Bowling and Harry R. Smith.

Huntington, W. Va.—Notice of the dissolution of the Island Creek Fuel Co., which was recently given by the attorneys of the United States Coal & Oil Co., has no significance particularly as the Island Creek Fuel Co. is an old holding firm and no operations have ever been carried on under this name.

Winding Gulf, W. Va.—The Stone Coal Co., has been organized with a capital of $25,000, all of which has been subscribed and $2500 paid in. This firm is privileged to buy lands in Raleigh County, build and operate railroads, electric, power and telephone lines, operate coal mines, etc. The incorporators are E. C. Minter, B. E. English, and H. A. Minter, of Winding Gulf, Jesse E. Oliver, and Joe L. Smith of Beckley, and G. A. Hinterleigner of Affinity.

Richwood, W. Va.—A charter has been issued to the Beaver Coal & Timber Co., with chief works located at Richwood. The object of the incorporation is the acquisition of coal, oil, gas, and timber lands, the development of the same, and the manufacture and sale of their products. The authorized capital stock is $100,000, of which amount $500 has been subscribd, and $100 paid in by the incorporators, who are G. H. Odell, J. W. Odell, E. D. Crawford, J. E. Crawford, and W. L. Ashby.

INDUSTRIAL NEWS

Columbus, Ohio.—The contract to supply 15,000 tons of coal to the Ohio State University has been awarded to the Victoria Coal Co. on a B.t.u. basis. The coal will be furnished from the Sedalia mine.

Tamaqua, Penn.—The Panther Creek valley washeries of the Lehigh Valley Coal & Navigation Co. have suspended operations indefinitely. This close down is attributed to the poor demand for washery coal.

Philadelphia, Penn.—The United Gas Improvement Co., of Philadelphia, is reported to be in the market for its annual supply of coke, amounting to approximately 250,000 tons. It is said also, that the Reading Coal & Iron Co., has contracted for about 20,000 tons of furnace coke.

Columbus, Ohio.—The announcement is made by the officials of the Chesapeake & Ohio R. R. Co. that the new line to be built to connect Portsmouth and Columbus will carry passengers as well as freight. The original announcement was that it would be a freight line exclusively.

Jefferson City, Mo.—The Western Coal & Mining Co. of St. Louis, owned and controlled by the Goulds of New York, recently secured the contract to furnish 25,000 tons of coal to the penitentiary for use the ensuing year, at $2.55 per ton delivered. The highest bid was $2.90 per ton for the same grade of coal.

Columbus, Ohio.—The Columbus Coal Exchange of Columbus, Ohio, has been organized by the local retailers for the purpose of fighting trade abuses. It is proposed to ask operators to refuse to sell to "snow birds" and consumers directly. Other trade abuses will also be taken up and the matter of establishing a credit bureau is being seriously discussed.

Columbus, Ohio.—A new phase of the application of the Ohio mine-run law has appeared. This is in reference to lands leased for coal which are always paid for on the basis of the coal mined. These leases are all on the screened coal basis. Since the new law provides that all coal must be weighed this eliminated the screened feature and thus a new basis of settlement must be devised.

New York City—The Terry Steam Turbine Co., with works at Hartford, Conn., announces the appointment of Fimdanque Bros. & Son, of New York and Panama, with main office at 15 Whitehall St., New York, as its representative for the Republic of Panama and the Canal Zone. The Cleveland office of the Turbine company in charge of L. G. Finlay, has been moved from 710 New England Bldg., to 503 Union Bldg., Cleveland, Ohio.

Connellsville, Penn.—W. H. Warner, president of the W. H. Warner Co., a large operating and selling corporation of Cleveland, Ohio, recently negotiated the purchase of 262 acres of coal in Washington County, about 6 miles from Charleroi, along the Monongahela River and within reach of the Monongahela Division of the Pennsylvania R. R. The price paid ranged from $900 to $1100 per acre, without the surface rights. This was for the Pittsburgh seam only, the Freeport vein being reserved by the sellers.

Springfield, Ill.—The State Civil Service Commission, of Illinois, will hold an examination at Springfield, on Sept. 5 next, to provide an eligible list of persons qualified to act in the position of assistants to the three mine rescue stations of the state located at La Salle, Springfield and Benton. This examination which will be entirely oral and thoroughly practical will be held in the mine rescue station in Springfield before a competent board of examiners. The salary limits are $75 to $100 per month, and the age limit is between 21 and 50 years. Several vacancies for these positions now exist.

Pittsburgh, Penn.—It is stated that a pronounced impetus has been imparted to the coal business of the Pittsburgh and West Virginia districts as a result of the impending European war. West Virginia companies took heavy contracts to supply coal to the Italian and Egyptian governments early in May, and orders have been received to hurry shipments in order that cargoes might be landed before serious hostilities had begun. Hurry orders were also received from across the Canadian border. While Nova Scotia produces coal in abundance, the distance to the cities and ports on the St. Lawrence River in the provinces of Ontario and Quebec is so great, that coal from West Virginia and Pennsylvania is shipped there. For purposes of coast defence in case of serious hostilities, it will be necessary to have a supply of coal at available points, consequently the hurry orders above mentioned.

Coal Trade Reviews

General Review

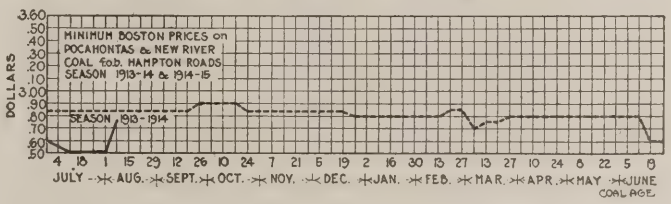
Anthracite operations heavily restricted. European wars disrupt routine business on the Atlantic Seaboard. Market technically strong but subject to many disturbing influences. Middle Western situation improving.

Heavily curtailed operations in the mining regions and large cuts in the circular by individual producers, continue the predominating features in the hard-coal trade. The temporary spurt at the close of last month, due to the regular advance in the price schedule, has disappeared and with the possible exception of some increase in Lake shipping, the business is flat and devoid of any interest. Fears are expressed in some quarters as to the possibility of a labor shortage as a result of the European war. While it is true that the rank and file of our mining population is largely foreign born, conservative observers do not believe the migration will attain sufficient proportion to prove a serious menace to the coal industry.

The Atlantic seaboard bituminous trade is rather more unsettled as a result of the European controversy. The almost complete cessation of exports in lines dependent upon the coal industry, as well as in the industry itself, have so disturbed routine business that producers are showing a disposition to hold off pending further developments. Poor collections and more stringent regulations of credit as a result of the worldwide liquidation of securities of all sorts, is another important factor in the situation. As a rule very little business is being negotiated. Operators are rigidly curtailing production down to immediate requirements, while the circulars are firmly maintained as a rule. Some few tonnages have accumulated at New York as a result of the cancellations of shipping, but these are by no means excessive. The trade is in a technically strong position and will respond rapidly to any expansion in general business.

Pittsburgh district prices continue irregular on both spot and contract business, while Lake shipments are still unsatisfactory and the line trade only slightly better; definite indications of increased activity and improved sentiment in the iron and steel industries are the best features of the current situation. As a rule no important developments are anticipated before the fall trade opens up, although isolated buying from unexpected quarters is regarded as significant of the trend of conditions. With some of the Ohio mines now under operation and others resuming as rapidly as possible, a more optimistic feeling prevails in the trade there. Steam consumers, now dependent upon West Virginia mines are showing a disposition to swing back to the Ohio product and contracts are being negotiated on a profitable basis.

The southern situation has not experienced any change with the possible exception of some increased inquiries for lump coal, and a slight stiffening in the steam prices. A substantial improvement is noted in the Middle Western domestic grades, while the steam fuels are weak with every indication of continuing so, unless there is a sharp increase in the industrial consumption. The Ohio coals are still out of the market while there is considerable buying for storage purposes and the beneficial effects of the large crop will soon be in evidence.



ATLANTIC SEABOARD

BOSTON

Pocahontas and New River shippers marking time but the outlook is favorable. Market coal eliminated. Pennsylvania grades steady as to price with some gain in tonnage. Georges Creek in excellent position with prices still firm. War scare causes some speculation as to effect on mineworkers.

Bituminous—Pocahontas and New River are very dull. That the shippers are marking time, however, instead of forcing shipments on a demoralized market is a great improvement, because of the extremely quiet situation. A rigid curtailment is in effect in most of the West Virginia districts and this week the last of the market cargoes was disposed of. Schooners, barges, and steamers are all in plentiful supply and rates from Hampton Roads are as low as at any time in three or four years. F.o.b. sales, so far as reported are strictly on the $2.85 basis; on many sides there seems a disposition to go easy until the market tones up. That September will develop a wholesome situation for the Southern coals is now freely predicted.

Although the Pennsylvania grades have not yet shown any increase in price there are many signs of buying power. Contractors are showing interest again and while the gain is very slight there is no doubt the market is already on the mend. The quality grades are naturally the first to feel the benefit but a comprehensive improvement is counted on with the approach of September. Those buyers who cannot credit a permanent settlement of Hampton Roads price difficulties are calling for moderate supplies of Cambria coals, for instance, and this has a steadying effect on all the grades moving into Philadelphia and New York.

The Georges Creek shippers are well supplied with orders for several weeks and the price list is as strong as ever. The movement of the fleet in July was up to the maximum and there is now no uneasiness over the outlook. The demand for all-rail is also improving.

Anthracite—The trade is almost featureless. The mines were under suspension several days in July and consequently there has been some delay in loading cargoes at New York, particularly when requisitions called for a proportion of stove. A few dealers are taking seriously the alarmist reports that Pennsylvania will be emptied of skilled miners by reason of summons to help their native countries in the war. This is not a feeling that is at all general, however, and in all probability there will be nothing to start anthracite moving in better volume until stocks have been worked into by the consumer more than they have thus far. Dock screenings are still in good demand.

Bituminous prices at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*.....	$0.90@1.45	$1.20@1.65	$1.67@1.77	
Philadelphia*.....	2.15@2.70	2.45@2.90	2.92@3.02	
New York*.....	2.45@3.00	2.75@3.20	3.22@3.32	
Baltimore*.....	.....	.....	2.85@2.95	
Hampton Roads*.	.....	.....	.....	$2.75@2.85
Boston†.....	.....	.....	.....	3.58@3.65
Providence†.....	.....	.....	.....	3.68@3.78

* F.o.b. †On cars.

NEW YORK

European wars and uncertainties in the financial situation causing a contraction in the bituminous trade. Considerable inquiry from foreign governments. Anthracite quiet and further restrictive measures put into effect.

Bituminous—The already flat situation prevailing in the New York soft-coal market for the past few months, has been further accentuated by the European wars. At the present moment the severest strain is felt in the monetary situation. The heavy liquidation of securities of all classes has created such a tense situation in financial circles that banking interests are placing severe restrictions on loans with the result that collections are bad, and sellers are disposed to require unusual protection. Marine business is at more or less of a complete standstill pending a re-adjustment to the new conditions.

Particular interest is felt in the bunkering and export trades. With the Berwind White Co. refusing any information on this subject beyond issuing a statement that "conditions are normal" there is little data to be had. Outside rumors are current to the effect that the Berwind Co.'s storage facilities at tidewater were congested with about 40,000 tons of coal early in the week. Considrable inquiry is reported generally from foreign governments. Local companies are inclined to scrutinize credits on such business carefully.

Shipments to tidewater have been vigorously curtailed of late, so that the market was in a strong position in this respect, but the disruption in export business will no doubt result in accumulation of demurrage coal, for the time being. A temporary slowing down in the industries dependent upon export trade will be inevitable, but it is generally felt that they must shortly feel the increased call from foreign countries for American commodities.

The market is not quotably changed from the past few weeks which we continue as follows: West Virginia steam, $2.50@2.60; fair grades Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The exports of hard coal being practically nil, the market has experienced no change with the possible exception of a contraction in credits. The companies are still stocking chestnut while the individuals are offering substantial concessions in order to move it. The first of the month activity helped egg and stove coal, particularly the latter, but the market has again relapsed back into the former dullness. Some line demand for egg and stove is noted, but there is no call for nut in any direction. With firmer water rates prevailing to down east points, and purchasers well supplied for the time being, there is a tendency to stop buying pending a break in the water freights.

On the steam grades few concessions are offered on high grade pea coal, but the off qualities are available at substantial cuts. The Nos. 1, 2 and 3 high grades of buckwheat are in short supply due to restricted operations at the colliers where these are produced; the lower grades are offering in large tonnages, at from 25 to 50c. off the prevailing circular.

In view of the tight situation in monetary circles, the coal men are becoming exceedingly careful about who they sell and are showing a disposition to require satisfactory guarantees as to payments. Reports were current early in the week that further restrictions would be put into effect.

The market is now quotable as follows:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.00	$4.60@5.00	$4.95	$4.55@4.95
Egg	5.25	4.90@5.25	5.20	4.85@5.20
Stove	5.25	5.15@5.25	5.20	5.00@5.20
Chestnut	5.50	4.95@5.50	5.45	4.75@5.45
Pea	3.55	3.40@3.55	3.50	3.25@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	1.90@2.75
Rice	2.30	2.15@2.30	2.00@2.25	1.50@2.25
Barley	1.80	1.60@1.80	1.75	1.25@1.75

BALTIMORE

Bituminous and anthracite are both extremely flat with little prospect of any immediate change. Much speculation as to effect of European war on the export trade.

A feeling of inertia hangs over the coal trade. Outside of that moving on contracts, the past week saw little or nothing doing. New business is so infrequent as to be negligible. Railroad movement from mines to tide is considerably better, but it is now a question of getting buyers at terminal points. More of a surplus was noted about the piers and terminals the past week than for a long time past.

Depressed conditions are partly due to the uncertainty of the export coal trade; some of this coal was released on the market due to refusals to charter. Occasional foreign charters are being made, but there was a notable lack of any movement to the French points that have recently been taking American coal. What the effect of the complete withdrawal of Welsh coal will have on the marketing of the product of this country, is one of the uncertainties of the hour as created by the general war scare in Europe.

Prices of fuels for domestic use have undergone little or no change, and it is hard to set a price when so little trading is going on. In West Virginia three-quarter gas was offering at from 80 to 90c., run-of-mine at 70c., and slack at varying prices from 55c. upward. Pennsylvania line coals in some cases sold as low as 95c. to $1, with better grades at from $1.15 to 1.35, with very little selling of the best fuels.

Export figures for July as announced by the Custom House showed a total shipment from the Baltimore piers of 87,265 tons.

PHILADELPHIA

No improvement noted in the anthracite trade. The heavy curtailment an index of existing conditions. No immediate change looked for. Bituminous still flat, with very little spot demand, and prices on a parity with last week.

Anthracite—There has been no apparent change in the anthracite situation. Curtailment at the mines still continues with the output at about 50% capacity. At the present time, there seems to be a slightly better call for egg size. Broken is well taken up on contracts, and with curtailed production, the junior sizes, with the possible exception of pea, are moving off. Outside of chestnut and pea, the market is absorbing practically the entire output under restricted mining, and continued efforts are being made to increase the market on these sizes. While it is not felt that the European war troubles will effect the labor situation to any appreciable extent, at the same time speculation is rife as to what this will ultimately result in. Many of the foreigners in the anthracite regions still owe allegiance to foreign countries, although little fear is expressed that the exodus will have any appreciable difference on the production of either anthracite or bituminous coals.

Bituminous—Trade is still flat in the bituminous industry. Spot coal is seeking a market, and prices realized are far from satisfactory. Operators generally believe that both demand and prices will improve within the next month or six weeks. Considerable accumulation of coal is reported at tidewater, but this is all likely to be disposed of as soon as vessels or barges can be secured. Refusal to entertain propositions to contract at the current prices is still the position taken by the operators ,who apparently are strong in their contention that the fall will see an improved demand. Purchasing agents are shopping around, and are able to secure their requirements, at considerably less than contract quotations.

CHARTERS

Coal Charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tonnage	Rate
Queenswood [2]	British	Cardiff	Bermuda	1694	$1.68
Iona Tunnel [1]	.....	Philadelphia	Cay Francis	1118	1.90

Pendleton Sisters [1]	.....	Philadelphia	Calais	899	1.10
Eagle Wing [1]	.....	Philadelphia	Boston	1076	0.60

[1] Schooner [2] Steamer

HAMPTON ROADS

Movement of coal from Hampton Roads still light. Dumpings for month of July 929,956 tons. Accumulations at tidewater continue above normal. Some price cutting.

The dumpings for the week have been light although some large cargoes have moved to Boston and other New England ports. Export shipments have been few, the Italian market taking the largest percentage of the business. Shipments foreign have been to Genoa, Venice, and Para with one cargo to Luderitz Bay, South West Africa. This latter cargo was taken by the sailing ship "Timandra" while the other foreign shipments went by steamers.

Coal accumulation at Hampton Roads railway yards is still above normal and while vessel tonnage about due will considerably reduce stock on hand shipments coming forward will still keep the supply above normal. Demand on all grades is light and little spot coal is being sold.

Regular circular prices are still being quoted although it is believed some of the smaller suppliers are making some cut in order to move some tonnage in the railway yards.

Dumpings for July, while falling somewhat behind those of July, 1913, are considerably heavier than was expected. The total dumpings for the month were: Norfolk & Western Ry. at Lamberts Point 448,295 tons, Chesapeake & Ohio Ry. from Newport News 264,870 tons and the Virginian Ry. at Sewalls Point 216,791 tons. Both the Virginian Ry. and the Norfolk & Western have fallen below their figures for July, 1913, while the Chesapeake & Ohio Ry. shows a fair increase.

LAKE MARKETS

PITTSBURGH

Rumored negotiations for 1915 supplies for byproduct coking plants. Demand slightly improved. Prices still very irregular.

It is reported that there are some tentative negotiations looking to 1915 coal contracts for byproduct coke ovens, but it is not likely any business will be closed in the very near future. Lake shipments continue unsatisfactory, though there are hopes of improvement by the middle of this month. Line trade has improved slightly, partly by further exhaustion of stocks and partly by increased manufacturing activity. The iron and steel industry has operated as well in July as in June, which is unusual, and expects materially heavier operations in August, with an increase of perhaps 10% over July and a similar increase in coal consumption.

Prices continue very irregular, not only for free coal but also for contract coal. Slack, however, continues to show

the firmer tone noted a week ago, and is quotable at 60@65c. for prompt lots. Regular circular prices, which are entirely nominal at this time, remain: Slack, 80@90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in., $1.50, per ton at mine, Pittsburgh district.

BUFFALO

Bituminous a trifle better at occasional points. No higher prices anticipated yet and may not come till winter. Anthracite helped by end of the month rushes but otherwise unchanged.

Bituminous—Here and there a well-received jobber finds that a few good orders are coming, but the rule is that they are difficult to find. This is encouraging, however, as changes for the better have to begin in that way. It will probably be cold weather before the demand is really good. Even then the mines have so much more capacity than is used now that it would be easy for a long time to keep ahead of any improvement in the demand, no matter how fast it appears.

There is every effort to keep the coal trade in hand as much as possible. Some of the mine owners occasionally ship a few cars into territory where some good salesman is well known and then invite him to sell them. There is hardly the former amount of coal selling at low prices, which is a move in the right direction, though the people who sell unbought coal for their friends do not pretend to get as much for it as they do for their own. Quotations remain on the basis of $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack. Allegheny Valley sizes are about 25c. less. Slack is doing better. The large amount of it from points beyond Pittsburgh is often what makes the mischief, especially as it is not very high grade.

Anthracite—There has been a better long-distance trade in anthracite to finish the month, as is usually the case. A good salesman can dispose of a cargo in the Lake district at such time, to save the 10c. a ton, when he could not sell it at all, early in the month. The movement of anthracite by Lake is heavy, being 178,000 tons for the week and 810,410 tons for July, which is 30,000 tons more than in July last season. The shipment for the season is 2,219,735 tons, as against 2,566,606 tons to date last season. There is very little local demand for coal.

TORONTO

Market dullest for a long time. Acute situation developed by the war scare fails to create any buying.

Trade continues quiet, the demand for steam coal being smaller than it has been for some years. Notwithstanding the general anticipation of a speedy rise in price owing to the war, few are buying ahead of immediate necessities. Prices remain as follows with occasional shadings in car lots by jobbers in bituminous: Retail—anthracite, egg, stove and nut, $7.50; grate, $7.25; pea, $6.25. Bituminous, steam, $5.25; screenings, $4.35; domestic lump, $6; cannel, $7.50; wholesale, f. o. b. cars three-quarter lump, $3.68, screenings, $2.64.

TOLEDO

Situation unchanged but an excellent undertone prevails. Industrial conditions improving rapidly. Labor situation clearing up.

Toledo has shown little change, save for the usual raise in prices Aug. 1. Business is coming in about the same and the Lake shipping has shown no particular betterment. But despite all this, dealers are predicting improvement as soon as the weather is a little cooler. Notwithstanding the fact that all orders have to be dug up by persistent work, business generally is on the up grade.

The influence of the heavy crops is already noticeable. The railroads have begun placing orders for new rails and equipment, and placing idle shops in operation getting ready for the heavy traffic due within a few weeks. Industrial concerns are increasing operations and there is a general quickening of business. During the past week the increase in operations at the steel plants has amounted to 5 per cent. as compared with the previous week's average.

COLUMBUS

Mining is being resumed in the Hocking, Pomeroy, Jackson and Cambridge fields. Sales agents report a good demand for both steam and domestic sizes. Lake trade will also be active.

With the working agreement in most of the Ohio districts adjusted, mining will be resumed in many places early in the month; in fact quite a few mines opened Aug. 3 and others are being put into operation as rapidly as possible. The situation is correspondingly better and coal men expect a fairly busy season from this time on.

Steam demand is gradually increasing and salesmen have been started out for orders. While many of the steam users have been depending on West Virginia coal, they are expected to switch back to Ohio product as soon as mining is resumed. A few contracts for steam grades have been made and others will be closed within the next few weeks.

In the domestic trade there is some activity developing also. Dealers' surpluses are quite small and since they are moving larger quantities they have been compelled to replenish stocks. There is a marked preference in this market for the fancy grades such as Pocahontas and re-screened varieties but Hocking Valley is also still in demand. Retail prices advanced on the average of 25c., Aug. 1.

Lake trade is expected to take on more activity with the resumption of mining. Chartering of boats is going on rapidly and it is expected that Ohio will furnish quite a tonnage to the head of the lakes before the close of navigation. Dock prices are the same as last year. Reports from the Northwest show that the docks are not at all congested. Th Toledo docks of the Hocking Valley Railway Co. have handled 1,193,000 tons since the opening of navigation.

Prices in the Ohio fields:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Rescreened lump	$1.60		$1.65	$1.50
1½ inch	1.50		1.50	1.50
¾-inch	1.30	$1.20	1.35	1.30
Nut	1.25		1.35	1.15
Mine-run	1.15	1.05	1.15	1.10
Nut, pea and slack	0.70		0.75	0.65
Coarse slack	0.60	0.60	0.65	0.55

CINCINNATI

Temporary activity in the steam market preceded the circular advance of August, and a slightly improved domestic demand is felt. Lake traffic is comparatively slow, with plenty of boats available. Outlook regarded as very favorable.

The fact that prices for August delivery were scheduled for an increase, resulted in an improved demand during the last week of July, a number of contracts being closed and the movement of spot coal, better than for some time. But in all essentials the situation here remains unchanged, the slight improvement in the industrial field having as yet brought no marked increase in the consumption, while in the domestic market the same state of indifference on the part of the dealers and public alike exists as heretofore When this disappears later on, as it certainly will, there will be difficulty in supplying the demand, but so far this consideration has had little, if any, effect on the trade.

CLEVELAND

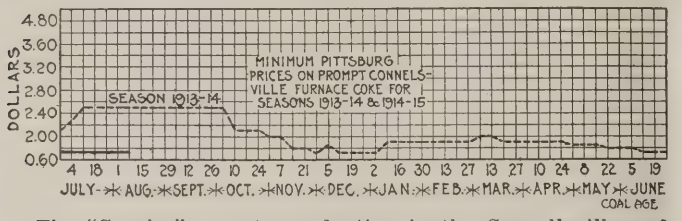
An improvement in retail and out-of-town demand noted. Heavy shipments of slack have created a light demand in Cleveland proper. The Lake trade is again showing signs of improvement.

Following heavy receipts of slack, amounting to as much as 100 cars a day, there is very little demand for fine coal. Receipts over Sunday were not as large as the average for last week and though the market is slightly lower it is not so weak as would be expected under the circumstances.

Out-of-town trade is inquiring for coal and orders for all grades are being taken for shipment, as soon as Ohio mines are at work. Hocking and Cambridge districts are shipping Lake coal and some of these grades are being sold in the all-rail markets.

The retail trade is taking more Pocahontas and anthracite. Owing to the small demand for slack, prepared sizes are held firm and in some cases lump and egg are quoted as high as $2.35 to 2.50 at the mines. Only a limited number of companies are taking orders at the circular. Those who are quoting higher prices claim to be well sold up. Operators are offering 1¼-in. Youghiogheny at $1.50 at the mines, but it is understood sales at $1.35 to 1.40 are being made.

The Lake trade is showing some signs of improvement. With all districts at work except No. 8, other coals are beginning to show greater tonnage. Docks are sending a little more fuel forward and, as Upper Lake docks are relieved, shipments from lower ports are increased. The incease is not particularly noticable as yet, but shippers expect it to be considerably improved by the end of the month.



Quotations are as follows:

	Pocahontas	Youghiogheny	Fairmount	W.Va. No. 8
Lump	$3.60			
Lump, 1½ in.		$2.50		
Lump, ¾ in.		2.20@ 2.25	$2.05	$2.05@ 2.10
Egg	3.60			
Mine-run	2.60	2.15	1.95	2.00
Nut		2.20		
Slack	2.20@ 2.35	1.65	1.70	1.60@ 1.65

COKE

CONNELLSVILLE

The month-end brought no demand for furnace coke, and it is evident that all consumers are covered for July and August at least. At the beginning of July there was $1.75 coke available for the two months, if not for three. Prior to that time a number of contracts for second-half had been made. About the middle of May there were three or four contracts at $1.85 and 1.10, while about the middle of June three contracts were closed for coke at $2, this, however, being for an exceptionally desirable brand. There are rumors that considerable prompt coke could be had at less than $1.75. We quote: Prompt furnace, $1.75; contract furnace, $1.75@2; prompt foundry, $2.25@.35; contract foundry, $2.35@2.50, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended July 25 at 268,290 tons, an increase of 90 tons, and shipments at 267,361 tons, an increase of 8599 tons. Production appears to have exceeded shipments in the week by 929 tons, while the accumulated excess in 18 weeks appears to have been 53,032 tons.

BUFFALO

There is no stir reported anywhere, and not much encouragement to sell. The demand is not improved and dealers seem quite discouraged. One reports that he has as much difficulty in selling a car of coke as he did in half a dozen cars of coal. It seemed as if the less a consumer bought the more time he had to complain of it. Quotations remain on the basis of $4.25 for best 72-hr. Connellsville foundry and $3.25 for stock coke.

DETROIT

There are signs of an improved demand for coke on this market. Connellsville has been as low as $1.90 but is gradually advancing and is now being quoted at $2.15 for prompt delivery. Semet Solvay is quoted today at $3.25 and gas house at $2.75. There is little or no demand for the latter.

CHICAGO

Furnace and foundry coke have not advanced as rapidly as was expected as the betterment in the iron and steel trades has not been as marked as was anticipated. Connellsville and Wise County are quoted at $5; byproduct, egg, stove and nut, $4.75; gas house, $4.25.

ST. LOUIS

There is no coke moving in but there is a good demand for the local product. Gas house is quoted at $4 f.o.b. St. Louis and retails at $5.75.

BIRMINGHAM

This week has brought no change in either the furnace or foundry coke market. There is some foundry coke moving at satisfactory prices, but the tonnage is not large, consumers buying only for their immediate requirements. There is nothing doing on furnace coke.

SOUTHERN

BIRMINGHAM

Lump coals show a slight improvement but steam grades are unchanged from last week.

This week has brought about a slight change for the better in the lump coal market. Prices have remained about the same but inquiries are more numerous and for larger tonnages although the movement has not increased yet. The steam-coal market shows very little change; the demand is far below normal, and prices, in many instances, have declined below the usual base. It is stated that many of the larger railroad contracts are being closed at a lower price than last year. The prospects for a better demand and prices are very good, and business should be greatly improved within the next 30 days.

LOUISVILLE

Considerable stocking for the winter and the trade is notably stiffer. Steam grades also in better demand.

A stiffening all along the line is reported by operators and dealers at the beginning of August, with prices, averaging ten cents higher on practically all grades. Extensive rains helped the demand from the interior points, where the farmers are putting in their winter supplies of fuel and the requirements from other points have increased.

Steam coals have come into better demand from both the North and the South, especially with the Eastern Kentucky fields. There has also been some improvement in the Western field, though the winter requirements do not begin to help this section so soon.

Prices range around 75 and 80c. for the better grades of nut and slack; 90 to 95 for four-inch run of mine; $1 to $1.05 for run-of-mine; $1.65 to $1.75 for block, all prices f.o.b. mines.

MIDDLE WESTERN

INDIANAPOLIS

Operators expect an improvement by the middle of the month. The crop movement will then be under way and railroads will be larger buyers. Domestic grades will also be moving. Mines are on about half-time.

No improvement is noted yet but operators believe a change is due shortly. By the middle of August the movement of the wheat and oats crops will be felt and domestic grades will begin to move to retailers' yards for storage purposes.

Operators also expect an improved demand this month as a result of the low prices. These are still at the summer level and retailers will doubtless take advantage of them. The demand for steam grades is about unchanged. Mine-run is selling at $1.05 to 1.10 and screenings at 85 to 90c. The mines are on not better than half-time generally and low prices are made to keep them in operation. This is tempting some buyers who would not otherwise be in the market.

CHICAGO

Customary advances being made in the circulars. Considerable buying for storage purposes. Ohio coals still out of the local market.

Following the usual custom at this time of the year the companies are beginning to advance prices and quotations are now on the same level as those of last year.

Smokless and Hocking—There has been a marked improvement in the smokeless situation due principally to heavy storage buying for apartment houses. Retail dealers do not care to draw on their storage piles yet and are taking care of this demand by placing orders with the mines. The supply of smokeless lump and egg is still less than the demand and the price is firm. Although a few Hocking mines are now in operation, none of this coal is being received in Chicago the current production being moved to markets near the mines and to the Lakes.

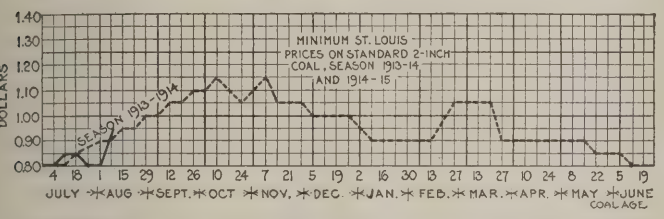
Illinois and Indiana—Carterville operators are asking $1.35 for lump and egg for the first half of the current month. No. 1 washed coal is being held at $1.40 to 1.50, the bulk of the business moving at the lower figure. Both groups of Franklin County operators have advanced prices. The smaller companies now have a circular price on lump, egg and No. 1 nut of $1.50 which will be in force until Aug. 15. Several of the larger companies have issued a circular of $1.60 for the first half of August and one concern quotes $1.65.

Prevailing prices in Chicago are:

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump	$2.07	$2.55@2.70	$2.12	
Steam lump	1.87@1.92		1.97	
Egg		2.55@2.70		$4.05
Mine run	1.87	2.15@2.25	1.87	3.30
Screenings	1.57@1.62	2.55@2.70	1.57@1.62	

Harrisburg quotations are: Domestic lump and egg, $2.40; steam lump, $2.25; mine-run, $2.15@2.25; screenings, $1.80@1.90; No. 1 nut, $2.55; No. 2 nut, $2.40.

Carterville prices are: Lump and egg, $2.40; No. 1 washed, $2.45@2.65; No. 2, washed, $2.35@2.40.



ST. LOUIS

Prices advancing and a stronger demand in all quarters especially for domestic grades. Steam coals the only exception. Possibilities of an acute situation already in sight this fall.

The month of July closed with prices advancing on all the high grade coals, especially domestic fuels, and a growing demand from all quarters. The steam market is a trifle weak

with prices gradually dropping; indications are that by the latter part of September prices on steam coal will be lower this year than they have in many years past, unless there is sharp picking up in the industrial lines. Prices on the high grade domestic coals advanced on the first of August from 10 to 20c. a ton, and these prices are only good for the first ten or fifteen days in the month, and subject to change without notice.

The washed market is a little weak, and washed coals have been lower than for many years at this particular time, although there are indications that the Nos. 1 and 2 washed sizes will move freely about the tenth of the month, when the cotton gins begin their buying in the South.

Standard 2-in. lump is gradually going up on account of the slump in the screenings market, and the first of the month saw this grade quoted at from 95c. to $1, with a good chance of going better. Screenings, on the other hand, were down to 60c., and liable to go to 50c. without more than 24 hr. notice. Even at this, the operators in the Standard field are still selling coal far below the cost of production, and it begins to look as if this would continue throughout the season.

The present circular is:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	.....	....	$1.30	$0.95@1.00	$1.00
3-in. lump	.....	....	.....	....	.....
6-in. lump	$1.25@ 1.40	....	1.40	1.00@1.10	1.25
Lump and egg	1.85@ 2.15	$2.15	.....	....	1.15
No. 1 nut	1.20@ 1.35	....	.....	....	.....
Screenings	0.70@ 0.75	....	0.80@0.85	0.65@0.70	1.60
Mine-run	1.00@ 1.15	....	.....	0.75@0.80	.....
No. 1 washed nut	1.35@ 1.40	2.25	1.50	....	.....
No. 2 washed nut	1.20@ 1.25	....	1.35	....	.....
No. 3 washed nut	1.15@ 1.20	....	.....	....	.....
No. 4 washed nut	1.10@ 1.15	....	.....	....	.....
No. 5 washed nut	0.60@ 0.70	....	.....	....	.....

Smokeless lump and egg is $4.90. The retail price is $6. Arkansas Spadra, f. o. b. cars St. Louis, for egg, grate, and nut is $5.80. The retail price $7.

KANSAS CITY

Operations on practically a fulltime basis and the outlook favorable. Stocks reported light.

Mines in Kansas and Missouri are working nearly to capacity. Demand is the best since last winter and operators are finding no difficulty in moving practically their entire output. Dealers' stock are light, as the result of their disinclination to buy, except on a hand-to-mouth basis, last spring. They cleaned out their yards in good shape at that time, and are now loading up for expected fall demand. With record breaking crops, operators believe that the season of 1914-15 will be one of the best in the history of the Southwestern trade.

PRODUCTION AND TRANSPORTATION STATISTICS

VIRGINIAN RAILWAY CO.

Shipments over this road for June, with details of leading operators were as follows in short tons:

Shipper	Tons
Knw., Glen Jean & E. R.R.	32,920
E. E. White[1]	26,073
Gulf Smokeless	21,869
Loup Creek Colliery	20,717
Slab Fork	19,811
New River Collieries	19,244
Pemberton Coal & Coke	17,253
E. E. White[2]	16,253
MacAlpin	14,324
Winding Gulf Colliery	13,278
Long Branch	12,454
Bailey Wood	11,707
The New River	9,743

[1]From Glen White. [2]From Stotesbury.

Gross shipments totaled 321,181 tons as compared with 304,030 for June, 1913, and 359,879 tons for May of the current year.

I. C. C. No. 5567—Beatrice (Nebraska) Commercial Club vs. Chicago, Burlington & Quincy R.R. Fourth section applications Nos. 1791, 1681, 1872, 1951, 2522, 4218, 4219 and 4784.

Rates on coal from Milwaukee, Wis.; Chicago and East St. Louis, Ill.; the coal fields of southern Illinois; southern Iowa; northern Missouri; the Kansas-Missouri districts and the Spadra, Ark., district, to Beatrice, Neb., not found to be unduly prejudicial as compared with lower rates to Lincoln, Neb., to which point Beatrice is intermediate. Complaint dismissed and carriers relieved from operation of the long-and-short-haul rule.

NORFOLK & WESTERN RY.

Destination of shipments over this road for June and the first six months of this year and last year were as follows in short tons:

	June		Six Months	
Coal	1913	1914	1913	1914
Tidewater, foreign	175,414	160,300	876,320	922,045
Tidewater, coastwise	.....	.....	22,841	15
Domestic	262,574	310,125	1,903,318	1,962,226
Coke				
Tidewater, foreign	1,623,923	1,845,531	8,651,814	9,632,950
Domestic	123,941	87,921	817,801	580,655
Total	2,185,852	2,403,877	12,272,094	13,096,989

Distribution of shipments for May and June compare as follows:

	May			June		
	Shipped	Tipple	Total	Shipped	Tipple	Total
Pocahontas	1,123,694	16,249	1,139,943	1,136,568	14,804	1,151,372
Tug River	260,887	2,268	263,155	242,208	2,134	244,342
Thacker	270,356	9,792	280,148	214,595	9,968	224,563
Kenova	92,958	8,810	101,768	88,455	8,897	97,352
Total	1,747,895	37,119	1,785,014	1,681,826	35,803	1,717,629

Shipments of coke, entirely from the Pocahontas field, amounted to 59,370 tons in June as compared with 60,949 tons in May.

FOREIGN MARKETS

GREAT BRITAIN

July 24—Spot coal continues to be weak. August coal, however, is very firm, in view of the Holidays and consequent further restriction of output. The Greek Government are reported to have bought a block of best coal, August shipment, at enhanced prices.

Approximate quotations:

Best Welsh steam	$5.04@5.28	Best Mountainshires	$4.08
Best seconds	4.56@4.80	Seconds	3.84@3.96
Seconds	4.20@4.32	Best Cardiff small	2.58
Best dry coals	4.20@4.32	Seconds	2.46

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those of Monmouthshire descriptions are net f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.

Coke is quoted at: Special foundry, $6.36@6.72; good foundry, $5.28@5.76; furnace, $4.56@4.80.

British Exports—The following is a comparative statement of British exports for June and the six months of the last three years, in long tons:

	June			6 Months		
	1912	1913	1914	1912	1913	1914
Anthracite	189,973	218,814	205,686	974,193	1,407,097	1,360,242
Steam	3,928,199	4,397,791	4,112,167	18,720,167	26,034,245	25,094,812

Island Creek Coal Co.

This company reports in part for the fiscal year ended Dec. 31, 1913, as follows:

Results—The mines during 1913 produced 1,916,000 tons, which is a decrease of 123,787 tons from 1912, the first decrease since mining operations began in your properties. The net profits also show a decrease of $47,460, due principally to the extraordinary causes below mentioned, which not only reduced the output but also to some extent disorganized our operating forces, involving a high expense.

In January 1913 a bridge on the Chesapeake & Ohio Ry., in process of erection across the Guyandotte River, near Huntington, W. Va., collapsed, and as all west-bound coal originating east of Huntington has to pass over this river, freight movements to the west on the Chesapeake & Ohio Ry. were very largely suspended for two or three weeks.

In April, owing to almost unprecedented floods, operations were again completely suspended on west-bound traffic for the best part of one month. The railroads affected by the floods were unable for several months thereafter to handle satisfactorily the same volume of traffic as previous to the floods. Your transportation properties on the Ohio River were not damaged to any extent by the floods nor was any of the floating equipment lost. Railroad transportation conditions, moreover, were poorer than usual.

During the entire year there was an ample market for coal, and your company could have disposed of a larger tonnage than it did if railroad transportation facilities had permitted. The new dock at Duluth was placed on an operating basis and handled a fair tonnage of coal in a very satisfactory manner. In June the saw-mill at Holden was destroyed by fire, and there were, therefore, no earnings from that source during the last six months. The sawmill, having been rebuilt, was put in operation in Jan. 1914.

The increase of $13,139 in the administrative and general expenses is the result of additional burdens imposed by the new income tax Act.

The charge against earnings for depreciation has been increased over that of last year, notwithstanding that a smaller tonnage was produced, and it is the belief that depreciation charges are upon a liberal basis.

Dividends—Preferred dividends at rate of $6 per share per year and ordinary dividends on common stock at rate of $2 per share per year, as well as an extra dividend on the common stock of $3 per share, were paid during 1913. The extra dividend was intended as a distribution of part of the surplus which had been accumulated in earlier years. The total of the surplus , Dec. 31, 1913, was $848,796, a reduction of $200,025 from last year.

COAL SECURITIES

The following table gives the range of various active coal securities during the week ending July 30, the New York Exchange being suspended Friday and Saturday July 31 and Aug. 1:

Dominion Coal Co., Ltd.—Dividend of 3½% on preferred, payable Aug. 1 to holders of record July 17.

COAL AGE

Vol. 6 NEW YORK, AUGUST 15, 1914 No. 7

The history of humanity is largely a history of its leaders. In connection with absolute monarchies such a remark is not surprising, but the statement holds with equal force in a consideration of any type of democracy.

Professors of political economy may tell us that such a belief is not in accord with the spirit of democracy, but they cannot disprove the truth of the assertion.

Not only is this statement true with reference to politics, but it holds with equal force in trades and professions. Let us hasten to add that we are not launching on a discussion in political economy.

We only wish to point out that miners are not the only class of human beings who follow after leaders. Even the most casual reading of history will also convince any one that leaders in the past have been of every sort, good, bad and indifferent. Why wonder then that miner folk are often led in search of false gods.

Let's go a little farther; since the leaders themselves are only human beings, is it strange that even they are sometimes misled by visions, or if not misled, are frustrated by other leaders who are following visions?

Such facts emphasize the folly of ignoring leaders. If they have had dust thrown in their eyes, help them to remove it. If they are attempting to throw dust in other people's eyes, make *them* (the leaders) realize that it can't be done. The most formidable ones are often victims of nightmare.

Most steps forward in industrial relations can be traced back to leaders who have progressed beyond their fellows and then have reached out to pull the lagging ones ahead.

Compare this method of progress with the only other system possible, namely, educating an entire community so that an educated leader must be chosen and the possibilities are apparent at once.

And even granting that the whole scheme is undemocratic (which it most certainly is), what harm can come of accepting the inevitable and trying to make the best of it?

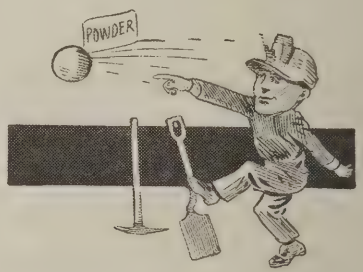
If you think your are above hero worship yourself just think back a few years and try to explain some of your actions during one or two political campaigns. Better look at yourself in a mirror while you are doing it.

The Coal Miner

(After Kipling's, "The Sapper")

By Berton Braley

Written expressly for Coal Age



He may be a Russian, a Czech or a Pole,
He's princip'ly human, but partially mole,
And down in the workings he digs up the coal
And works for the wage of a miner.

He's seldom an angel—and sometimes a scamp,
He's often a bit of a rover and tramp,
But down in the darkness, the dust and the damp
He follows the trade of a miner.

Now if you would join with this coal-mining clan,
You hark to your elders as close as you can,
And listen to me while I tell you the plan
To pattern your life as a miner.

Be modest and quietlike when you begin,
Don't try to hand out any manner of chin,
It's a wise guy who doesn't get fresh and butt in,
When he's a new hand as a miner.

Don't think when you're careless that's showing your skill,
Don't take any risks that are not on the bill,
Don't smoke where it's gassy or tamp with a drill,
It proves you a fool of a miner!

When working with powder be gentle, that's all,
Don't slam it around like a cheap rubber ball,
For it sometimes makes pieces exceedingly small
Of someone who once was a miner!

Keep out of the places that sell you the drink,
They'll give you—a souse, and they'll take all your chink,
And they're likely to land you kerplunk in the clink
Which is not a bit nice for a miner.

Just take your pay home to your children and wife
Don't get into rows and dissensions and strife,
And you'll probably rise to a station in life,
As foreman of hundreds of miners!

It's true I ain't done things exactly that way,
And that's why I'm toiling and sweating today,
Don't do as I DO—but just do as I SAY,
Which is first class advice for a miner!

Modern Preparation of Bituminous Coal at the Mine

By R. G. Read*

SYNOPSIS—Broadly speaking, there are two classes of preparation plants—those handling steam coal and those treating domestic fuel. Representative examples of each type are here described.

The last 10 years have witnessed a marked improvement in the preparation of coal at the mines. This condition has been brought about by three main causes:

1. Increased use of mechanical stoking and combustion appliances, which has necessitated more careful sizing to suit individual requirements.

2. Scientific purchasing with respect to the sulphur and ash content of the coal which has forced a thorough cleaning.

3. Increased cost of labor at the mines, which has made advantageous the use of machinery wherever possible.

Coal preparation may be roughly divided into two classes corresponding to the existing market requirements:

1. Preparation for steam purposes, under which may be included the coal for the lake trade, which is only partially prepared at the mine.

2. Preparation for domestic or special uses.

In the general consideration of the subject, it may be well to call particular attention to the advisability of making a careful investigation into the physical characteristics of the particular coal in question before deciding to what extent preparation should be attempted. The coal from the different fields of the country, and, in fact, from different parts of the same region, varies to such an extent that no hard-and-fast rules may be laid down.

The prudent owner will, however, before embarking on the construction of an elaborate and expensive plant for the preparation of his coal, determine whether or not its physical nature is such that it will stand the treatment which may be necessary. The coal may be so soft or friable and the breakage and resultant percentage of fine material be so great as to make the preparation of no commercial value. The writer has seen a number of cases of this kind where large sums have been expended, resulting only in disappointment. There are some coals which are affected by the atmosphere to such an extent that careful screening and sizing at the mine is not apparent when the fuel reaches its destination. These remarks are intended to refer only to the sizing and not to the cleaning processes, as cleaning any kind of coal increases its commercial value.

In order that this article may be of greater interest it has been deemed advisable to describe two representative plants covering the general divisions referred to above. It is not to be understood that these examples cover all points involved, but they have been chosen as being typical and because no washery is operated in connection with either one.

Fig. 1. A Typical Plant for the Preparation of Steam Coal

The subject of coal washing is so intricate and of such a technical nature as to be best taken care of in a future article. It is now generally conceded that washing as a means of cleaning coal should only be applied to the small sizes, and even here its advisability should be considered with extreme care before this method is adopted.

A description of the two representative plants follows:

The Steam Coal Plant

The main points to be considered in the design of an equipment of this nature are simplicity in the handling of the coal and economy in power and labor. The preparation consists largely of screening the fine coal out of the run-of-mine. The present practice is to use gravity or stationary screens for this purpose.

Fig. 1 shows a general view of a double tipple of the

*Webster Bldg., Chicago, Ill.

latest design for this purpose. This consists of two entirely separate handling equipments, the right-hand side being arranged for screening purposes and the left for loading straight run-of-mine coal. No picking or cleaning other than an inspection in the railroad cars and the removal of large pieces of slate or refuse is provided for in this installation.

The operation is as follows: The coal is dumped from the mine cars into a receiving hopper of about 10 tons capacity, from which it is delivered by means of a reciprocating plate feeder to the top run of an inclined apron conveyor which elevates and discharges it into a small chute, from which it flows by gravity to the screens. The large coal passes over the screen and is loaded into the railroad cars by means of a curved-end loading chute with an adjustable apron.

This apron may be provided with fingers resembling a fork, which tends to deposit the small lumps underneath and the larger on top, which gives the loaded car a better commercial appearance. It was formerly the custom to design loading chutes to discharge crosswise or at right angles to the car. This necessitated the employment of at least two men, who were known as "trimmers," whose duty it was to build the pile on the car, this process being known as "topping out."

This was, of course, costly and dangerous, as the large lumps frequenty came down with such velocity as to injure the men. In no other detail has there been such improvement as in the design of these loading chutes. This will be more clearly understood from the fact that one person with small effort now loads the coal in quantities and in better condition than it could formerly have been done by four men.

Reverting to the consideration of the plant in question, the small coal drops through the upper screen onto the lower, where it is divided into two sizes, the larger being loaded as nut or egg on the center track. The upper screen is provided with suitable mechanism for quickly changing the spacing of the bars so as to vary the minimum size of the lump or maximum size of the small coal. The usual spacings are ¾ in., 1¼ in., 1½ in. and 3 in. The 1¼-in. spacing is the one most commonly used. In some installations this screen is made in sections about 4 ft. long, with a vertical drop of 4 in. to turn the coal over.

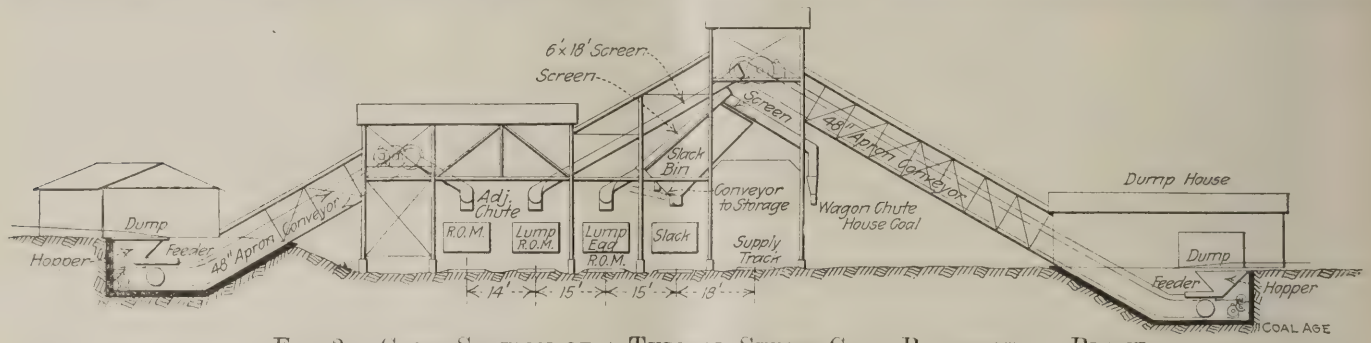


FIG. 2. CROSS-SECTION OF A TYPICAL STEAM COAL PREPARATION PLANT

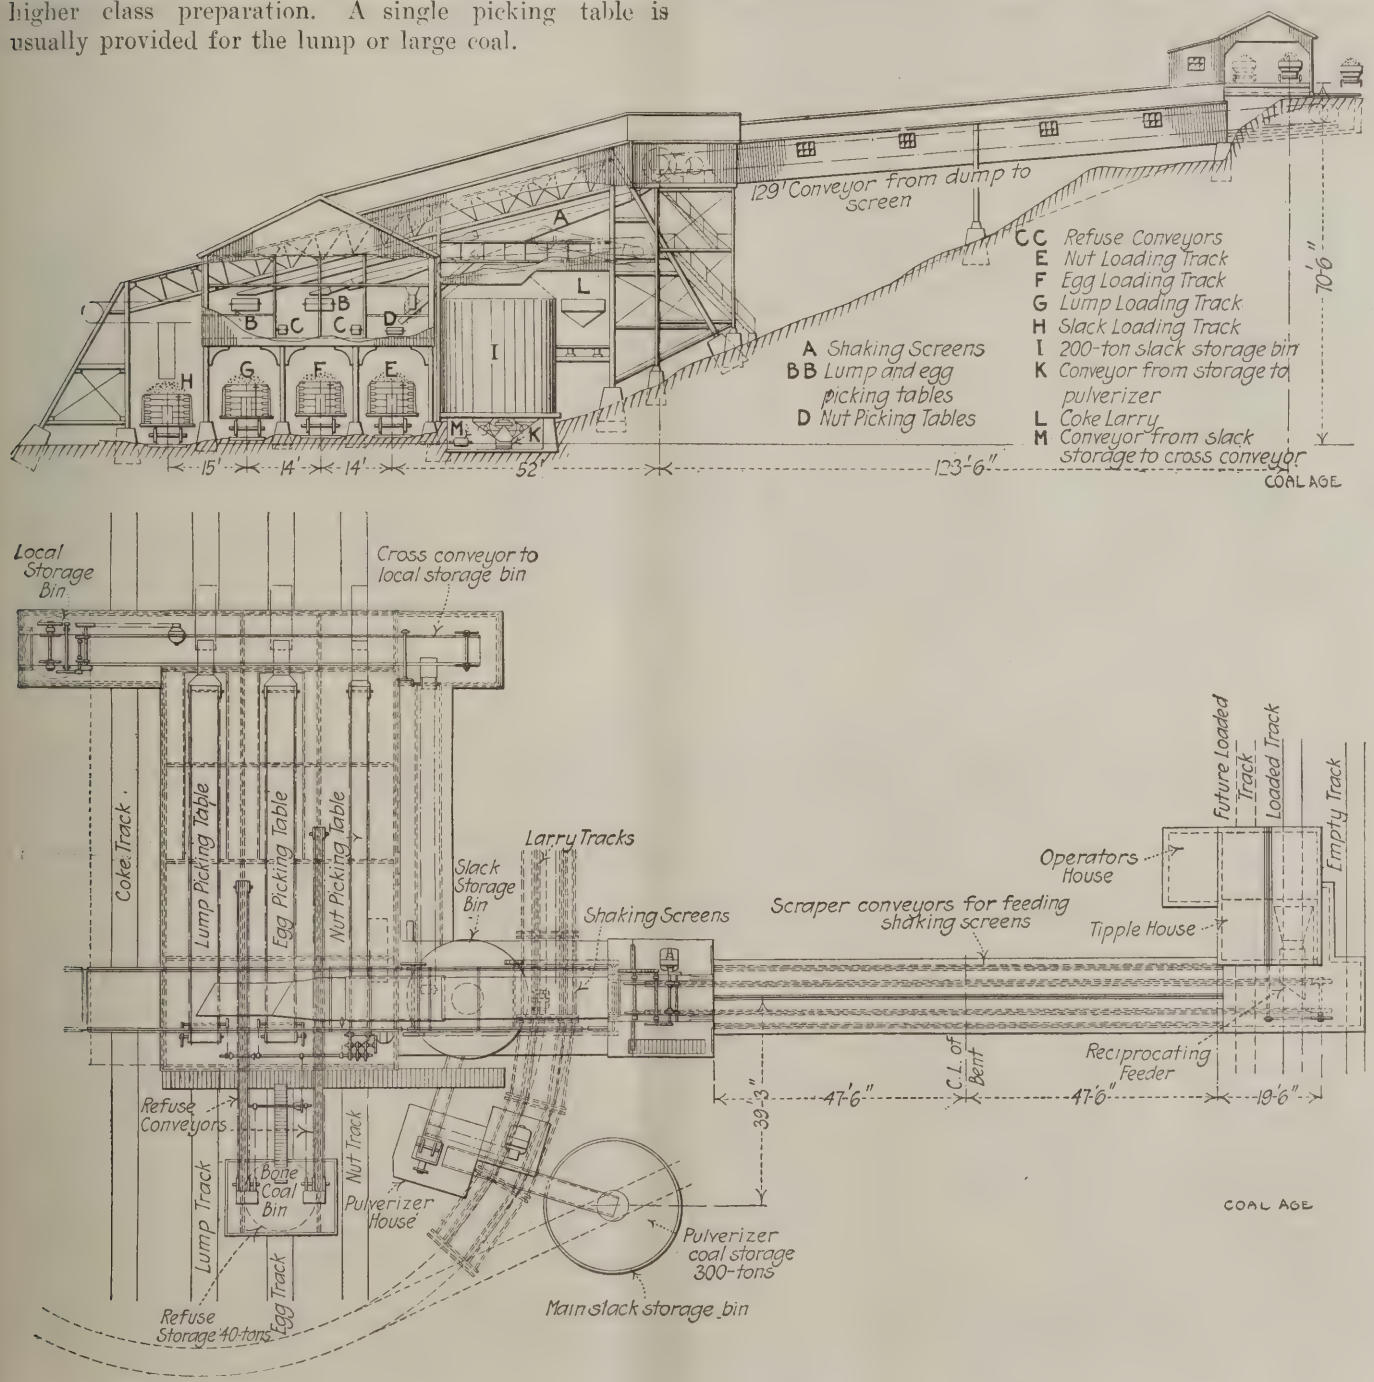
SLACK IS EITHER SOLD OR MADE INTO COKE

The slack or fine coal from the under screen falls into a collecting bin or hopper, from which it is discharged into the railroad car or to a conveyor which carries it to a larger bin, from which it is taken to ovens for making coke. Provision is usually made in installations of this kind for conveying slack in sufficient quantity to the boiler house for power purposes, also for loading partially screened coal into wagons for delivery to the miners' houses for domestic fuel.

The handling equipment on the left is of the same general character except that no screening is provided for, the coal being loaded as it comes from the mine. This coal is largely used by the railroads for fuel, and by the larger distributing companies who maintain screening plants for retail purposes, in which case it is screened at the distributing center. The increasing use of stoker-fired locomotives is beginning to be felt in the trade, and it is probable that future installations will have to provide for at least enough screenings to meet these changing conditions.

It will be understood that the method of delivering



FIGS. 3 AND 4. TYPICAL PLANT FOR THE CAREFUL PREPARATION OF DOMESTIC FUEL

the coal from the mine to the screens varies with the local topographic conditions and the relative elevation of the coal seam and the railroad tracks. It is, however, becoming the general practice to dump the coal into a hopper at or near the mouth of the mine, from which it is conveyed to the screens. It was formerly customary to transport the mine cars to the screens, but this requires an expensive structure and complicates the operation of the equipment. The old method by which the coal was dumped in bulk into the screening equipment has been superseded by some method of feeding the coal at a uniform rate so that a better separation may be secured.

In the cases where cleaning of the coal is required it is taken care of in the manner described later. The picking or cleaning of fuel of this kind is not carried on so extensively or to a point of such refinement as in higher class preparation. A single picking table is usually provided for the lump or large coal.

The fundamental considerations in a plant for domestic preparation are to provide thorough screening or sizing, efficient cleaning and an adequate mixing of the various grades after preparation. The mixing is necessary so that any combination of sizes may be made to meet special combustion requirements. It also frequently happens that there is a large demand at high price for one particular size, while that for the other sizes is light, in which case the separation of all grades is made and the particular size desired is loaded separately, the others being mixed and loaded together. It will be understood that in order to properly clean the coal it is necessary to isolate it and pick the different sizes separately.

The plant taken as an example perhaps represents the highest development in this country, although there are installations of more recent completion. These later

FIGS. 5 AND 6. PLAN AND CROSS-SECTION OF PLANT, SHOWN IN FIGS. 3 AND 4

plants have, however, developed no new ideas and, in fact, have not carried the various operations to so high a point of refinement as the one to be described. It may be frankly stated that in the writer's opinion, the various operations are carried beyond the practical requirements of the trade at the present time, but the unavoidable expenditure was so great that the owners desired to anticipate future needs, since the life of the plant must necessarily be prolonged in order to justify the initial investment.

The question of handling the material so as to cause a minimum of breakage was given special attention, as the coal handled is rather soft and friable. Figs. 3 and 4 are general views of the equipment. The coal is dumped and conveyed to the screens substantially as described under the preceding section of this article. Figs. 7, 8 and 9 show a car dumping, the feeder and the conveyor.

The screens are what are known as "shakers" and consist of steel plates with different sized perforations built in a frame which is suspended either on hanger rods or rollers. This frame is connected to eccentrics which impart a reciprocating or shaking motion. It will be noted that these screens are on a much flatter pitch than the gravity type described above, the relation being approximately 15° to 30°. Fig. 10 shows the general construction and operation of screens of this class, but those

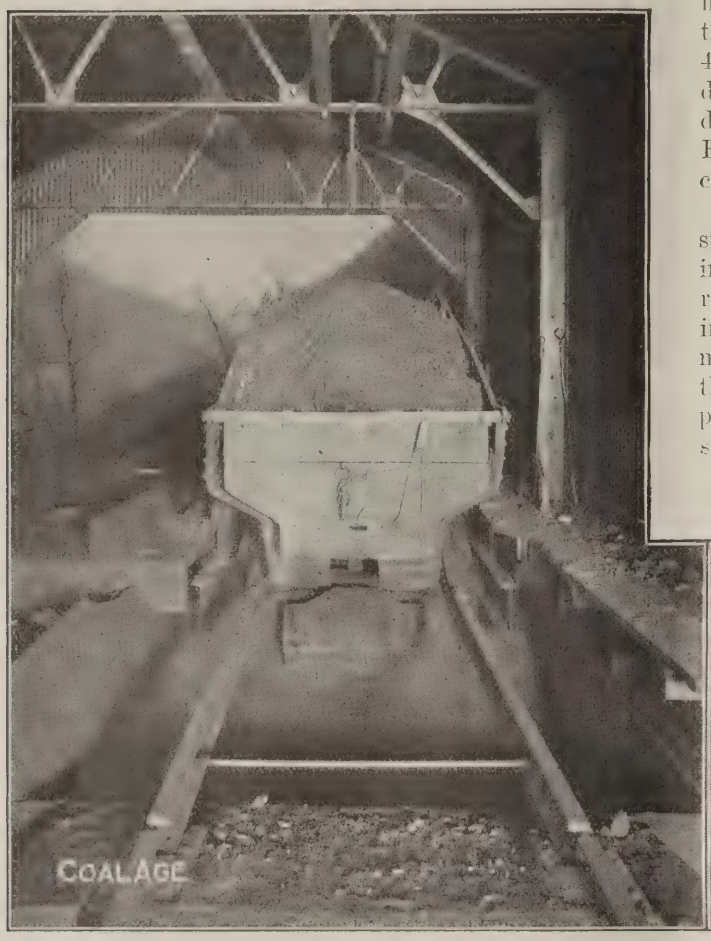


FIG. 7. A CAR ON THE HEAVY CROSSOVER DUMP

FIG. 8. RECIPROCATING FEEDER DISCHARGING TO CONVEYOR

FIG. 9. GENERAL VIEW OF CONVEYOR

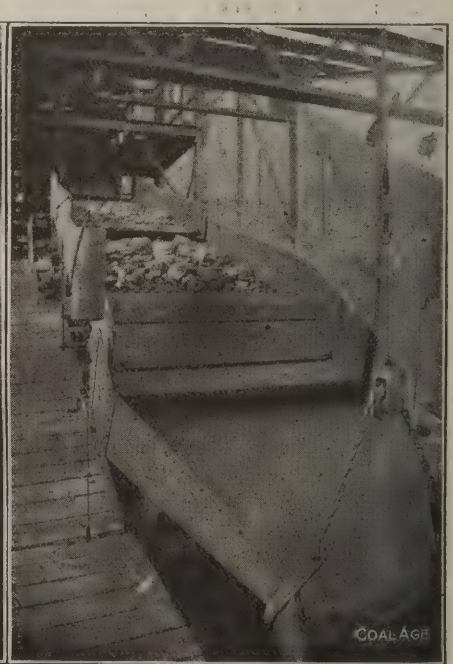

FIG. 10. THE SCREEN DISCHARGE

Fig. 11. Lower End of Shaking Screen over Picking Table

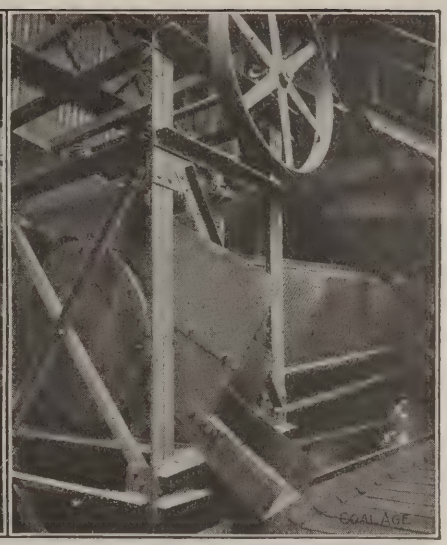

Fig. 12. Revolving Nut Screen

here illustrated are not a part of the equipment under discussion.

Picking Tables Have Adjustable Loading Booms

The lump coal after passing over the screens is discharged onto a picking table, which in turn delivers it into the railroad cars. Fig. 11 shows the end of the screen discharging onto the picking table, which consists of a flat steel belt made up of overlapping plates mounted on roller chains at either side which travel at the rate of about 40 ft. per min. Fig. 13 shows the pickers removing the refuse, consisting of slate or bone, and depositing it in chutes leading to refuse conveyors under the floor, which deliver it to a storage bin over the railroad track. This refuse is loaded in railroad cars and used for filling purposes along the tracks.

The discharge end of the picking table is supported on a structural hinged frame or boom, which is attached to an electric hoist, thus providing a means of raising and lowering the discharge of the coal to suit the cars. A small adjustable chute with loading "fingers" is fitted to the end of the boom.

The introduction of the loading boom has had a wonderful effect in the reduction of breakage, as coal can be laid down in the bottom of the car with practically no drop or fall.

The egg coal is handled in the same manner as the lump and goes through a similar path to the cars. The nut coal, on the other hand, after being separated on the shakers, is rescreened in a revolving or rotary screen, as shown in Fig. 12, to remove any slack or fine coal which may have passed over with it, and is then delivered to a picking table, where it is treated in the same manner as the lump and egg, except that no loading boom is provided, the delivery to the cars being made by a fixed chute with an adjustable apron.

The slack from the shaker screens passes into a storage bin, from which it is conveyed to a pulverizer and pre-

Fig. 13. Loading Booms at End of Picking Tables and Pickers Removing Slate

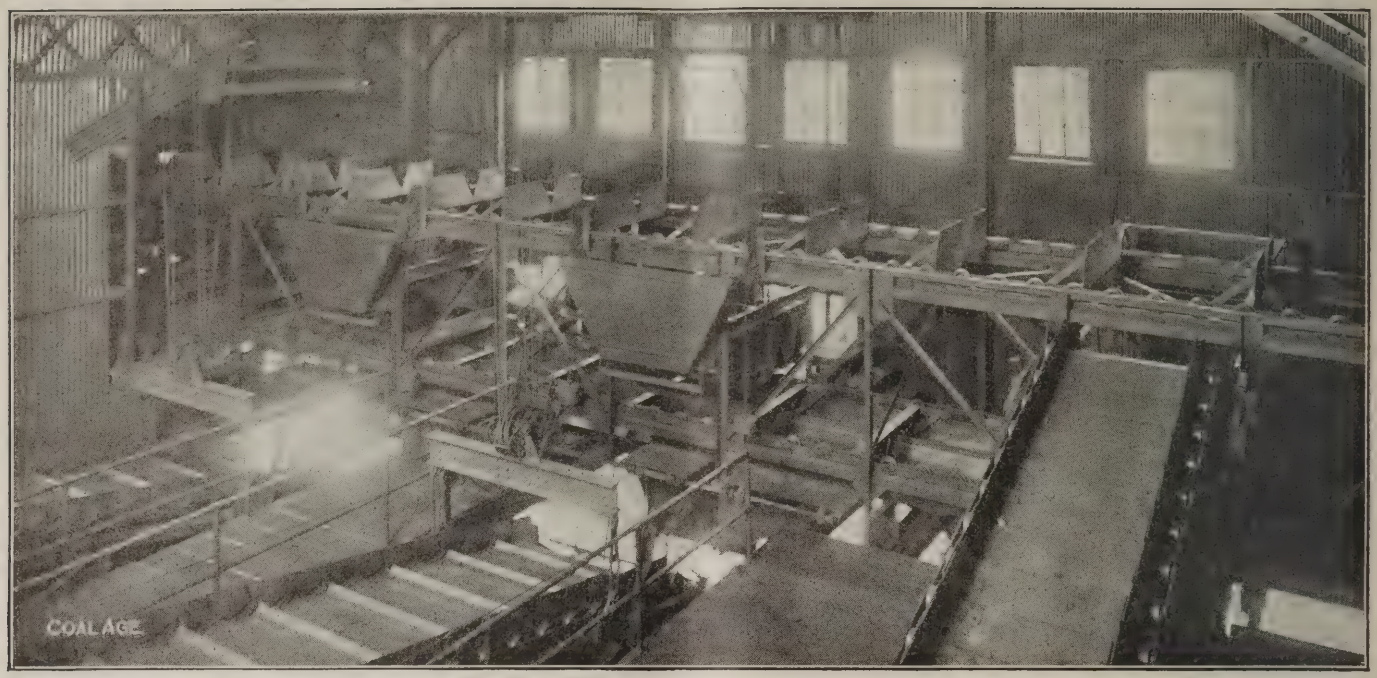

FIG. 14. THE TRANSVERSE MIXING CONVEYOR OVER THE END OF THE LOADING BOOMS

pared for making coke. An elevator carries it to a second storage bin, from which it is taken to the ovens. Provision is also made for conveying the slack to a point where it may be mixed with the other sizes or loaded in cars on a separate track.

The mixing of the different sizes after preparation is accomplished by means of a cross conveyor shown in Fig. 14, located at the end of the loading booms and the nut and slack conveyors. The booms are raised by means of the electric hoists above mentioned, and the slack and nut conveyors are arranged to discharge into this mixing conveyor, so that any combination of sizes can be made as desired. Provision is also made for discharging coal from this conveyor into a storage bin for wagon coal to the miners' houses.

The capacity of this plant is 5000 tons per day of 10 hours, with a maximum capacity of 750 tons per hour.

Fig. 15 illustrates a typical sizing equipment in connection with a retarding conveyor for delivering the coal to the screens, while Fig. 16 shows a similar installation in connection with a shaft mine.

In the Illinois field it is the general practice not to separate the nut and slack on the shaker screens, but to deliver the mixture to a rescreening plant, where it is separated into several intermediate sizes, which are stored in separate bins from which they may be loaded into the cars.

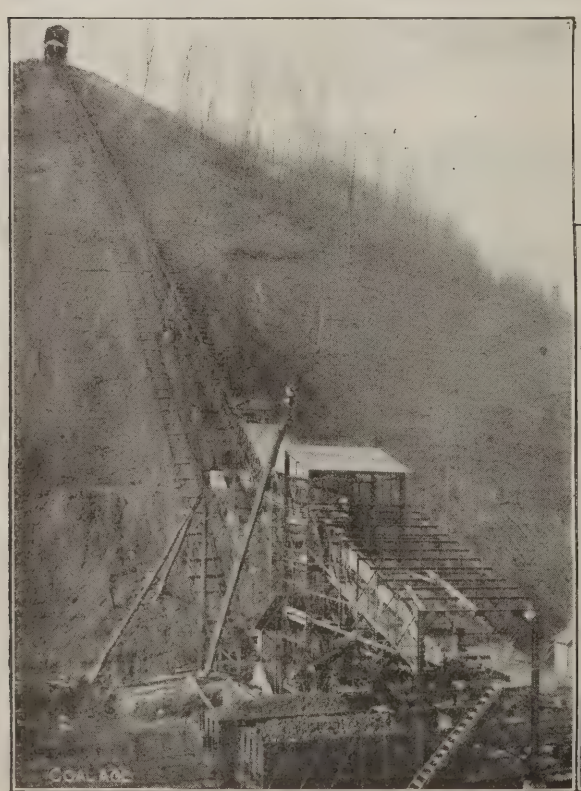

FIG. 15. A SMALL SCREENING PLANT AND A RETARDING CONVEYOR

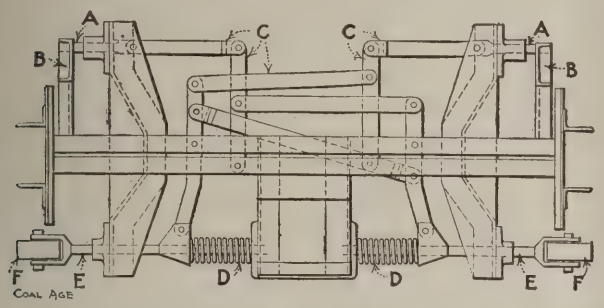

FIG. 16. A PREPARATION PLANT AT A SHAFT MINE

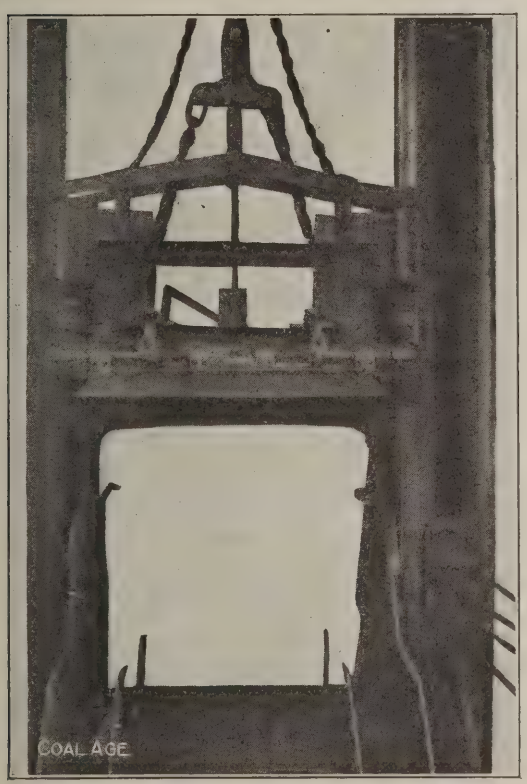


The Phelan Patent Safety Device

The Phelan patent safety device for self-dumping mine cages is essentially an automatic catch for preventing the cage from tipping in the shaft, or before it reaches its proper discharging position. It is so designed that the cage cannot tilt until the tip wheel enters the dumping guides at the proper point of the head frame.

Two forged steel pins *A* arranged to permit lateral motion engage at one end with each of the tip frame channels *B* and at the other end with a series of

TOP VIEW OF SAFETY DEVICE

GENERAL VIEW OF SAFETY DEVICE APPLIED TO CAGE

levers *C* which are actuated by two amply large springs *D* mounted on steel shafts *E*. The spring shafts *E* have forged eyes which are designed to accommodate the 6-in. diameter rollers *F*. These rollers are held in the out position by the springs *D* which also retain the latches *A* in engagement with the tip frame channels *B*.

Upon entering or at the point of entering the tip guides, each of the rollers *F* comes in contact with a wooden track which is so shaped as to depress the rollers, compress the springs *D* and release the tip frame latch *A*, allowing the cage to dump. On the return trip the rollers are released by the track and the catches *A* are immediately forced into safety position by the springs *D*.

Aside from being an absolute preventive of accidents which frequently occur from the cage turning over in the shaft, this device should recommend itself to all users of self-dumping cages on account of the saving of wear on the guides. The catch relieves the tendency of the cage to overbalance and by holding the tip frame guide-plates away from the wooden guide-rails and throwing all the engagement onto the guide angles of the cage it proves a decided factor in preventing wear on the wooden guides in the shaftway.

The manufacture and sale of this device are controlled by the Scottdale Machine & Manufacturing Co., Scottdale, Penn.

Rules for Boiler Erection

The Inland Steel Co., in its Book of Rules, gives the following instructions for boiler erection, which apply rather to the operating forces than to the erecting gang:

(1) Boilers shall be numbered at both ends and on top. The numbers should be placed so as to designate the boilers to which they apply and should be large enough to be plainly seen. Numbers perforated in steel plates are recommended.

(2) Seamless tubing should be used in all boilers.

(3) Guards should be provided for water-gage glasses.

(4) Pop safety valves of ample capacity should be provided and piped through the roof or to the outside of the building. No stop valve should be placed between the safety valve and the boiler.

(5) To relieve pressure in the blowoff line, for each battery of eight boilers, or fraction thereof, a vertical pipe should be connected with the blowoff line and run up through the roof, or to the outside of the building.

(6) Two stop valves should be provided in the blow-off connection.

(7) Two valves should be placed in feed-water connections of each boiler, one on each side of the check valve.

(8) To avoid untrue indication of water level, and possibly an explosion, no valves should be placed in connections between water columns and boilers, or if valves are so placed they should be locked open when not in use.

(9) One of the two valves in the connection between the boiler and the steam header should be a nonreturn valve.

(10) Suitable drains should be provided where necessary on all steam lines.

(11) Walks or platforms, equipped with suitable stairs or ladders, should be provided, wherever possible, on boilers, steam header and other places where men have to work.

(12) When boilers are not equipped with nonreturn valves, a guard provided with a lock, designed to lock the steam-valve wheel, should be provided and used when men are working in the boilers, to prevent anyone from turning in steam.

(13) Plank covering over exhaust pits should be frequently inspected and kept in perfect repair.

Extracts from a Superintendent's Diary

Attempting to honestly enforce the laws which regulate the ages at which children shall be employed within the mines has kept me sitting on thorns for the past month. For a time we were not vigilant about this matter, but lately word has come out from our legal department that we are to assume no discretion in interpreting the law and the rulings from our legal department cannot be winked at.

Each father has a special reason for wishing to work his boy, but they all come under two classes: 1. The boy does not want an education and so would be better off at work. 2. The boy's wages are absolutely necessary to the family. When argument fails, other means are attempted, such as concealing the boy's age.

If I were entirely in sympathy with the law, the task would not be so difficult and I might even derive some pleasure in trying to outwit the law-breakers, but I haven't been able to convince myself that 16 years is in all cases a desirable age limit.

I realize that we mine superintendents are not considered good judges when it comes to deciding questions of sociology, so I have taken pains to read all of the arguments advanced by the defenders of the law and still it looks visionary to me.

They insist that until a child is 16 he is not competent to choose a congenial occupation and for that reason he ought not to be forced into work which cannot benefit him, but on the contrary tends to dull his intellect for all future time.

Today old man Powell came to ask my advice about what to do with his son. He is 18 now and has never done a stroke of work worthy of the name. The father, a miner of the old school, accumulated a fair competency at hard work, while the boy was still a youngster, and, like many miners similarly situated, decided to give his son an education and put him in one of the professions. He realizes now that the boy cannot or at least will not take an education, and likewise he will not go to work. Keeping at work is either a matter of habit or the outcome of a determination to accomplish something in the world. This boy has never been allowed to acquire the habit and his teachers haven't been able to give him a life vision.

If he ever develops into a sure enough man, it will be in spite of his father's planning rather than because of it.

And he's not very different from six or seven other young fellows of our town with whom he passes most of his time.

In contrast to them I see our boss driver's son, who has worked in the mine every day since he was 13. He's now 18. Next year he expects to complete the correspondence course he is taking, after which he has been promised a position in a machine shop that specializes on mine equipment. Suppose he fails to make good, he still has the working habit to fall back on.

If the boys who have come under my observation are fairly average, I should say that the ones who have passed 16 without having earned a dollar will have to depend upon their wits mostly if they succeed in the world, and if all of them are successful at that, surely the value of labor to the world has been greatly exaggerated.

Southern Appalachian Coal Operators' Association

The semi-annual meeting of the members of the Southern Appalachian Coal Operators' Association was held in Knoxville, Tenn., Friday, July 24, about 100 being present. Gov. B. W. Hooper was present to confer with the operators in reference to the demand which they have made for years that the 800 state convicts, now employed at the state mine, be removed and placed on the public highways. Tennessee employs a large number of convicts on a farm; several hundred are leased, at a low rate of course, to lessees using them in different lines of trade, but no more than 199 are ever employed in any one trade except coal mining. It will thus be seen that coal operators are subjected to discrimination.

The convict mine is one of the largest producers in the state, is therefore a factor in the market, and, worst of all, state coal is sold regardless of market prices, especially when the market is at its worst, thus making the demoralization of prices more complete. Operators have persistently endeavored to get the convicts out of the mines, but politics has prevented. At this meeting, however, Governor Hooper assured the operators that he was in favor of placing a large number of convicts on the farm and some at trades, but with the number to each trade limited, so that their labor would have but little effect upon similar trades. Other convicts, he thought, should be placed on the public highways.

However, he stated that the operators should endeavor to convince the public and members of the legislature, which meets next December, that the coal industry is being injured by the employment of convicts in the state mine; also that some plan must be made to dispose of the operation without a large loss to the state on its investment, which amounts to several hundred thousand dollars. The state owns a good property, fairly well equipped, and it is believed that the mine could be leased if not sold outright.

E. C. Mahan reported briefly regarding the progress of the general freight rate case before the Interstate Commerce Commission, in which are involved all coal freight rates between Virginia, West Virginia, Kentucky and Tennessee and all southeastern territory. All evidence is before the commission, the case is to be argued at a date to be set, and a decision will probably be given in the latter part of September or early in October.

Under the leadership of B. A. Morton for the first three years and of E. C. Mahan, who now serves his second term, the Southern Appalachian Coal Operators Association has succeeded in getting a large majority of the coal operators of the Tennessee-Kentucky field to work together for the common good. This has been especially true in handling freight-rate cases and in the securing of credits and collections, many operators saying that the latter department has saved them many times the cost of membership and dues. Members' meetings are held quarterly, while domestic operators have frequent informal conferences during the season. The headquarters of the association are in the Holston National Bank building, in charge of the secretary-treasurer, J. E. McCoy. His offices adjoin those of the president, E. C. Mahan, who is general manager of the sales department of the Southern Coal & Coke Co.

Care of Rubber Belts

SYNOPSIS—Notes on splicing big and small belts so as to promote long life and smooth running. Square and diamond lap joints and those with a back splice are described. The writer points out the severe strain to which a thick belt is exposed on a small pulley.

Some valuable kinks in the handling and splicing of rubber belts are given by Robert Moore in *Power*. Care must be taken in putting on a new belt to stretch it as much as possible before splicing.

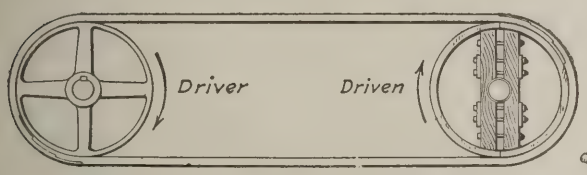
In placing a 36-in. eight-ply rubber belt on pulleys 50 ft. between centers, allow 1/8 in. per running foot for stretch. Put on the clamps, as shown in Fig. 2, and draw them tight. Do not be afraid of breaking the belt, as even a five-ply 10-in. belt will stand a strain of 10,000 lb. and larger ones in proportion; the pulley will collapse first. Take all the tension the bearings will stand, then turn the shaft slowly back and forth until the clamps touch the pulleys; taking up the slack as it is recovered from the upper half. Neglect to do this will stretch only one-half of the belt, and is apt to cause it to run out of line.

Preparing the Lap

After thoroughly stretching, proceed with the lap, which in this case should be 45 in. long. It should always point in the direction of travel over the pulley, as in Fig. 1. Thus any slip of the pulley will have a tendency to smooth down the lap. Place a board on the clamp rods on which to rest the splice and draw a line squarely across the belt 47 in. from the end. Lay the section off in 2-in. squares, starting 1 in. from the outer edge, as in Fig. 2. Punch 1/4-in. holes where the lines cross. As there are eight plies, there will be three cuts or scarfs. Cut a line just the depth of two plies at the 45-in. line and peel off these two thicknesses; do the same at the 15- and 30-in. lines.

Cementing and Sewing the Lap

Scarf the other end, place the halves together and punch holes in the lower half, inserting the punch in the holes in the upper half. By so doing, the holes will be directly opposite each other. Cleanse the surfaces with naphtha and apply a liberal coating of the best rubber cement. Allow this to dry until it will not stick to the fingers, then place the laps together, starting at the edge and rolling the upper one out as it is being cemented, so that air may not be entrapped between the surfaces. Sew the outer edges, using the shoemaker's stitch, shown in Fig. 3. Alternately roll and pound the joint until it is perfectly flat, then sew each row of holes as was done with the outer ones.



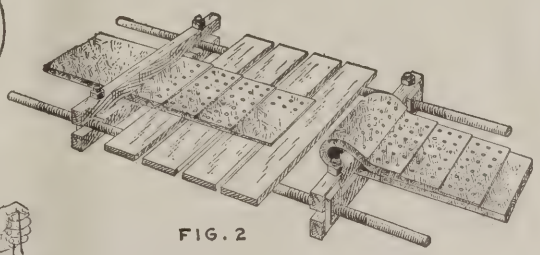


FIG. 1

FIG. 2

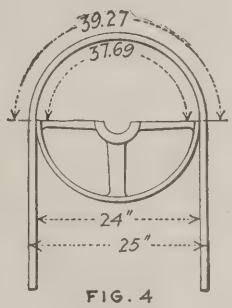

FIG. 4

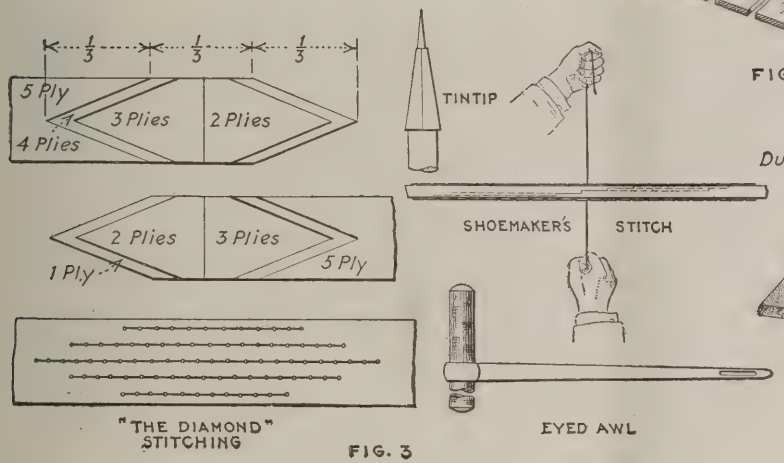

FIG. 3

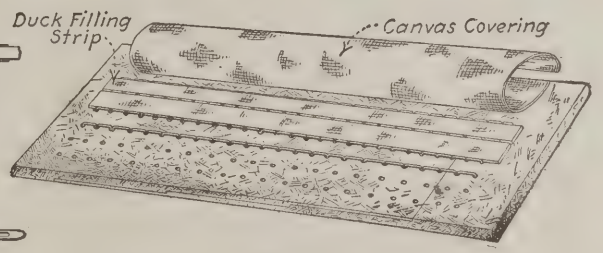

FIG. 5

METHODS OF STITCHING BELTS

Cut filling strips of duck the width of the spacing between lacings (most belt companies sell this duck all prepared) and give them several coats of rubber cement on each side. Clean the face of the belt between the laces with naphtha and give it a liberal coating of cement. When each surface is dry, that is, when the finger placed lightly to the surface will not adhere, place the strips between the lacing and roll them down. Now take a piece of duck, the width of the splice, but 4 in. longer, and cement this to the face of the belt, covering the joint. By so doing the lacings are protected and, except for the occasional renewal of the outer covering the joint is as durable as the belt itself. The manner of this is shown in Fig. 5.

For sewing, tip the laces like a shoe string by bending a V-shaped piece of tin around the ends, as illustrated, or use the eyed awl shown, to pull the lace through.

Small Belts Are Butted

Belts smaller than 10 in. are butted and have a butt strap on the outer surface; this is known as the "back splice." Belts on grindstones, saws, rattlers, etc., where shippers are used will wear on the corners where they are butted, and the outer lace hole will soon tear away, if this form of joint is not used. Shippers for belts of this kind should always be of the roller type. In joining canvas belts always stagger the holes and do not have them less than 1¼ in. apart as the fabric is apt to crack across in cold weather.

The Diamond Splice

Another form of joint, known as the "diamond splice," is used on generators with small pulleys, as there is less shock when the lap passes over the pulley, eliminating all flicker of the lamps when generating power for a light circuit. The diamond splice is made in much the same manner as the lap splice except that the scarfs are divided into three equal parts and cut as shown in Fig. 3; it is not so strong a joint as the lap splice, but is more flexible and, therefore, better adapted to small pulleys.

Why Small Pulleys Are Undesirable

Increasing the diameter of the pulley lengthens the life of a belt, as the stretch and compression are less per foot. As the thickness of the belt increases, so should the diameter of the pulley increase. For instance, the arc of a belt ¼ in. thick on a 2-ft. pulley would measure 37.69 in. next the pulley face, while the outer edge would measure 38.48 in., a total distortion of 0.79 in. If the belt were ½ in. thick the outer edge would measure 39.27 in., giving a total distortion of 1.58, just twice as much (Fig. 4). When more power is wanted and it is not advisable to increase the size of the pulley, better results are obtained by widening the belt and pulley face than by increasing the thickness of the belt. To increase the diameter of the pulley to 48 in. would give a total distortion of 1.58 in. when using a ½-in. belt, but as the arc would measure 75.4 in., the distortion for each lineal foot would be halved.

Animal fats and grease should never be used on rubber belts. Boiled linseed oil is good; also equal parts of black lead, red lead, French yellow, litharge and enough japan dryer to make it dry quickly. This will give a smooth, polished surface.

The Gary, W. Va., Gardens

The U. S. Coal & Coke Co., of Gary, W. Va., made their annual awards of premiums for the best kept yards and gardens at their various plants, on July 21 and 22. A committee of four, was selected for making the awards, consisting of Dr. E. A. Schubert, traveling agent, Agricultural & Industrial Department, Norfolk and Western R.R. Co.; Jesse M. Jones, field agent, Department of Agriculture, Washington, D. C.; Dr. T. C. Atcheson, Agricultural Department, University of West Virginia, Morgantown, W. Va., and W. H. Kendrick, state agent, Boys' Agricultural Clubs, in connection with the University of West Virginia.

The prizes given were the same as in former years, namely: $10 for the best kept gardens and $5 for the second best kept garden; and $5 for the best kept yards, at each of the twelve plants of the company. The awards for carefully kept yards went to 6 Hungarians, 3 Americans, one Slav and one Italian. The awards for good gardens were granted to 5 Hungarians, 2 Americans, 2 Italians, one Roumanian and a negro. The gardens were better than ever before despite the dry weather in May and June. The committee found at least 1000 gardens on the property of the company worth, in aggregate, at least $40,000.

A Fine Coal Year in Virginia

The production of coal in Virginia in 1913 was 8,828,086 short tons, valued, according to E. W. Parker, of the U. S. Geological Survey, at $8,952,653. Virginia broke all previous records during this year in the quantity of coal produced, and for the first time in six years the value of the output per ton exceeded $1.

The quantity of coal produced exceeded that of 1912 by 981,430 short tons, or 12.5 per cent., with a gain in value of $1,434,077, or 19 per cent. The quantity of coal mined by machines increased a little over a million tons. The average number of working days was exceptionally large, while the average production per man reached nearly 1000 tons for the year.

The bad practice of shooting coal off the solid was reduced to the extent of nearly a million tons, compared with 1912. The number of fatal accidents was lowered by a little more than ⅔, and there was not a single strike or lockout reported. This record bears on its face the evidence that the year was exceptionally gratifying.

For several years Virginia has stood relatively high in the coal produced by each man employed, and 1913 was no exception to this rule. The number of men engaged in the coal mines of the state increased from 8678 in 1912, to 9162 in 1913, and the average working time from 251 to 280 days. The average production per man in 1912 was 904 tons, and in 1913, 963 tons. The average daily production per man was slightly less in 1913, being 3.44 tons against 3.6 tons in 1912.

The most gratifying part of the record of 1913 was in the reduction of the number of fatal accidents. In 1912, 75 men were killed in the coal mines of Virginia, and in 1913, there were but 24 fatalities.

Lignite Deposits in North Dakota

Few parts of the United States have enjoyed a more rapid agricultural development than the region along the North Dakota and South Dakota state line, from the Missouri River westward.

In the settlement of this region, lignite has proved a great boon. The country is mainly treeless, and homesteaders are, as a rule, of scanty means, and the lignite is practically the only fuel available.

This region was recently examined by the U. S. Geological Survey, which found that the lignite beds are, for the most part, thin and of little value, but will furnish considerable fuel for local use. In many places, these measures are not over 18 in. thick, but have been mined for local use by stripping off the overburden of shale and sandstone.

In some parts of the field examined, the lignite beds are much thicker, in one place as much as 13 ft. Here mining is carried on by drifts, and, in one instance, by a shaft. The most important mining centers at present are near Haynes, on the Chicago, Milwaukee & St. Paul Ry., in Adams County, and near Leigh on the Cannon Ball Branch of the same road in southwestern Morton County.

The government report on this field, containing maps showing the distribution of the lignite and a general description of its quality may be obtained from the Director of the U. S. Geological Survey, Washington, D. C.

The Militia in the Colorado Labor War

SYNOPSIS—The militia of Colorado has been freely condemned by partisans and unthinking people. The Ludlow battle has been described as an attack by an overwhelming soldiery on an unarmed people, whereas it was simply the successful defense of a greatly depleted force of militia fighting against a rabble of southern Europeans who had learned that the troop they had to meet was ill able to protect itself. This attack was made in the face of a promise that violence would not be committed. Acting on this assurance the few troops still in the field were being withdrawn.

The newspapers have declared that women and children were burned, and shot down by the National Guard of Colorado or by the mine guards at Ludlow, but this is wholly untrue with but one possible exception. One boy, who rushed in between the brave defenders of the state and the serried ranks of armed anarchy, was killed. It is not impossible that the boy's death may have been due to a bullet from the guards.

Judge Ben. B. Lindsey stated in Chicago that the boy was beheaded by the militia and that the head was hurled at the boy's father when he asked for the body. After Governor Ammons had branded the story as false Judge Lindsey sent a feeble denial of the interview in which this statement was made.

THE FACTS ABOUT LUDLOW

Instead of Ludlow being the scene of a massacre it was rather the setting of a deep-laid plot by leaders of trained Greek soldiers, fresh from the Balkan war, to massacre a detachment of 44 national guardsmen left in the field for a day or two after the order of recall by Governor Ammons. The story of the gallant defense of their position against ten times as many men who had either been hired by the United Mine Workers of America to murder the guard, or who had gotten beyond the control of that organization, will compare in heroism and fortitude with the defense of the Alamo against the Mexican army. In position to mow down their enemies as they deployed over the level land from the tent colony to the railroad cut, this handful of guardsmen obeyed the order of Major Hamrock not to fire until fired on and permitted the armed enemy to gain cover from which they could fire on the uniforms and against the sovereignty of Colorado.

Six of these guards were boys of 18 years of age, students of Colorado colleges. Governor Ammons had called home the main force at Ludlow, and these were left to gather up the camp equipment and stray cavalry horses. But another week and General Chase would have had them out and on their way home. Governor Ammons had recalled the troops, under a pledge of peace arranged by John R. Lawson, Executive Committeeman of the United Mine Workers, specially in charge of the strike by orders from Indianapolis, and by other officers of the United Mine Workers. Beset by disloyalty in the State Capitol and a powerful and venal press in the city of Denver, harassed by the fact that the state was without funds to carry on the public defense, and suffering from attacks of illness, Governor Ammons listened to the promise of the strike leaders and the advice of powerful public men and private citizens, and agreed to remove the troops and did so—only this little detachment remaining in the field.

THE "STRIKERS" AND THE MILITIA

But the situation is best approached by recalling some events prior to the Ludlow battle. When the troops arrived in the disturbed district, Oct. 29, 1913, the strikers encouraged by their leaders had the hypocritical grace to welcome them.

THE MILITIA IN ACTION ON WATER-TANK HILL NEAR LUDLOW, COL.

MAJOR WILLIAMS, JOHN LAWSON, LOUIS TIKAS AND A CITIZEN

The strikers were afraid or pretended to fear the handful of mine guards engaged by the coal companies. Every train was adding, to the numbers of "strikers," men who had left Colorado a year or two ago to fight in the Balkan war or other gun men hired to become "miners" or "strikers." Many of them, like Louis Tikas, the Greek, the proprietor of a bootblack establishment in Denver, had never done a day's work in a mine. Already Robert Lee, marshal of Segundo, had been killed by strikers and numerous parties beaten up. The sheriffs and other officers of the counties had appealed for troops, saying they were unable to preserve life and property against the attack by the United Mine Workers of America.

DESTRUCTION OF SOUTHWESTERN MINE

Adjutant General John Chase established Trinidad and Walsenburg as his bases. On the night of the arrival of the troops, a band of men went to the Southwestern mine, an independent plant owned by J. W. Siple, H. D. King and John Vail, citizens of Colorado, poured oil on the tipple and mine buildings, set them on fire, and destroyed the property. After a long time arrests were made for these acts of arson, but the activity in prosecution was only because the post-office at the Southwestern mine was destroyed at the same time as the town and mine and the federal authorities were

Note—This article is based on one by L. C. Paddock, which appeared in the "Daily Camera," of Boulder, Colo. The illustrations are from photographs furnished by him for our columns and are the same as appeared in the publication mentioned.

the parties which acted. The district attorney of Las Animas county, either through fear or from his strike sympathies, had neglected to do anything.

The Southwestern was not a John D. Rockefeller property and the improvements valued at $60,000, were expended on it by Mr. Siple and his associates. All this went up in flames, entailing a total loss of surface improvements, flooding the mine with water, and necessitating great future expense in restoring the property to working condition.

THE FOREIGNERS KEPT THEIR GUNS

General Chase, moved by the assurance of Lawson and others that they would disarm their followers as soon as the mine guards were disarmed, proceeded to take the arms of the latter. This was easily done, as he says in his able report to the congressional committee, "Upon the Occupation of the Coal Strike Zone of Colorado."

"They were assembled by their employers and promptly turned over the high-powered rifles." . . . "I disarmed the mine guards and the employees of the operating companies in every camp throughout the entire strike zone, and speedily and easily finished the complete disarmament of that side."

General Chase was promised specially by Lawson that the strikers would now surrender their arms. Troops were marched to Ludlow—the largest tent colony in the strike district—and they were received with open arms, but those were not the arms which were wanted. He continues: "Many of the men were in the strange costumes of the Greek, Montenegrin, Servian and Bulgarian armies." Gen. Chase's report did not include the battle of Ludlow and other terrible affairs occurring after the withdrawal of the troops, but that he had prescience of what would occur is shown by this passage:

"We passed by Ludlow, occupied the Berwind and Hastings canons, and then returned to the colony to receive the surrender of the hundreds of high-power rifles I knew the strikers possessed. At this point occurred the first instance of bad faith on the part of the striking people. Expecting to receive hundreds, if not thousands, of arms, there were delivered into my possession some twenty or thirty weapons, many of them of obsolete pattern, the strikers topping off the humor of the situation by including in the delivery of arms a child's toy pop-gun. Since that time the recovery of the strikers' arms has been attended with the greatest difficulty; it has been a game of hide-and-seek, and while I have been able to recover, from various hiding places, a large number of high-power weapons belonging to the union, I will state that there are hundreds of guns still concealed and waiting occasion for use. Such weapons as I have received from this source came in always a few at a time."

THE ATTACK ON UNARMED GUARDS

The troops were called into Trinidad on Oct. 31 to prevent the massacre of the mine guards who had been disarmed by General Chase, who assembled them at the Coronado Hotel preparatory to giving them safe escort out of the district. A great crowd gathered, threatening vengeance on the disarmed guards. Five or six hundred of the mob were there, and made no secret of their determination to "get" these unarmed men. General Chase says:

"Notwithstanding the promises of Mr. Lawson and other strike leaders which induced me to disarm the mine guards, they then rather gleefully assured me that they could not control their people and that the feeling among the strikers, thirsting for the blood of the mine guards, was such as could not be stayed by any influence of the leaders."

He ordered out infantry and cavalry on the streets of Trinidad and quelled an ugly riot. Against General Chase's statements are those of men imported to Colorado to stir up the spirit of class hatred, men imported to make this state the battle ground of international warfare upon society and rights of property.

GENERAL CHASE

And who is Chase? Leader of the citizen-soldiery in times of strife—he is a specialist in the treatment of the eye and ear, widely known for his skill in medicine and surgery; an occupant for a number of years of a chair in the State University Medical College; a man of scholarly attainments, of life-long devotion to the poor, to whom by the thousands in Colorado he has rendered professional services without pay—a builder in the times of peace and a soldier, every inch of him, in the time of war; a tender-hearted physician, a devoted and loving husband and father, and citizen who is peer to any other. The imperfect pacification of the coal regions was due to no fault of his.

The troops who were in the field were but few—600 at times, never more than 1200, and the territory they were compelled to pacify and hold in check is larger than the State of Connecticut. That so small a band did such successful work while it was in force in the field is a credit to its efficiency and energy.

To Seek Northern Coal

Mackenzie & Mann, of the Canadian Northern Ry., are equipping the schooner "Laddie," at St. John's, Newfoundland, to sail for Hudson Bay on a prospecting expedition in search of coal deposits. They wish to secure coal supplies in that area for utilization in connection with the Hudson Bay railroad now being built from Le Pas, Manitoba, to Port Nelson.

The Canadian Northern has a junction with the Hudson Bay road at Le Pas, and will probably also operate the latter railway when it is completed. The discovery and opening up of coal deposits in the Hudson Bay re-

gion would be of great importance in connection with the traffic expected to be developed by the new route. At present all the coal required by the steamship traffic to the Bay has to be taken there from Sydney, N. S., in sealing vessels. The coal required for railway construction has to be brought up via Winnipeg and Le Pas.

Provision will be made at Port Nelson for the storage of coal in large quantities, but the cost of freight from the present distant sources of supply will be heavy and the finding of coal deposits at any point comparatively accessible for ships plying on the Hudson Bay route would be of immense advantage.

A Great Coal-Stripping Operation

The accompanying view, which shows two steam shovels, is of the Elsworth-Klaner Coal Co.'s coal-stripping works, four miles south of Pittsburg, Kan. This is the most remarkable picture ever taken of the comparatively new industry of open-cut coal mining. It shows, besides the extensive works, the two largest steam shovels in the world. They are Marions, model 270, and were built especially for this work.

Compare the size of the giant shovel in the foreground with the string of cars or the two dinky engines. From the shovel in the foreground to the one farther back, it is a quarter of a mile.

The main booms of these shovels are 90 ft. long, and the dipper handles are 54 ft. long. The dippers, level full, will hold 5 cu.yd. of earth, and heaped up as they actually are at work, they hold 6 cu.yd., or 162 sq.ft. The shovels will plow a swath, at the beam's fullest swing, 105 ft. wide—will clean the coal for that distance. They each will strip a 30-ft. covering from an acre of coal in a month, and do it right along. They have been in operation nearly two years.

The shovels weigh 300 tons and cost $35,000 each. The freight on each one was $3000, and it cost $2000 to set them up and start to work. A crew of four men on the shovel and two ground men are required to run them. The coal they strip is from 3 to 3½ ft. thick. The picture was taken from the tipple.

Strip Pit of Elsworth-Klaner Coal Co., Pittsburg, Kansas

Firebrick Work

Writing in *Power,* Frederick L. Ray gives the following specifications for firebrick work:

All firebrick shall be protected from moisture, and shall be dry when used. Each brick shall be dipped in a thin fine clay wash, rubbed and shoved into its final place, and then tapped with a wooden mallet until it actually touches the brick below it. The use of clay thick enough to lay with a trowel will not be permitted.

The walls of fire and red brick shall be carried up together. Furnace linings shall be laid with four courses of headers and then one stretcher backed by a firebrick header. Furnace center walls shall be of solid firebrick. Walls with 4½-in. linings or all red brick walls shall be laid with each header course on the inside of the wall lapping over a header course in the center of the wall, which in turn laps above a header course on the outside.

Points to Be Observed in the Building of Fire Arches

If fire arches are called for by the drawings, the skewbacks shall be laid off parallel and at the same height with a straight-edge as long as the arch. The skew shall be a true surface, cut only on the ends of the brick. There shall be firebrick back to the buckstays on single settings, and entirely through the center wall on battery settings.

Batten strips for the arch centers shall not be more than 2 in. wide. Selected brick only, smooth, straight and uniform, shall be used in the arches. Brick shall be laid dry without any clay; and shall be shoved together close and tapped with a wooden mallet on the flat side only of the brick. They shall be laid in courses along the arch center, beginning at the rear end of the arch, not in rings, and with every joint broken, and with a bond equal to one-half of the brick.

The first course shall start at the skewback on each side with a standard brick 4½ in. wide; the second at each side with a "flat back" 6½ in. wide; the third course 4½ in. and so on. To finish the courses at the front wall, a "flat back," cut to suit when necessary, shall be used. Each course shall be tried in place dry, and shall be checked with a straight-edge to insure all the brick of one course being the same thickness.

Bricks not of even thickness must be cut and rubbed. A course of wedges shall be used only when necessary to keep the bottoms of the straight brick in even contact with the arch center. If the use of wedges does in every case bring a straight brick to an even bottom the straight brick should lean away from the center of the furnace rather than toward it.

The Keying Course Should Be a Trifle above Arch Ring

A trial ring shall be laid, when about two-thirds of the arch has been completed, to determine if the keying course will fit. If cutting is necessary to fit the keying course, the key brick shall not be cut, but instead, the two adjacent courses on the side of the brick away from the key. The keying course shall be a true fit from top to bottom, of such thickness that when driven it shall not be below the surface of the arch, and shall preferably stand about ¼ in. above it. The keys should drive from 1 to 2½ in.

After fitting, the keys shall be loosely replaced, and then with a piece of wood, at least 2x4 in., extending the full length of the keying course, shall be driven uniformly to place with a heavy hammer, used along the entire length of the timber. After driving, the keys shall not show any crushing. When keyed up the top of the arch shall be thoroughly washed with a thin fireclay wash.

Centers shall be built so that they can be dropped down free of the arch after it is keyed, and removed from the setting without being burned out.

The New K & E Stadia Circle

The subsequent computations necessary to reduce observed stadia readings to the correct horizontal and vertical distances have long been a source of trouble and labor to the surveyor. Many arrangements, such as charts, tables and slide rules, have been devised to minimize this work, but all have been somewhat complicated and have presented a fruitful source of error. For this reason, stadia measurements have not found the universal application which their accuracy and convenience would presuppose.

In the new K & E stadia circle, an arrangement is presented which will undoubtedly stimulate the use of stadia measurements in all branches of surveying. Not only does it facilitate the taking of field notes, but it reduces the calculations of these notes to the simplest arithmetical processes, and, furthermore, the arrangement does not encumber the instrument with complicated and delicate equipment.

The usual method of taking stadia measurements is to observe the interval intercepted on a rod by the stadia hairs and the angle of depression or elevation of the telescope. With this data the observer is then enabled, by using the formulas $H = S \cos^2 a$ and $V = \frac{s}{2} \sin 2a$, to compute the correct horizontal distance and elevation of the point in question. The mechanical

The New Keuffel & Esser Stadia Attachment

means devised for the solution of these formulas have greatly simplified the plotting of notes, but their use still involves considerable labor and necessitates the carrying of extra equipment into the field.

Description of the Device

The K & E stadia circle is a modification of the regular transit circle whereby the degree graduations on two opposite segments are replaced by special graduations which give directly the per cent. of the observed stadia distance represented by the horizontal and vertical components. The accompanying illustration shows the simplicity of the new arrangement.

Through an arc of approximately 60 deg. at the right- and left-hand sides of the circle, the degree graduations are replaced by the special stadia graduations. At the index marked "Hor." is read the percentage factor to be applied to the observed stadia distance to obtain the correct horizontal distance. At the index marked "Vert." is read the percentage factor to be applied to the observed stadia distance to obtain the difference in elevation between the rod and instrument. Complications in the

calculations are avoided by bringing the center cross hair of the telescope to the target or mark on the rod, which has been placed at the instrument height before reading H. and V.

Example—Suppose the observed stadia distance to be 480 ft., and the telescope, when sighted on the target, to be inclined at such an angle that the reading at the Hor. index is 0.97 and at the Vert. index 0.17. Then *the correct horizontal distance* would be $480 \times 0.97 = 465.6$ ft., and the *difference in elevation* would be $480 \times 0.17 = 81.6$ ft. The very simplicity of this arrangement would seem to raise doubts as to its accuracy, but the position of each special graduation is theoretically correct, and exhaustive tests of the instrument throughout the full range of the stadia graduations have proved it to be practically free from error.

Over a long series of tests by different observers, the average error in the reading of the horizontal correction factor was found to be 0.05, which in a 500-ft. sight would introduce an error of 0.25 ft. in the computed horizontal distance. The same trials applied in the reading of the vertical correction factor disclosed an average error of 0.02, which in a 500-ft. sight would introduce an error of 0.10 ft.

By the method of least squares the average error in reading was computed to be:

Vertical ± 0.07
Horizontal ± 0.09

These larger errors, in a 500-ft. sight, would affect the computation of the horizontal and vertical distances by ± 0.45 and ± 0.35 ft., respectively, and as the allowable error in stadia work is 1 per cent., it will be readily seen that this compares favorably with any method now used.

The greatest advantage of the device, however, lies in the rapidity with which field notes and the subsequent calculations can be made.

When dealing with a mine fire—Promptness is the cardinal virtue. An incipient blaze may sometimes be beaten out with a coat, cap or shovel. The use of water to fight even a small mine fire is generally a dangerous proceeding, as the heat turns the water to steam which blinds, scalds and otherwise hampers the fire fighters. It is also sure to cause falls of roof. Sealing a mine is the last resort as it is expensive and slow in producing results. Many coal companies find it advisable to have on hand a chemical engine for extinguishing mine fires by the use of carbon dioxide, the most efficient fire extinguisher now known. Bi-carbonate of soda dissolves easily in water, sulphuric acid added to this bi-carbonate solution generates dioxide rapidly. Such an engine may be constructed by placing two alternating 80 gal. capacity steel tanks on a mine truck. One discharge hose, 200 to 300 ft. long, gives a steady service. When one tank is empty close the discharge valve, and use the other tank, immediately recharging the empty tank. The water carries the soda to the fire where the heat liberates the gas, which, together with the large amount of free gas accompanying the steam passing from the engine, soon makes its presence felt on the fire. Keep the nozzle of the hose as near the fire as possible. Very little water is used, therefore, but little steam is generated. The heavier than air carbon dioxide remains on the surface of the fire cutting off its supply of oxygen and smothering it.

The Compass That Will Point the Wave-Tossed Ship the Right Direction

The Labor Situation

SYNOPSIS—The progress toward settlement in Ohio is the main subject of interest. In the Southwest the miners have struck against the wishes and orders of the Union. They refuse to work until a new scale is made. More mines are starting in Colorado. The shortage of men caused by the war, is not so severe as was expected.

Labor troubles in Ohio are on a fair way to settlement except in eastern Ohio, where there is still a wide gap between operators and miners. During the past week, the parties in contention in the Crooksville district settled their working conditions, and arrangements were made to resume mining Aug. 10. This district produces a large amount of coal.

The conference of operators and miners in the Pomeroy district continued during the greater part of the week, with the result that practically half the district resumed work Aug. 10. The bone of contention in those mines in the section which is still idle is a differential of 4c. on the pay for "brushing." Miners are insisting on this differential, while the operators are loath to pay it.

MASSILLON SPLITS

In the Massillon district, a split occurred in the ranks of the operators. The Peacock Coal Co., which is one of the larger operators in that district, signed up with the miners at 47c. for machine-mined coal, and work was resumed. Other operators have not yet signed up. The meeting of miners and operators at Massillon broke up Aug. 6, no day being appointed for further discussion. The miners are willing to let any operator work who will pay 71.19c. per ton for pick-mined run-of-mine coal.

In the Hocking Valley and Jackson fields, preparations are being made to put all the mines in operation. Many started last week, and the work of getting others in shape for working has been rushed. The same conditions prevail in the Cambridge district.

THE BITTER DIFFERENCES IN EASTERN OHIO

In the eastern Ohio district, a conference of operators and miners held at Wheeling, W. Va., produced no tangible results. This was a meeting of subdistrict No. 5. President C. J. Albasin renewed the demands for a rate of 47c., which was promptly refused by the operators, led by T. K. Maher, of Cleveland. President John Moore, of the Ohio miners' organization, then invited the operators to sign up individually with their miners at the 47c. scale, and this was followed by C. E. Maurer, of the Glenns Run Coal Co., inviting the miners to sign up at the last year's figures. He was hooted and threatened by the miners.

The miners, it was believed, were prepared to make concessions. It was thought that they would not have called a meeting if they had not been so disposed. But it was soon found that neither side was prepared to give way. The matter was not even submitted to a scale committee, but was discussed before all the operators and delegates. It is said that the representatives of the former numbered nearly 200, and that 300 miners' delegates were present.

The operators and miners both feel confident that the unanimity in the ranks of their opponents is only apparent The operators think several miners will go back to work for 41c., and several of the union men expect many operators to open their mines and offer their men 47c. Why there is this feeling of confidence in the lack of coherence of the opposing sides is hard to determine.

The miners are desperate. Since the strike on Apr. 1, they have received the large sum of $160,000 from various sources, but as there are 16,000 of them, that is only $10 per head, or about 8c. per day. Now their credit is gone and their sympathizers are tired of giving, they have nothing to live on and the feeling toward them has been extremely bitter, for many of the less worthy of them have not hesitated to take anything which was eatable, even livestock.

The Bergholz district in Columbiana County is expected to resume work as soon as eastern Ohio operators arrange with their men. It is said that the Fort Pitt mine is to be closed down for a year. The fires are being drawn from the boilers. The machinery in the mine will be removed and the workings will be allowed to fill with water and gas. It is said that the company fears that coal shipped to Canada will be declared contraband and that consequently coal in Ohio will be limited in sale.

Many of the foreign miners are looking hopefully to the European war to give them employment, and some have been forwarded transportation money to take them to New York City. But this only serves as a solution for those who are citizens of the fighting nations. It seems as if the rest must starve or give in. Albasin, who accepts neither as an alternative, is about to make a trip to the anthracite region on behalf of his men. A sum of $25,000 was distributed on Aug. 4, each man receiving about $1.50. Prior to that, there had not been a distribution of funds for some time.

A UNION MAN'S ACCOUNT OF THE ARKANSAS TROUBLE

There are no developments in Arkansas, but we have a letter from a union sympathizer, as just a man as you would want to meet, though he evidently regards a nonunion man as a criminal. He gives us some details of the violence. He assures us that as far as he knows the cause of the trouble was Franklin Bache's determination to run his mines nonunion. He "ordered his men to square up their places and take their tools off the premises last March. The contract between the men and the company did not expire until July 31, 1914." He does not state whether the union men had or had not kept their contract. On the degree of their fracture of contract requirements, Bache's action must receive or evade condemnation.

On Apr. 1 our informant says "the mine was opened with scab labor; the union miners captured the mine and ran the scabs away. The mine was opened again under guard, and they started to hoist coal July 15. On July 17, the union miners captured the mine again and destroyed everything in sight, including No. 1 Mammoth Vein, No. 3 Mammoth and Coronado No. 1.

"No. 4 is a shaft opening, 250 ft. deep; the coal is 7½ ft. thick; the output is 800 tons daily. No. 3 is a slope opening connected with No. 4. The two mines Nos. 3 and 4 were those being operated with scab labor. No. 1 Mammoth Vein is a slope opening 4000 ft. deep (?); the coal is 7½ ft. thick and dips about 8 deg. The output of the mine is 800 tons daily. No. 1 of the Coronado Coal Co. is a shaft opening, 200 ft. deep. The coal is 7½ ft. thick and the output 600 tons daily. The tipples were all of wood, but far better than those published on page 176 of this volume of 'Coal Age.'

NEED OF TROOP DEFENSE

"The amount of coal shipped during the time the mines were operated 'open shop' was 162 tons and the aggregate cost was about $3000 per ton. Feeling still runs high here against nonunion men, and it would not surprise me to hear of the Johnson County nonunion mines having a similar experience. This is a strong union country and I do not believe that a mine can be operated 'open shop' without a standing army to guard it. The Penn Mining Co. and the Sterling Anthracite Coal Mining Co., located at Clarksville, Johnson County, Ark., are the only mines in the state operated 'open shop.' They employ about 400 men at the two mines.

IS BACHE TO BLAME?

"My opinion is that Bache brought all this trouble on himself, by refusing to treat with his employees and summarily discharging all of them and ordering them off the premises. I believe their differences could have been settled if an attempt had been made to do so."

We quote this letter without comment, much as we regret the point of view. It reminds us of the remark facetiously placed in the mouth of a street-car magnate, who, seeing a poor fellow ground to pieces by the cars, said: "Serves him right; why was he walking?" Similarly in the view of our correspondent, "Serves Bache right; why didn't he employ United Mine Workers and thus prevent his property from arson and defend his men from rifle bullets?"

The court has reopened the case charging contempt of court against P. R. Stewart and others in connection with the attacks of the miners and their leaders on the mines of the Bache-Denman interests.

THE STRIKE IN THE SOUTHWEST

Throughout the Southwest, a strike has taken place. Only 10 mines in Kansas remain at work. The old contract expired July 31, and the men refuse to work till another takes its place, despite the efforts of the union to make its settlement without a suspension. Some weeks ago, the operators and union officials signed the interstate contract, but the district agreements have not yet been signed.

It appears that each mine will make its own settlement in Arkansas, Oklahoma and Texas, but in Kansas and Missouri, the contracts will be general and not individual.

THE ANTHRACITE CONCILIATION BOARD

In the anthracite region, the legal value of the decisions of the Anthracite Conciliation Board is in question. It seems very clear to the average bystander that men who contract without stipulated wage would get what the board provided, but that it would be possible to contract legally for more or less than the rate determined by the board.

A case before a justice of the peace of Audenried, on Aug. 4, is claimed by miners' leaders to be a test of the legality of the findings of the Anthracite Conciliation Board and of the agreements which have since been entered into by the men and companies of the anthracite region.

Two laborers of the Yorktown No. 2 colliery brought suit against the miners employing them for the difference between $2.26 a day, which they have been paid, and $2.84 per day, which they claim is the rate fixed by the commission and subsequent agreements entered into by the companies and the men.

The justice gave judgment in favor of the plaintiffs. The defendants filed an appeal. The case is of interest to all persons employed about the mines. The court will take testimony during the October term.

WEST VIRGINIA'S INTERNAL TROUBLES

In West Virginia, it is reported that a strong movement designed to displace Thomas Cairns, president of the United Mine Workers of District No. 17, and his assistants has been discovered, and that it has failed. The insurgents charged that Cairns and others did not abide by the instructions from the district convention in their dealings with the Kanawha Coal Operators' Association, and that in other ways they did not act in good faith. It is understood, however, that a convention called to take steps against the union leaders in response to their charges was not held because of a lack of sympathy with the movement on the part of the men.

MORE COLORADO MINES OPERATE

In Colorado, the Rockland mine of the Walsenburg Coal & Mining Co., employing 75 men, resumed operations on July 31 and will operate on the open-shop basis. The mine has been closed since the strike was called. The Gordon mine has started operation under a contract with the United Mine Workers of America. Both mines are graciously permitted to work under an order of the War Department, a decision having been made by the Secretary of War.

Peter Catzoulas, a leader of the Greeks, who replaced the bootblack padrone, Louis Tikas, at the Ludlow tent colony, has been arrested, charged with murder in connection with the death of nine employees of the Rocky Mountain Fuel Co. at Forbes on Apr. 28.

THE SCARCITY OF LABOR

There will probably not be a great reduction in the labor forces of the country due to the European war. The people most anxious to take part are the Serbs, Austrians and Germans. It is hard for either of these to find their way into Europe at this time, and this condition has discouraged enlistment. Most of the other foreign workmen are only too glad to be free of the necessity, and, as for the subjects of Great Britain, they could not be compelled to serve even if at home, and are little disposed to show their patriotism by active service.

The most menacing feature in the situation is the possibility that Canada, wishing to save money, for she pays larger wages to her soldiers than any other people, and anxious to spare the lives of her citizens of British birth, may establish a foreign legion and give the Serbs, Greeks, Bulgarians and a few French and Belgians a chance to serve. This has been proposed, but it seems unlikely, and even then it could not seriously affect the labor market.

In fact, with the slackness now universal, we would lose but little, and many of those lost would be those who could go without our grieving. Ludlow, for instance, might be depopulated of its trouble makers. The only fear is for the time when the return takes place. Then the work of Americanization must commence all over again, and if we have a strike at that time, these warriors may establish themselves in new tent colonies and harass those who are willing to work.

FOUR-DAY WEEK

The Scottish Miners' Union has decided that after July 27 all members must work only four days a week. The production of coal is being limited so that all will have work. The employers desire to lower wages from $1.75 to $1.46 per day; they even threaten a lockout in which 100,000 men will be involved. The wages in Scotland are not as good as those in Wales, owing to the inferior quality of the coal and the difficulties in mining.

Efficiency Contest

Officials and employees of the Lehigh Valley Coal Co., to the number of more than 700, attended the annual employees' outing at Hazle Park on Aug. 8. In the morning there was a business session. The men are organized as a social and beneficial society. The following officers were reëlected: President, Supt. G. T. Gallagher, West Pittston; vice-presidents, A. M. Allen, Hazleton, and Patrick Loughlin, Centralia; secretary, Edward McKernon, Hazleton; treasurer, W. S. Freegans, Kingston.

The rock-drilling and timber-splicing contests, the 100-yd. dash, a boat race and shotput made the most interesting part of the day's events.

The rock-drilling contest was won by the team from the Lehigh Division, August VanBlargun and John Krynak. The second team in the race was John Ryan and Edward McShea.

The timber-splicing contest was won by the team from the Mahanoy and Shamokin Division. The members of the team were William Hovenstein and Elmer Daniels. Their time was 11 min. 55 sec. The Lehigh Division team was second. The members of the team were Henry Foose and Solomon Wetzell. Their time was 12 min. 42 sec.

The surveying contest was one of the new features of the day. Various surveying corps, representing the separate divisions, worked out a given surveying problem. Time and accuracy were considered in the judging, accuracy being placed first and speed second. The corps representing the Lehigh Division was first. The members of it were Edward Bachman, William Rohrbach, H. A. Kilde and Fred Holderman. The corps' average was 93 per cent.

Edward Tudgy, of Warrior Run, Wyoming Division, won the 100-yd. dash. Edward Reese, of the Lackawanna Division, won the shotput. He threw the shot 29 ft. 4½ in. Thomas Farrell, also of the Lackawanna Division, was second.

The boat race, twice around Hazle Park in a rowboat, was won by the Lackawanna Division, with Aleck Bryden as oarsman and Frank Smith as his passenger. Edward Stevens was second.

John A. Redington, proprietor of Hotel Redington, of Wilkes-Barre, served lunch at noon. A troop of boy scouts who were on the ground were also taken in for lunch.

Splitting an Air Current

Splits should start as close to the downcast shaft and terminate as close to the upcast shaft as possible. The advantages of splitting an air current are as follows:

(1) Each district is supplied with its own air current, traveling at a reduced velocity, thus meeting with little resistance. (2) Purer, fresher air, less polluted by gases. (3) Larger volume of air with the same power on the air. (4) Each split a complete and independent ventilating system. A fire in one split cannot be carried by the ventilating current into another split. When the velocity of the air is insufficient to remove gas found in the radius of its influence or when the combined resistance of the splits exceeds that of the shafts, then splitting has been carried too far and the end sought has been defeated. Splitting should be uniform. The amount of air passing into the various sized splits should be in proper proportion or the short districts will absorb more than their share, as the quantity of air taken up by each split depends on the length and sectional area of the split.

Who's Who in Coal Mining

Frank D. Rash

Over in Kentucky is a real live Mine Owners' and Operators' Association, which breathes the breath of health and progress. It owes its rapid and successful growth chiefly to its humanitarian principles.

Safety first, forebearance, power to the weak, coöperation with the strong and partiality to none are among the ingredients of the tonic which has braced the legs of this young organization for the good race. And its broad-minded policies have, mind you, marked it as a body amply fitted to keep pace with the output of the Kentucky mines, which, by the way, have pulled on their seven-leagued boots and turned tail upon their past performances.

Frank D. Rash

At its annual meeting, not long since, the association cast a lingering eye over its membership with the intention of selecting a president for the coming year. The lightning of fate struck upon the unsuspecting head of Frank D. Rash, and approval echoed from the entire industry of the whole state.

Mr. Rash hails from one of the older coal fields of America, that of western Kentucky, and here it was that he gained his sympathetic training in the school of the square deal. Forbearing patience, advice that encourages, appreciation of service are some of the traits which have won for him a warm place in the hearts of his men.

Graduating from the Massachusetts Institute of Technology in 1901, Mr. Rash entered the engineering department of the St. Bernard Mining Co., at Earlington. Concentration and industry soon established him as chief engineer, from which position he became general manager. He now bears the title of vice-president and general manager.

As an expert on industrial legislation, he last spring took an active part in coöperating with the committee framing the new Industrial Compensation Act and the Kentucky Mining Laws as they now stand. These measures were adopted by the Kentucky Legislature.

Mr. Rash is also the first vice-president of the Kentucky Manufacturers' and Shippers' Association, and just recently relinquished the honor of being the second president of the Kentucky Mining Institute. He is also a member of the American Institute of Mining Engineers, the Engineering Association of the South and a charter member of American Mine Safety Association.

Among the most notable of Mr. Rash's contributions to the scientific press are his articles on "Forestry as Related to Mining" and "What Is Necessary to the Proper Development of the Kentucky Coal Fields."

Prize Gardens in West Virginia

With the award of prizes, for the beautifying of their homes, to the miners of the Gulf Smokeless operations, at Tams, W. Va., that company enters a movement which is rapidly spreading through the New River, Winding Gulf and Pocahontas coal fields of West Virginia.

Some time ago W. P. Tams, the general manager of the above company, announced that an inspection would be made on July 1 of the houses and yards of those miners who wished to enter the contest. The prizes were to be $15 for the best garden in that section of the town where the white miners live, $12 for the next best, $10 for the third and $8 for the fourth. For general appearance of premises there was an award of $15 for first prize, $12 for the second and $10 for the third. The same prizes were offered for the best gardens in the colored section.

On July 1 a committee of three men and two women from the town of Beckley, none of them being in any way connected with the coal business, made a thorough inspection of the premises of the contestants. It might be said, in passing, that nearly every householder in the town was a contestant.

The committee had no easy task to make the awards. Every house was clean and neat and a source of pride to the housewife and of congratulations on the part of the committee.

White Section—Best Garden

J. K. Fisher, first prize	$15.00
J. A. Mawhinney, second prize	12.00
H. T. Roberts, third prize	10.00
Premo Platti, fourth prize	8.00

For General Neatness and Appearance of Premises

W. M. Spencer, first prize	$15.00
J. K. Fisher, second prize	12.00
J. E. Sowers, third prize	10.00

Colored Section—Best Garden

Harry Franklin, first prize	$15.00
Ellis Eubanks, second prize	12.00
J. C. Burke, third prize	10.00
Daniel Ford, fourth prize	8.00

For General Neatness and Appearance of Premises

Harry Franklin, first prize	$15.00
J. J. Steel, second prize	12.00
Harry Alderson, third prize	10.00

In order to encourage the miners to enter the contest and beautify their homes and to put everybody on an equal footing, the operators furnish all the fertilizer necessary and do whatever hauling is needed. Other operating companies are making similar offers of prizes under similar conditions and many of the mining camps in the three fields are in better condition than they have ever been before.

Editorials

A Self-Sustaining Country

The dreadful events of the past few days in the European war are most depressing; however, the one fact we should not lose sight of is that we are at peace with the whole world, and we are able to supply ourselves and others with the needs of mankind. No matter what the outcome in Europe may be, the United States will continue to raise wheat, corn and cotton; we will have plenty of beef and pork and our mines will still produce iron, coal, gold and copper. Nothing could be more appalling than the calamity that has befallen the peoples of Europe, but Americans can go ahead and live and work even if the conflict abroad should last for years, which, by the way, is unlikely.

England became great largely through its isolation in a former European war; there is no reason why America should not emerge from the present world disaster with the advantage entirely on her side.

The Verner Theory

The Verner theory about the counter air current in a mine explosion has gradually gained strength, though it still has silent though powerful opponents. We have steadily published Mr. Verner's conclusions because we believed there was some evidence that they might be right even though perfect confidence in them was not possible.

Perhaps we did not feel any more certain of them when John Harger approved them, for Mr. Harger is a little disposed to be attracted by novelty for its own sake. We like him the better for that, though we are a little chary to follow his bold leads.

However, now John Verner has found at the Eskmeals station and in Samuel Dean most valiant defenders who saw visible evidences that his statements were true. We hardly believe that the procession and recession of the board in the mouth of the galley was vibratory. It seems almost certain that it had its origin in a counter draft.

We shall be pleased to hear what his opponents advance as the cause for the movements of the board. The article by Samuel Dean, "A Visit to the British Experimental Station at Eskmeals," will well repay reading, especially the short notes on the points of greatest danger in a coal mine, that is, the places where an explosion of dust may be most easily started.

Miners' Work and Wages

A study of the coal-company payrolls of today discloses interesting, not to say amazing, facts regarding the compensation of the rank and file of the mining industry. In looking over some statistical data of this nature, compiled from the records of one of the leading "hard coalers," we found some 300 men whose wages exceeded $65 for a two-week period. A large proportion of these men crossed the $100 mark, quite a number earned around $150, while one miner received the remarkable total of $190 for the two weeks' labor. These figures are net, after all deductions. They also cover a recent period with the coal markets at the low point of the year and operations consequently restricted to the minimum.

Further inquiry and analysis of the conditions under which the highest wages were earned failed to develop any satisfactory explanations. Skillful mining ability, supplemented by a moderate ingenuity and a consistent adherence to the work day by day, were the only discernible requisites. Nor does the work of these wage leaders involve the strained and continuously sustained endeavor that might be expected as the natural accompaniment of a high rate of compensation for the laborer in any walk of life. On the contrary, these men, as a rule, wind up their day at one or two o'clock in the afternoon except during slack periods, when they make up the deficiency by driving extra yardage until four o'clock.

And yet these same men are utilizing their funds, in many instances, educating their sons to become bank clerks. Inherited foremanships in the anthracite collieries have ceased to exist, as is evidenced by the fact that the company officials have been forced to the modern expedient of local mining institutes to shape up likely material for such positions. Assuredly the mining industry is rapidly losing caste.

Agricultural pursuits have in modern times been similarly forsaken for the veiled glamor of city life. But more recently, the tide has turned, and thoughtful men are awakening to a realization of the basic importance of the products of the soil in the world's commerce. How soon and by what means are we going to create a like reversal of sentiment towards the coal industry?

Turning to the purely economic aspects of the case, this relatively high remuneration makes a startling comparison with that of other classes of wage earners. The mining, or digging of coal, at its highest development scarcely falls within the scope of "skilled labor," as does that of plumbers, electricians, locomotive engineers, etc. In any event, the highly trained man in these lines would certainly resent the comparison even though it be evident that his opportunities for material gain are substantially less.

As compared with the prevailing rates of compensation for professional and scientific men, the results are even more striking. In spite of James J. Hill's pertinent apothegm: "It is not the high cost of living, but the cost of high living," it is becoming increasingly difficult for the average professional man, dependent entirely upon his salary, to maintain the appearance demanded by his position. Indeed, there is a glaring incongruity apparent here as regards the engineering profession. The engineer forms the buffer between capital and labor, the former crowding him for fatter dividends, while the latter brands him as a tentacle of the money octopus, and, in the recent increases in the cost of living, he has been too frequently overlooked.

The Bent Statement in Illinois

As related in last week's issue, Edward T. Bent, a member of the Executive Board of the First District in the Illinois Coal Operators' Association, and general manager of the Oglesby Coal Co., declared before the federal Industrial Relations Commission that the reason why working conditions in Illinois were better than in Colorado or Michigan were "because they (the union) licked us in 1896."

We do not know what made Mr. Bent and F. S. Peabody make such remarks as have recently been recorded. It may possibly be that they are seeking, as are almost all of the operators in union districts, to advance the cause of unionism in nonunion states. They feel they cannot do better than assure the public that the medicine they are taking is sweet and not bitter to the taste, so that the people, believing in its healthful qualities, will be disposed to subject the coal operators of Colorado and Michigan to a dose of it by forcible feeding. That is why they assure us that this involuntary nutrition is a joyous operation. We have known no patients who, in privacy, ever declared that they liked it. Some say, it is true, if the union were different, it would be a blessing, but no one says he enjoys it as it is.

Whatever the real opinions of Messrs. Bent and Peabody may be, and why may not some men see red and think it green? we are disposed to question the truth of their remark that the operators were licked in 1896. They were then barely making profits; they are in a perilously similar position today. Hence the increased wages of the miners did not come from profits, but from a raise in prices. In short, not Bent and Peabody, but the ultimate consumer retired discomfited in 1896.

Bent and Peabody may have carried the sword and worn the epaulettes, and they and their followers may have thought they were defeated, but the rank and file who buy coal and use materials manufactured with the aid of coal, the noncombatants, in short, were the people who were routed and have remained in that condition ever since. You cannot separate an army's interest from that of the nation which it is defending, and you cannot raise wages against the operator without injuring the consumer, unless the mine owner is really and truly robbing the public, and even then it is probable that he can go on doing it thereafter.

But perhaps it will be contended that the miners neither stole a march on the operator nor the consumer, and battled only for the right. The consumer, perhaps, had a right to suffer a defeat in 1896, for coal mining might not have been paid as much as such work merits. It is probably true that mining is not a pleasant trade; at least it is not so regarded, though miners once in it will not leave. It is true that it is considered unhealthful and dangerous, though it is probably unusually healthy and not as dangerous as generally supposed.

However, of all unskilled or partially skilled trades, it is the best paid. The rate of wage for men drawn from the working face at the will of the mine foreman is 60 per cent. higher than ordinary working wages of unskilled men on the surface. Outside daymen get at least 20 per cent. larger wages than ordinary transient day labor and have steadier jobs. There is reason to believe that organization has raised the mining wage above the average wages of workingmen of equal skill, and the ultimate consumer has been compelled to pay this larger wage.

If the mines become strongly unionized from the state of Washington to that of Pennsylvania, that price will be still further increased. We confess we have a great deal of sympathy for the deserving yet unclassified workingmen who, unlike the mine workers, are not allied with any extensive interest which can defend them.

These tradeless men, like the men in early England who were labeled "masterless" and were attached to none of the powerful guilds, are fit subjects for our pity in the midst of a number of powerful unions, numbered among which we must remember are those of doctors and the lawyers with a scale for every type of service.

Varieties of Unionism

As there is but one body of union men in the coal industry, the United Mine Workers of America, it is natural to think that there is a general character of unionism pervading the mining districts from end to end. But as a matter of fact, the difference is immense. In those districts where the union is established, men are desired by the executive who will quietly sit down on the lid and prevent discord. In such sections of the country the energy of unionism is all in the pit committees. The higher officials realize that from their men must come the special and regular assessments by which the treasury of the national organization is filled and by which attacks are made on the nonunion districts. That is why pacific men, almost statesman-like in their qualities, are favored in the pacific districts, and unquiet souls, with fiery ardor and a desire for a "scrap," are sought out for Colorado, West Virginia and like states as soon as any part is marked out to be unionized.

It is for this reason that operators like E. T. Bent prefer to deal with the men in authority rather than with the pit committee. Higher officials in the union realize that peace is forced on them if they ever hope to have the sinews of war. They know that a national strike in the industry can but mean a complete overthrow for the union, and understand well how a fund of $160,000 melts into $10 bills when 16,000 men have to draw on it, as in Ohio. This knowledge made John T. White an uncompromising foe to a strike in the central competitive districts and causes him to urge the men to keep at work in the Southwest at present.

But the pit committees and delegates see only their own immediate needs and would wreck the union to obtain their own ends. At Indianapolis, the latter declared that the leading officials were lacking in sympathy with the man at the face, and got a scale committee, as they thought, more in sympathy with their aims; only to find these men fail them as soon as the bare facts were presented. The new men proved as conservative as those they replaced.

Your chairman of the pit committee, glorying in his new-found dignity, dividing the resources of the union by the number of the men engaged in his little mine, argues for an immediate assault on the enemy. After a few weeks' travel about the country, he begins to see that the United States is very big and many men are mining coal and is told the union funds amount to little per capita. His friends hardly know him when he returns. He has the views of a capitalist and an economist.

Legal Department

Coal as Contraband of War

By A. L. H. Street*

SYNOPSIS—Coal is held by the law of nations to be contraband, and hence subject to seizure and condemnation, only when destined for military or naval, and not civil, use.

The prospect of continued war in Europe suggests several important questions of international law which have peculiar application to export shipments of coal and other fuel. As was said by Wharton, the eminent authority on the law of nations, long before the present war was foreseen, "the only points as to which we would be likely to come into collision with a European state are those concerned in the maintenance of neutral rights."

It is a well recognied principle of international law that citizens of a neutral nation may, within the bounds of their own country, sell to belligerents whatever belligerents choose to buy, subject to the exception that a neutral must not discriminate by selling to one belligerent and refusing to sell to another. (Moore's Int. Law Dig.)

Contraband goods destined to an enemy's port being subject to seizure and condemnation by a belligerent, although carried by a neutral, the question arises: Is coal contraband? Broadly defined, "contraband goods" are those which may directly aid belligerent operations, but accurate classification of contraband or not is impracticable, according to the decision of the United States Supreme Court in case of The Peterhoff, 5 Wall. 28, 58.

"But," says the court, "that which is best supported by American and English decisions may be said to divide all merchandise into three classes. Of these classes, the first consists of articles manufactured and primarily and ordinarily used for military purposes in time of war; the second, of articles which may be and are used in time of war or peace, according to the circumstances, and the third, of articles exclusively used for peaceful purposes. Merchandise of the first class destined to a belligerent country or places occupied by the army or navy of a belligerent is always contraband; merchandise of the second class is contraband only when actually destined to the military or naval use of a belligerent, while merchandise of the third class is not contraband at all, though liable to seizure for violation of blockade."

By both reason and authority, coal belongs to the second class; that is, it is contraband "when destined for a naval station, a port of call, or a ship or ships of the enemy." (Moore's Int. Law Dig.) In the case of Balfour, Guthrie & Co. vs. Portland & Asiatic S. S. Co., 167 Federal Reporter, 1010, the United States District Court for the District of Oregon cited a decision on the point that commodities of the second class, if destined to a commercial port, will be presumed to be going there for civil use; but not if they are going to a port of military equipment, and especially if there be a hostile armament then preparing there. Coal, if from the nature of the locality in the enemy's territory to which it was destined, might be considered to be intended for the use of the enemy's army or navy, was declared to be contraband under an order issued by Japan during that nation's war with Russia. And a retaliatory order of Russia declared that all fuel should be deemed to be contraband.

The following statement from the Oregon case above cited would seem to be applicable to coal as well as to provisions:

"Perhaps a mere declaration by a belligerent nation that articles of commerce are contraband, when by the rules of international law they are not, would not make them so. But here is a proclamation touching provisions that rest upon the border line, and depend for their real character upon the particular state of the port of their destination, whether engaged in civil pursuits only, or in equipping the army or the navy with war supplies. It would seem that, under such conditions, the proclamation of one of the governments at war would be effective to impress the provisions with the character of contraband."

*Attorney-at-law, St. Paul, Minn.

Recent Judicial Decisions

When Is Mine Owner Liable for Improvements by Lessee?—Where a lessee contracts with outsiders for unwatering of a mine, the owner is not liable for work done or materials furnished under the contract, unless he knew or had reason to know that the persons doing the work and furnishing the materials were relying upon him for pay. (Colorado Supreme Court, Reynolds vs. Norman, 141 "Pacific Reporter, 466.)

Shipper Chargeable with Notice Concerning Freight Rates—When a railroad company has published its freight rates on shipments between points in different states, a shipper is presumed to know what the true rate is in a particular instance, and cannot recover damages from the company for misquoting the rate. (United States District Court, Eastern District of Arkansas; J. H. Hamlen & Sons Co. vs. Illinois Central R.R. Co.; 212 Federal Reporter 324.)

When Offer Is Accepted—Where an offer to buy or sell is submitted by letter, an acceptance is conclusive and binding when a letter is deposited in the post office accepting the same. The delivery to the one making the offer is not the test; for when the offer is submitted in that way it is equivalent to an invitation to accept by the same means, and when the acceptance is delivered to the agency chosen by the one making the offer the contract is complete. And so, where the offer is by telegram, and the answer is by the same means, the contract is then complete. The risk of prompt delivery is upon the one selecting the agency. (Texas Court of Civil Appeals, Kenedy Mercantile Co. vs. Western Union Telegraph Co., 167 "Southwestern Reporter," 1904.)

Responsibility for Injury to Employee While Riding on Train—A mine repairman who was injured in a collision between trains operated by his employer, while riding with his legs hanging over the front end of a car, in violation of the employer's rules and of the Pennsylvania Anthracite Coal Act, cannot recover damages on account of the injury. Nor is the employer liable if the collision resulted from movement of the trains without authority from the foreman in charge thereof. It is further held that the mere happening of an accident, from which negligence of the employer might be inferred, does not establish liability on his part; an employee suing for injuries received must prove the specific act of negligence relied upon. (Pennsylvania Supreme Court, Dugan vs. Susquehanna Coal Co., 88 "Atlantic Reporter," 787.)

Somerset County, Penn., First-Aid Meet

The second annual Somerset County Miners' First Aid Meet was held on July 22 at Somerset, Penn., under the direction of the State Young Men's Christian Association, George B. Landis, of Harrisburg and A. W. Harris, of the Bureau of Mines being in charge. The use of oxygen helmets in rescuing miners from explosions was demonstrated in a brattice-cloth mine heading constructed for the purpose. In the three-man event, six teams tied on the first problem. Of these four remained after the second and on the third trial the Meyersdale team won. Messrs. Elmer Barnhart, David R. Spence and Clay Beynon demonstrating.

As is natural the greatest interest was shown in the team competition. The problems given were:

Shot-firer caught by flying coal, right eye injured, right collarbone broken, cut on right forearm. Improvise stretcher and carry.

Powder keg exploded, burning miner severely on face, neck, chest, back and both arms. Carry 50 ft. with improvised stretcher.

Man has a broken back from fall of roof. Improvise stretcher and treat.

In the average for these events the teams stand as follows:

1.	Somerset Smokeless, Boswell No 2	100
2.	Jenner-Quemahoning, Jerome No. 1	99⅝
3.	Consolidation Coal Co., Acosta No. 1	99⅝
4.	Jenner-Quemahoning, Jerome No. 2	98⅝
5.	Somerset Smokeless, Boswell No. 1	98½
6.	Consolidation Coal Co, Acosta No. 2	98⅛
7.	Consolidation Coal Co., Meyersdale No. 1	97⅝
7.	Consolidation Coal Co., Meyersdale No. 2	97⅝
8.	Quemahoning Coal Co., Ralphton	94⅝

Prizes were won as follows: One-man event, Ralphton team of Quemahoning Coal Co.; two- and three-man events, Meyersdale team No. 1 of the Consolidation Coal Co.; team event, first prize to Orenda No. 2 team of Somerset Smokeless Coal Co., of Boswell; second prize to Jerome No. 2 team of Jenner Quemahoning Coal Co. The first prize for the team contest was a silver cup, presented by the E. I. duPont de Nemours Powder Co., and the second prize was six sets of Seddon's Self-Help series of mining lessons. The American Red Cross secretary awarded certificates to the winners of the other events. The Y. M. C. A. presented bronze buttons to all of the contestants. The American Mine Safety Association awarded medals to the winning team. The judges, all of whom were doctors approved by the American Red Cross, were Dr. Edward Pardee, South Fork; Dr. S. J. H. Louther, Somerset; Dr. J. W. Hawes, Windber; Dr. Henry Hertzler, Jenners, and Dr. George F. Speicher, Rockwood.

Western Fuel Co.'s Rescue Corps

By J. W. Jemson*

The Western Fuel Co. is the holder of the silver cup and championship of Vancouver Island, Canada, for the years 1912 and 1913. The photographs show the personnel of the St. Johns Ambulance and mine-rescue teams for 1914. Three teams will represent the company at the St. John's Ambulance Demonstration to be held in Vancouver, Aug. 17, on which occasion the Duke and Duchess of Connaught will be present. The Duke, who is Governor-General of Canada, is an enthusiastic adherent of the Ambulance association and on his previous visit to Nanaimo, two years ago, commented most highly on an improvised stretcher made by the Western Fuel Co.'s men with articles found in the mines, consisting of three coats and long-handled shovels, such as are used for removing undercuttings after machines.

*Box 478, Nanaimo, B. C., Canada.

Bringing the Man and the Job Together

There are a number of coal companies in this country in need of men with special training to fill positions in and about the mines. Coal Age believes that it is the natural medium whereby competent mining men and companies needing the services of such men can be brought together. We are, therefore, encouraging coal companies to inform us of their needs so that we can put them in touch with experienced men, capable of rendering satisfactory service.

Here is part of a letter we received this morning, and which comes to us after the page in our paper containing "Want Advertisements" had been closed for this week's issue. The company in question is operating in West Virginia and writes as follows:

> The returns from advertisement you inserted for mine foreman were so satisfactory that we should like to have you print a similar advertisement, to secure for us a general electrician, or master mechanic, to have general charge of the repair work and inspection of machinery of our several mine equipments, machine-driven tipples and power houses. This man should have sufficient technical information to intelligently work after A. C. and D. C. current. The man must be a hustler, as this is not an office position in any sense. He should be familiar with mine haulage and equipment.

Any Coal Age readers who are interested in the above position will please send their application to Coal Age, addressing it P, 292. When applications are accompanied by letters of recommendation, the latter should always be copies of the originals and not the original letters themselves. For reasons that are obvious, the identity of the coal companies advertising for men will not be divulged. It is also impossible for us to guarantee that all applications will be acknowledged or answered. If there were only five or six applications for any particular job, there is no doubt but that the coal company desiring a man would extend to each applicant the courtesy of an acknowledgment, but where the applications number anywhere from 50 to 200, it is unreasonable to expect that every application will receive a personal reply.

Two Mine Rescue and St. Johns Ambulance Corps of the Western Fuel Co.

Discussion By Readers

Checkweighmen

I am pleased to say that the foreword, COAL AGE, July 11, p. 51, on the subject of checkweighmen, has been read with considerable interest in this section. All of the mines in this part of Kentucky are nonunion, and 90 per cent. of them will not operate without a checkweighman.

Although the state law of Kentucky provides for a checkweighman at mines, the act is not compulsory further than compelling the operator to permit the employment of a checkweighman by the miners, upon the request of a majority of their number.

I am glad to be able to indorse the views expressed in your foreword, that coal operators are not generally opposed to the employment by the miners of a checkweighman. As there stated, in reference to the large coal companies of Alabama following the strike of 1908, our company favors the employment of a checkweighman, and insists on the men electing a person to serve in that capacity.

W. L. Moss, V.-P. and G. M.,
Continental Coal Corporation.

Pineville, Ky.

Conservation of Surface Values in the Extraction of Coal

The discussion of the effect of the mine-run law, COAL AGE, Aug. 8, p. 239, incidentally draws attention to a most important consideration, which until recently has not received the recognition it demands. I refer to the adoption of means and methods in coal mining that will afford adequate support to the surface overlying the seams of mineral extracted.

The United States has reached a stage of development when the conservation of its natural resources has become absolutely necessary if it is to continue for any length of time as a producer for domestic and foreign consumption. As a result of the conservation methods already enforced, the coal-mining industry is conducted on more scientific and economic principles, both with respect to production and safety.

While economic extraction is an important factor in conservation, the operation of this factor is detrimental, in many instances, to the conservation and preservation of the resources of an industry as important, if not more so, to the welfare of a nation's prosperity as mining. Many of our large coal fields underlie sections that are valuable for their natural wealth of soil. By our present methods of extraction, such territory is rendered worthless or its productiveness is greatly depreciated.

Conservation, applied to mining, has limitations not characteristic of other natural resources. If land, favorable to agricultural pursuits, be denuded of its vegetation, we can conserve the forests by planting new growths in sections that are not so favorable for this industry, and, by so doing, increase the fertility of the soil by supplying it with a natural fertilizer that will, in time, make it as adaptable for agriculture as the former. Coal, being a product of a prehistoric age when climatic conditions were specially adapted to its formation, cannot be conserved in this way. Its renewal is impossible, as the conditions that produced it will never again exist here. It can be conserved only by economical extraction, and I consider that a method of extraction that will preserve the surface fertility is a subject that should demand the serious consideration of mining men and the attention of our state and national governments.

Millions of money have been spent in the reclamation of desert wastes; thousands of happy homes and millions of wealth have been added to our national prosperity by this noble work—and its results are cumulative. Our nation has attained great commercial prestige and wealth by the products of its coal-mining industry, yet this industry has rendered sterile thousands of acres of land in the centers of greatest population, whose productiveness would have been of greater value to the present and future generations than are now the more distant areas of reclamation.

The conservation of land surfaces for agricultural and allied industries will, in the near future, become a question of the most important consideration to this nation. If the present methods of extracting our coal be continued, with the interritorial increase of the industry, the amount of land rendered nonproductive will assume abnormal proportions. Some method should be devised by which the coal can be extracted and the land surface retain its fertility.

I consider this matter to be of sufficient importance to merit earnest discussion.

I. C. PARFITT.

Jerome, Penn.

The Mine Foreman

Letter No. 8—The recent discussion of the qualifications of the successful mine foreman and his relation to the mine superintendent, COAL AGE, May 30, p. 898, was of great interest to all superintendents and foremen. I desire to add to what has already been said, a few words bearing on the unwise interference of a superintendent with the authority of his foreman, in the mines.

One of the vital conditions, in respect to maintaining perfect discipline in a mine, is that the foreman's authority shall be clearly recognized, not only by the miners and the assistant foremen and bosses, but likewise by his superior officers. It is the beginning of serious trouble in the mine when the owner or superintendent calls in question the authority of the mine foreman and countermands his orders, disapproving of his methods and deranging his plans. The law in Pennsylvania compels the operator to employ a competent mine foreman, and gives to the mine foreman the full charge of the inside workings of the mine and the men employed in the underground operations.

While it is the unquestioned right of the superintendent to draw the attention of his foreman to any observed violations of the law or to any mismanagement of the men in his charge; and, further, to discuss with him questions of economy and safety, in respect to the methods employed in operating a mine, this should be done privately in the office and not in the presence of the men in the mine. Moreover, the superintendent should remember that the mine foreman's experience and qualifications *should* be such as to render him a capable judge of the methods he employs; and, if he is to be held accountable for results, he should be permitted to pursue his own plans for their attainment. If these plans prove the foreman incapable, arrange a suitable division of the work or get another foreman.

Every true foreman will welcome suggestions from his superintendent, in reference to the improvement of the means and methods he employs; but too often it happens that the mine foreman does not exercise his best judgment, in matters in his jurisdiction, because of the fear of interference on the part of a superintendent who is his superior. While it may be true that a superintendent who is expert in mining methods may be able to dictate and criticize the work of his foreman, he should avoid the mistake of humiliating him in the mine, which cannot but prove mischievous. A wise superintendent, however capable, will always avoid allowing his authority to come between the mine foreman and the men employed in the mine. By so doing, he can supplement the foreman's ability with his own judgment and skill, whereas, the attempt of a superintendent to prescribe the methods of mining and control of the men, enforcing his dictation by personal oversight in the mine, will be acting in a manner subversive of mine discipline.

The attitude of the superintendent, in the mine, should be one of respect for the mine foreman's efforts and recognition of his authority in respect to the work in his charge. Anything else develops in the foreman a wise hesitancy to exercise a doubtful and disputed authority, which results at once in a lack of discipline. The same result is plainly evident in the case of foremen who are not well informed in regard to their authority and duty as prescribed, in most cases, by law or conferred upon them when they accept the office.

One of the strongest factors in mine discipline is the confidence that the men impose in the mine officials, as being qualified for the positions they hold. A lack of confidence discredits the official in the minds of his men. Such confidence can only be gained by the evident fitness of the foreman to conduct the work in his charge. For this reason, the selection of a mine foreman should be guided by the question of his fitness and merit alone. No personal, political or social influences should be allowed to control the selection of a man for this position. He must possess a personal magnetism or a *personality* that will make him an efficient disciplinarian, able to maintain his authority in the mine. Aside from this, he must possess a thorough knowledge of mining and familiarity with underground work and equipment. These characteristics in the man will lessen the danger of interference or outside control of matters that are within his natural jurisdiction.

It has been stated that many foremen and others, having passed a successful examination and having received a certificate of competency, have thought it was no longer necessary to read or study mining questions. As a fact, men who are the most capable are constant students of the conditions relating to their work. Doctor Arnold, of Rugby, when asked why he spent several hours daily in preparation of lessons he had taught for years, replied: "I wish my pupils to drink from a running stream and not a stagnant pool."

In the maintenance of discipline, more depends on the *certainty* of punishment, than on its *severity*. Experience has shown that *the uncertain enforcement of mining laws and regulations has operated largely to increase the dangers of mining*. A discarded or obsolete law often proves a menace rather than the safeguard it was intended. Discipline requires that a law enacted must be obeyed, and any violation must bring punishment, in proportion to the offense committed. Insubordination or disobedience to authority may not be tolerated with impunity.

A violation of law or mine regulations may merit the suspension or discharge of the guilty party; but, in no case, should a personal indignity be inflicted, such as styling the man a "dumb Dago" or a "dumb hunky," which appellations only give rise to resentment. Ridicule and sarcasm are not the weapons a mine foreman should use if he is to retain the respect of his men. There may be rare instances when a slight sarcasm or ridicule is necessary to take the natural conceit out of a man, but good judgment must be exercised at such times to avoid making an enemy of such a one.

LEHMAN G. HANGER, Asst. Mine Foreman,
Carbon Mine, Keystone Coal & Coke Co.
Greensburg, Penn.

Co-operation in the Mine

Letter No. 2—I read with much interest the remarks of Frank S. Davis, in reference to securing coöperation in the mine, COAL AGE, July 25, p. 155. Instituting weekly meetings of the mine foremen for the purpose of discussing and studying mine problems of safety and other matters of interest in mining, is a long step in the right direction; and Mr. Davis is to be commended for his efforts in this regard. If properly conducted and maintained, the plan will prove a fruitful means of training and educating all employees.

While I am in full accord with the idea expressed in the editorial item, COAL AGE, Apr. 18, p. 654, like Mr. Davis, I would eliminate the word "compulsory" and make the meetings optional, at least until such plan failed and it was found necessary to adopt more stringent measures in order to secure a full and regular attendance.

If more superintendents would follow the example of Mr. Davis, by instituting similar meetings, and insist upon the foremen urging the young men employed in and about the mines to attend such meetings, and endeavor to interest them in the study and discussion of the many perplexing problems pertaining to mining, the result would be the development of more efficient workmen; and a larger number of trained men would then be available and ready to assume the responsibilities of mine foremen.

During the three years that I have been connected with the examining board for the examination of candidates for mine foremanship, I have observed that those

applicants, coming from mines where officials have lent their assistance for the education of their men, have made higher grades than candidates coming from mines where no such assistance was available.

In my opinion, it would be a good investment for mine superintendents and mine foremen of large mines or groups of smaller mines, to establish schools of training for their young men. Many of the men now employed as miners possess more than ordinary intelligence and abilities of which they are scarcely aware. If these elements were properly cultivated and trained, the result would be to increase the efficiency in the operation of the mine. On the other hand, the neglect of such education and training produces a class of indifferent workers, having little ambition to rise above the plane of the common miner.

It is unfortunate that, in many cases, the mine superintendent assumes an attitude of superiority and holds himself at too great a distance from his men. In such cases, the miners come to feel that all the interest the superintendent has in them is their producing power, or the number of tons of cheap coal they can mine daily. While this is true in many instances, I am glad to say that it is not the case at all mines. Many superintendents now realize that the better trained and the better informed miners become, the better prepared they are and the more willing they seem to assist and coöperate with the officials in the operation of the mine.

The average coal miner knows little of the many perplexing problems with which superintendents and foremen have to contend daily. They are apt to think that all the boss has to do is to superintend the work and they regard him as having an "easy time." A weekly conference of the mine officials and the men, for the purpose of studying and discussing many of these problems in which they are equally concerned, could not fail to be of benefit to the operator and would unquestionably result in the greater safety and the betterment of the condition of the miners as well. The result would be that both miners and officials would be drawn closer together and would come to feel that their interests were mutual.

In closing, I cannot refrain from expressing the hope that many superintendents will adopt the methods pursued by Mr. Davis, in the informal organization of their men, for weekly conference, study and discussion. It is my belief that the time so spent would not be wasted; but that the officials in charge would be amply rewarded by the rapid increase in the efficiency of every mine worker.

JOHN ROSE,
District Mine Inspector.

Dayton, Tenn.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

MEASUREMENT

The valuation and comparison of the various forms and conditions of matter and the estimation of physical phenomena are made by reference to three general standards of measurement, namely, **distance, force** and **time.** There are many modifications and combinations of these three elemental standards.

Distance—This includes the measurement of length, surface and volume, all of which are derived from the same standard of measure.

Force—All measurement of force is based on the attractive force exerted by the earth on an assumed **unit of mass** at the surface (sea level), in any given latitude. Mass thus becomes the true unit in this measurement; but being intangible, the adopted unit is the **pound,** which represents a certain definite mass, taken as the "unit of mass," for purposes of measurement. A force is measured by the effect of its action on a known mass. There are two conditions:

1. **Static** condition (mass fixed, immovable) = pressure, weight.
2. **Dynamic** condition (mass free to move) = motion, velocity.

Under these two conditions, there are, therefore, two units of force. The unit of measure for **dynamic forces** is the force that will produce a unit of velocity in a unit of mass, in a unit of time. In other words, the force that will increase the rate of motion of a unit mass, by a unit distance, in a unit time.

Time—The element of time is important in the estimation of velocity and power. For example, to traverse the same distance in one-half the time will require twice the velocity. Likewise, to perform the same work in one-half the time will require twice the power.

Special Units—There are numerous other units of limited significance; such as units of capacity, pints, quarts, gallons, barrels, etc.; units of currency, cents, dimes, dollars, etc.; circular units, degrees, radians, etc.; electrical units, amperes, volts, ohms, watts, etc.

Compound Units—Many units of measure are composed of two or more simple units. The following are examples:

Unit velocity—(distance) ÷ (time)..Ft. per sec., or ft. per min.
Unit work—(distance) × (force).....Ft.-lb.
Unit power—(distance) × (force) ÷ (time)...Ft.-lb. per min.

The above are only given as samples of many similar compound units; such as inch-pounds; miles per hour; gallons per hour; cubic feet per minute; pounds per cubic foot; tons per acre; foot-acres, etc.

All of these, it will appear, are derived from the simple units of distance, force, time, or the special units to which reference has been made.

Application—Applying these units of measure, the weight

$$F = W \qquad (1)$$

(W) of a body, expressed in pounds, is the static force (F) acting on the body, due to gravity. Hence, in statics,

The Coal Age Pocket Book

In dynamics, the force (F_1) producing motion is measured by the mass (M) of the body and the velocity (v) produced per unit of time. Hence, in dynamics,

$$F_1 = Mv \qquad (2)$$

Assuming a falling body, the force producing motion is the weight (W) of the body, and the gain in velocity per unit of time (acceleration due to gravity, **g**) is the velocity produced in the mass (M). Hence, in falling bodies,

$$W = Mg \qquad (3)$$

and

$$M = \frac{W}{g} \qquad (4)$$

which enables the calculation of the mass of a body from its weight.

Combining formulas (2) and (3),

$$\frac{F_1}{W} = \frac{v}{g} \qquad (5)$$

Hence a force acting to produce motion in a body bears the same ratio to the weight of the body, as the acceleration due to the force bears to the acceleration due to gravity. Or, expressed as a proportion,

$$F_1 : W :: v : g$$

Energy—Energy, in physics, is **capacity to perform work.** It is the vitalizing force that is manifested in matter by the familiar agencies of heat, light, electricity, magnetism, molecular attracton, chemical affinity, etc., all of which are equally convertible, one into the other, without loss.

The physical agencies or forms of energy just mentioned are each and all convertible into mechanical motion, which, again, can be reconverted into heat, light, electricity and magnetism. This fact gives rise to what is called the **"mechanical equivalent"** in reference to heat.

Forms of Energy—Energy is of two kinds that differ from each other only in the sense that one (kinetic) is actual and present, while the other (potential) is possible only.

Kinetic energy (E) is the energy possessed by a body by virtue of its motion. The force producing an acceleration (f) in a mass (M), or the "living force" in the body **(momentum),** is **Mf.** The acceleration (f) being uniform or the velocity increasing uniformly, the distance increase, per unit of time is **f/2,** and the work performed in producing this acceleration is stored in the body as "kinetic energy," by virtue of which the body would continue to move at the velocity imparted, till restrained by an opposing force. The stored energy is

Kinetic energy, $E = Mf \times \frac{f}{2} = \frac{1}{2} Mf^2$

Potential energy is the energy that is possessed by a body by virtue of the position or state in which it is held or restrained, so that motion cannot take place till the restraining force is removed. Examples of bodies having potential energy are, a suspended ball, a confined spring, etc.

Inquiries of General Interest

Permissible Electric Mine Lamps, Schedule No. 6

I want to ask why should the Bureau of Mines issue a new schedule on portable electric lamps, in which they advise and suggest certain mechanical changes to meet the ideas of the engineers in the Bureau of Mines. Many of the suggested changes have nothing whatever to do with the safety features of the lamp, and it is difficult to understand why such details of construction should be mentioned in reference to the tests that lamps must undergo, at the government station.

It is up to the Bureau of Mines to test all lamps submitted to them, to determine their *safety* and not to recommend, for use in mines any lamp that their test shows would be unsafe. It is not up to the Bureau of Mines to suggest and much less to insist on certain methods of construction, or certain requirements regarding the life of the lamp bulbs or the size and shape of the reflectors. These matters belong entirely to the various manufacturers of portable lamps, who should be free to produce their own ideas and submit the same to the Bureau of Mines for test. The Bureau, in turn, should test these lamps for safety.

When the Bureau of Mines interferes with the progress of the manufacturers of electric lamps, they place the industry in jeopardy, due to the fact that manufacturers will, at no time, be able to standardize their outfit; and operators, in turn, will hesitate about placing orders for lamps, when the type of construction may be changed at any moment. It would be a hardship for a manufacturer to be compelled frequently to change the construction of his lamps to make them conform to the whims of the bureau engineers, except as required for safety. Such changes would compel him to keep on manufacturing supply parts for all the outfits which are at present being used, and would certainly cause much confusion and annoyance for operators.

We realize that we are living in a world where one competes with another and each is endeavoring to turn out a better outfit than another. For this reason, if for no other, it is entirely up to the manufacturers of lamps to build their outfits in the best possible manner, and it is natural to suppose that the best manufactured lamps will be installed to the greatest extent.

After consulting with several coal operators who have installed electric lamps and after talking over the matter with some manufacturers of lamps, I find they are all of the same opinion and feel that the U. S. Bureau of Mines should not interfere in the manner of construction of lamps, in any respect except as regards the *safety* of the battery and the lamp.

A Coal Age Reader.

——, Penn.

Correspondent has stated his complaint in a clear and practical manner as viewed from the standpoint of both users and manufacturers of portable electric lamps. The arguments presented are logical and call for a definite statement from the Bureau of Mines, defining their purpose in the matter of testing such lamps; and explaining the requirements outlined in the new Schedule No. 6, to which exception is taken.

It is possible that the suggested changes would render the work of testing these lamps more certain and less laborious and expensive to the government. Certainly, the bureau would have no right to ask or require changes in style or construction of lamps, other than are necessary to permit of a uniform method of testing and to insure safety for use in the mine.

The readers of Coal Age will be glad to hear from the U. S. Bureau of Mines in reference to this matter, which is recognized, at once, as being of vital importance to all users of electric mine lamps, as well as to manufacturers of the same.

Blasting in Mines Where Electricity is in Use

Having recently installed electricity in our mine, for purposes of power and lighting, I desire to ask, if the dangers due to blasting are increased thereby and, if so, in what way does the installation increase this danger?

Superintendent.

————, Wyo.

The answer to this question will naturally be confined to the dangers due to blasting as being increased by the use of electricity for power and lighting, and does not include other dangers arising from the use of electricity in the mine, such as the ignition of gas by the short-circuiting of the current or the sparking of the wires; or the danger of shock or death to men or animals from contact with live wires, although such dangers are more common than those incident to blasting.

The principal danger from electrical blasting in coal mining is that arising from a premature blast, owing to an accidental closing of the circuit by the operation of a switch by an unauthorized person or by the short-circuiting of wires. To avoid this danger the feed wires leading to the face of the coal should not be laid, except by the miner in charge of preparing the shot and when all is in readiness for the blast, the men in adjoining places having first been notified. Where a blasting machine is used, this should be under the constant supervision of the miner who prepares and fires the shot.

The use of electricity in mines, for power purposes, may offer a temptation to the miner to tap the power current for the purpose of firing a blast in his place. There should be strict regulations in order to avoid this possibility and danger. It should also be remembered that where wires are installed in a mine, for the purpose of firing shots, the danger of lightning striking the wires and causing a premature blast should be safeguarded by disconnecting the wires at a safe distance from the working face.

Examination Questions

Questions for Examination of Mine Electricians

(*Continued from last issue*)

Ques. 13—If it should happen that the two coils were bucking each other, how would you locate the trouble in a compound motor?

Ans.—Disconnect the shunt field temporarily and test the series field with a compass, to determine the direction in which the current is circulating in the series field. Again, connect the shunt field and remove one of the brushes so as to break the current in the series field. Then, test the current in the shunt field, in the same manner, to determine the direction in which that current is circulating. The information so gained will make it possible to locate and remedy the trouble.

Ques. 14—Why is the core of an armature always laminated?

Ans.—The purpose of the laminations in the core of an armature is to prevent the generation of eddy currents, which would cause the armature to heat at those points.

Ques. 15—What is the difference, if any, between brass and bronze?

Ans.—Brass is an alloy of copper and zinc, while bronze is an alloy of copper, zinc and tin.

Ques. 16—Why are wormwheels generally made of bronze?

Ans.—The sliding motion of the worm on the teeth of the wheel produces less friction when the wormwheel is made of bronze, because bronze and steel run better together than steel and steel. Cast iron is the only metal that runs well on itself. The sliding motion of the worm on the teeth of the gear makes it more important to observe this fact in a worm-gear drive.

Ques. 17—When drilling brass, would you use the same drill as when drilling steel or iron?

Ans.—No. When drilling brass, the lip of the drill should be ground off sufficiently so that the cutting edge of the tool will be normal to the surface drilled. Otherwise, the lip of the drill will tend to dig into the brass, and the tool will be broken. With a normal cutting edge the brass is scraped, rather than cut, from the body of the metal.

Ques. 18—Would you turn a commutator with a lipped tool?

Ans.—No. A lipped tool would tend to dig into the copper and streak the surface of the commutator, which should be smooth so as to yield a uniform contact of the brushes. To prevent this, the cutting edge of the tool should be normal to the surface, so as to produce a scraping effect instead of cutting into the metal.

Ques. 19—Can brass be melted in a ladle?

Ans.—The brass will melt with difficulty unless broken into small pieces. It is better to use a crucible.

Ques. 20—What is german silver?

Ans.—German silver is an alloy of copper, zinc and nickel, the composition being quite variable, depending on the purpose for which it is intended, and the price to be paid for same.

Ques. 21—Under what condition is glass a conductor of electricity?

Ans.—Glass in the molten state becomes a conductor of electricity.

Ques. 22—In the use of carbon brushes on a generator or motor, what is a "pig-tail" and what purpose does it serve?

Ans.—A "pig-tail" is a short-wire connection between the carbon brush and the commutator ring, which makes unnecessary the passing of the current through the brush holder and avoids any difficulties that might arise from the heating of the holder.

Ques. 23—Where is the neutral point on a motor?

Ans.—The neutral point of the motor is the point where the coils that are short-circuited by the brushes are exactly midway between the pole pieces.

Ques. 24—Why are the brushes set back of the neutral point on a motor?

Ans.—The coils must be short-circuited in a field that will generate in them a current that is traveling in the same direction as the current they will receive when they leave the brush.

Ques. 25—Is it well to undercut the mica on commutators?

Ans.—Yes, if the motor runs fast enough to keep the slot free from carbon and copper dust.

Ques. 26—Is carbon a good conductor?

Ans.—Carbon is a poor conductor in comparison with the metals.

Ques. 27—What is a "feather," a feather-key or spline, and what is its purpose?

Ans.—A "feather" or feather-key is a key set into a shaft that is to carry a camwheel, pulley or other rotating part. The wheel or pulley is either forced or allowed to slide endwise over the feather, which fits snugly into the keyway, so that it is immovable. The purpose of the key is to prevent the wheel or pulley from turning on the shaft.

Ques. 28—Is a spring-lock washer left- or right-handed, or does it make any difference?

Ans.—The spring-lock washer must correspond to the nut used and is commonly right-handed, otherwise the nut could not be tightened up and the washer would be ineffectual for locking the nut.

Ques. 29—What is residual magnetism?

Ans.—The magnetism remaining in the pole after the current is shut off is called "residual magnetism." The residual magnetism plays an important part in the starting of the generator.

Ques. 35—Will a motor start light with no field current?

Ans.—Yes. The residual magnetism of the poles will enable the motor to start, under no load, with some sparking at the brushes, however.

Coal and Coke News

Washington, D. C.

Government officers are expecting that as a result of the European war, there will be a material increase in the demand for American coal of various kinds. According to officers of the Department of Commerce, the chief obstacle to the immediate development of this demand is found simply in the disturbed shipping situation. However, as soon as that condition is rendered more normal, and as soon as there is a steady supply of tonnage it is believed that a heavy export movement of coal will set in.

As a matter of fact the prevalent belief, based on advices to the government from many different sources is that at least a moderate amount of transportation will be provided within a reasonably short time. The advices received here are to the effect that the British Admiralty regard the German fleet as bottled up for the present and so long as it continues in its present situation, apparently unwilling to risk a general engagement it will be possible to keep the North Atlantic routes open while some other routes such as those to South America and elsewhere are expected to be safe from now on.

Of course, this condition would be changed abruptly, according to the opinion of public officers, should an engagement occur resulting in a serious defeat to the British ships. German vessels would then have control of the situation and presumably they would render the ocean unsafe for British and American vessels, if the latter were carrying goods of a contraband nature.

Supposing that the existing conditions are maintained, it is believed that the demand for coal will be strengthened in several distinct ways. In the first place, exports of coal from Continental countries will not be possible and those who have been depending on these supplies will naturally look to England and the United States. The disturbed conditions of production in England will be likely to throw the trade to the United States provided that oversea transportation can be furnished at a reasonable rate, as it is supposed will be the case, if a considerable amount of tonnage is restored to the ocean in the way that has been indicated.

Secondly there is every reason to believe that a good deal of shipping will be diverted from the Suez Canal route to Panama, thereby necessitating the provision of large quantities of coal on the Isthmus in order to enable passing vessels to provide themselves with fuel, it being well recognized that the possibility of coaling there cheaply is one of the essentials to the development of the Canal trade.

Thirdly, a decided increase in the amount of the trade with South American countries is looked for, in case the European war continues for some time to come, those countries being obliged to turn to the United States for many articles they have heretofore obtained in Europe. The result will be a stimulus to the amount of shipping plying between the United States and South America and a consequent increase in the amount of coal required to supply its needs.

Finally the probable demand for coal domestically consumed in carrying on industrial operations will, it is believed, be rendered greater by reason of the prevalence of hostilities abroad. A good deal of study has been given to this situation by various government bureaus and the expectations that seem to prevail are as just indicated.

A Study of the Rate Decision

Further study of the 5 per cent. rate decision of the Interstate Commerce Commission is developing some decidedly interesting data with regard to the bearing of the decision upon the coal industry and the position of the coal roads. The complete text of the decision is now available and contains considerable matter bearing directly on this subject. One point of considerable interest made by the Commission is that on the coal roads the cost of operation has been greatly reduced. The Commission says:

But even if the evidence clearly established an increase in the general freight operating expense ratio, we should not be at liberty on this record to conclude that the cost of transporting each kind of freight had increased much less than it had increased proportionately. The evidence is clear that as to certain classes of bulk or heavy freight, like coal, coke, ore, cement, brick, tile, clay and plaster, the use of larger cars must have reduced operating costs, whereas in respect to expedited package freight, shipped in cars moving on a regular schedule, regardless of the quantity of their contents, the use of larger cars, involving greater unused car capacity, must have increased the operating costs. Similarly the extension of the expedited service in carload freight must have increased the cost, while the heavier train loading of the slow train, in which the heavy or bulk freight usually moves, has tended to decrease the cost.

Eight systems in official classification territory, each of which shows for 1913 an operating ratio of less than 66⅔ per cent., are known as coal or ore carrying roads; namely, the anthracite coal carriers, the Central of New Jersey, Delaware & Hudson, Delaware, Lackawanna & Western, and the Reading, and the bituminous coal and ore carriers, the Hocking Valley, Kanawha & Michigan, Norfolk & Western and Bessemer & Lake Erie.

The tonnage of each of these roads consists in large part of the products of mines, and all of them are very prosperous. Each of the bituminous roads has an exceptionally low yield per ton mile for all traffic, and yet the representative yield per ton for carrying bituminous coal is lower, and on most of these lines much lower, than their average per ton mile revenue.

The Commission goes on to demonstrate this fact by citing figures for the traffic and returns of the bituminous coal roads showing that the percentage of the tonnage of the products of mines to the total tonnage is 79.78 per cent. in the case of the Hocking Valley R.R., 82.60 per cent. in that of the Kanawha & Michigan, 76.05 per cent. in that of the Norfolk & Western and 87.95 per cent. in that of the Bessemer & Lake Erie R.R. The representative bituminous coal net yield per ton per mile in the case of these roads is respectively 2.56 mills, 3.03, 2.88 and 4.50 mills. A comparison of the operating results of the New York Central R.R. and the Pennsylvania R. R. with the leading coal carrying subsidiary of each tends to the same general conclusion.

No Discrimination against Bowling Green

The Interstate Commerce Commission has just handed down an important decision in the case of the Bowling Green Business Men's Protective Assn. vs. the Louisville & Nashville Ry. in a case involving among other things a considerable tonnage of coal.

In this case it is held that the construction of through rates from Chicago and Milwaukee territories to Nashville, Tenn., by the addition of proportional rates from points of origin to the Ohio River to the local rates from the river to Nashville, contrasted with the construction of rates to Bowling Green by the addition of the local rates to and from the river crossings does not result in undue discrimination. The construction of through rates from Indianapolis territory to Louisville in a similar way is, however, found to constitute undue discrimination against intermediate points.

HARRISBURG, PENN.

No railroad or other carrier of coal may transport this commodity in cars owned by the producer at a lower rate than is charged for carrying the same commodity in cars not so owned. This decision was made on Aug. 7 by the Public Service Commission in disposing of a complaint that interested the entire bituminous region of the state.

The gist of the commission's decision is that to permit a lower rate to be charged when coal is carried in the producers' cars will open the way to actual discrimination in favor of certain customers because the producing company could thus sell coal to such customers for less than would be charged those who got coal on which the full freight rate was charged.

The Pennsylvania R.R. Co. is the respondent in the case, the complainants being the Pennsylvania Rubber Co., the Westmoreland Specialty Co., the Pittsburgh Lamp, Brass & Glass Co., the McKee Glass Co. and the American Window Glass Co. The complaint involved rates on coal from Penn, Biddle, Irwin, Hahnton, Jeannette and Grapeville.

New rates were put into effect by the Pennsylvania R.R. June 1, and most of them were declared to be reasonable, but it is ordered that the rate from Biddle to Grapeville be reduced from 25c. to 20c. a ton, the same as the rate to Jeannette, and that from Hahnton to Jeannette be reduced from 30c. to 25c. The 15c. rate from Penn to Jeannette and Grapeville and the 20c. rate from Biddle to Jeannette are held to be reasonable.

Notice has also been served by the commission that it has reason to believe that considerable disregard, deliberate or otherwise, exists of the provisions of the public service company law requiring all companies subject to the jurisdiction

of the commission to publish, post and file tariffs of charges which they assess and collect.

The commission added that it purposes to institute a vigorous inquiry into the matter and to compel delinquents to comply with the act of 1913.

Foreign Nations Buy Coal

Orders for coal aggregating more than 1,000,000 tons have been placed with dealers throughout the state during the last few days (up to Aug. 8) by business agents representing the governments of France, Italy, Germany, Austria and Russia. So strong is the demand, it is said, that practically any reasonable price is given, provided the dealers will promise to begin loading for shipment within 10 days.

Italy has taken 400,000 tons and has options on an additional 150,000 tons for future delivery. The supply is holding out well because of the withdrawal of so many steamships from active trade, and no shortage is anticipated.

In booking the orders, the exporters are facing the problem of finding vessels in which to deliver the product. Exporters believe that Germany and Austria will be forced to buy practically all of their coal in this country. In the past they have depended largely on the Welsh product. The Welsh fields will be unable to meet the demands now made upon them by England, France, Russia and Italy, and the overflow will naturally divert to this country.

PENNSYLVANIA

Anthracite

Scranton—The city controller has been compelled to hold up the bills of three mining experts, because of the lack of funds in the appropriation granted for the continuance of the mine-cave test case against the Scranton Coal Co., on which the engineers were employed.

Yorktown—The Beaver Brook colliery of C. M. Dodson & Co., which is in charge of General Superintendent John Turnbach, broke all previous records during the month of July, when over 40,000 tons of coal were prepared and shipped to market. This is a very creditable showing and is worthy of notice by reason of the fact that at this time of the year most of the other collieries are working half time.

Shenandoah—Shenandoah City and Indian Ridge collieries of the Philadelphia & Reading Coal & Iron Co. were ordered to suspend all operations on Aug. 8, indefinitely, to make general repairs, throwing 2500 men and boys out of employment.

Bituminous

Uniontown—Foreclosure proceedings have been started in the Fayette County court on an $8,000,000 mortgage held by the Colonial Trust Co. of Pittsburgh, as trustee, against the Isabella-Connellsville Coke Co. The mortgage was given Apr. 1, 1909, payable in 30 years, with interest at 5 per cent. The trust company held $8,000,000 in bonds, covering 2967 acres of 9 ft. river-vein coal in Luzerne township. It maintains the coke company defaulted in paying interest on $6,515,000 still due, and the foreclosure is for that amount and interest.

Indiana—The purchase of the holdings of the Penn-Mary Coal Co. in Indiana County by the Cambria Steel Co., of Johnstown, is reported. The operation includes nearly 25,000 acres of coal and modern plants and the mining town of Heilwood. Vice-President Slick, of the Cambria Steel Co., is in temporary charge.

Johnstown—The nine mines of the Pennsylvania Coal & Coke Corporation in Cambria County were closed indefinitely, it was stated on Aug. 4, owing to the slump in orders due to the holding up of transatlantic liners by the war. The mines of the company in this vicinity make a specialty of furnishing coal for the Atlantic liners. The mines at Beaverdale are already closed down, and it is said others will follow.

Portage—A notice was posted on Aug. 5, by the Millar Shaft Coal Co., warning all employees to remove their tools from the mine before Aug. 8, as the mine would be closed after that date. The notice is taken to mean that the workings will be closed indefinitely, owing to the rejection by the men of the company's plan to keep the shaft working pending the arbitration of the question of a checkweighman.

Dunbar—The miners employed by the Mahoning Coal & Coke Co. have struck and the mine is idle pending adjustment of the trouble. The miners say that the wagons hold 47½ bu. of coal, while they are only being paid for 40 bu. It is alleged that an employee of the company was discharged for not putting the "hump" on a wagon. Orders were issued to the effect that anyone falling short would be discharged. This was the real cause of the strike, and the miners declare they will not go back to work until they are paid for the full amount of the coal they mine.

Fayette City — The Apollo mine of the Monongahela River Consolidated Coal & Coke Co., has resumed operations after a suspension of several weeks. Approximately 300 men are employed at this operation.

Dunbar—The fire in the Atlas mine of the Cambria Steel Co., was extinguished on Aug. 3, two hours after helmet men from the Davidson and Leisenring No. 1 plants of the H. C. Frick Coke Co., a force from Johnstown, and others, had turned a hose on the blaze. Within three hours after smoke was discovered on Aug. 2, helmet men from the two Frick plants had penetrated 750 ft. into the mine and discovered the fire. How this fire started is unknown, but the damage inflicted was slight.

Connellsville—It is reported that the H. C. Frick Coke Co. has blown in nearly 400 additional ovens, and more than 200 independent ovens at the same time were blown out. As a consequence the production of coke is approximately 270,000 tons per week at the present time.

WEST VIRGINIA

Huntington—On Aug. 3, all coal loading records for one day were broken on the Chesapeake & Ohio R.R. About 110,000 tons of coal were handled by the road, this being an increase of 10,000 tons over the amount handled on any previous day in the history of the road. Officials of the company are, however, predicting that this record will be broken again during the current month.

Eccles—The coal mines of the New River Collieries Co. at this point, which were wrecked by an explosion on Apr. 28 with heavy loss of life, have been repaired, and it is said that operations will be resumed shortly. The intention now is to make the Eccles Mine the safest and best in the country.

Bluefield—It was thought when war was declared in Europe, that the Norfolk & Western R.R. would be called upon to handle large quantities of coal to Norfolk to load on ships for Europe. Up to the present time, however, instead of the coal tonnage having been increased it has fallen off. This is due to the fact that few ships are now calling at Norfolk or Hampton Roads for cargoes of coal.

ALABAMA

Birmingham—Coal operators in the Birmingham district are anxiously awaiting instructions from Washington relieving the situation at Pensacola, Mobile and New Orleans as to loading bunker and other coals on ships touching at those points. When these matters are settled, no less than 1,250,000 tons will be shipped down as fast as transportation arrangements can be made.

KENTUCKY

Pineville—The main offices of the Continental Coal Corporation, which have been located here since the organization of the company, are being moved to Straight Creek. It was desired to have the offices nearer the actual workings.

Greenville—The Greenville Coal Co. bought the Browder mine and equipment of the Caldwell Coal Co. and New York parties paid $5000 for the Peanut mine of the same company when the property was sold at auction recently. The price paid for the Browder mine was $75,000. The Greenville company about four years ago sold the Browder mine to the Caldwell company for $250,000. Soon afterward the Browder mine disaster occurred, and the tipple and machinery were destroyed. It is not announced whether the Greenville company will operate the property.

Pikeville—The Elkhorn field has been quiet of late, owing to something of a stringency in the coal market, and, though all the mines in this district have been working, they are on part time. Immediate resumption of full-time operations is said to be in prospect.

OHIO

Shadyside—With no prospect in sight as yet for an agreement between the miners and operators of the Belmont County coal districts, one of the largest mines has been closed down and will not open again for at least one year, while it is thought that several others will follow. On Aug. 7, the Fort Pitt mine was ordered completely shut down as soon as possible.

Columbus—The Franklin County Court of Appeals has upheld the ruling of the Ohio Utilities Commission made two years ago in reducing the freight rate on coal from Nelsonville to Toledo from $1 to 85c. per ton. At the time the decision was given by the commission upon the complaint

of the New York Coal Co., the case was appealed to the state courts. It is likely the case will be carried up to the Ohio Supreme Court.

ILLINOIS

Marion—Reports from several of the mines in the Williamson and Franklin County field, particularly at Johnston City, Herrin, Bush, Christopher, Benton, West Frankfort and a few of the smaller mining towns, are that large numbers of foreigners are preparing to quit work to go back to their respective countries now engaged in war, in answer to the call for reserves. This movement will afford considerable relief to the United Mine Workers, inasmuch as there are more men now in the southern Illinois field than there is work for, and the retiring of a few thousand would improve conditions wonderfully.

East St. Louis—Due to a strike in the Kansas field, coal is now being shipped from Illinois to the manufacturing cities of southeastern Kansas, while miners in the adjoining districts are idle. Railroads now have the wheat crop to move and find it difficult to keep these districts in coal, and in spite of the shipments from Illinois, have lost traffic.

Livingston—The Livingston mine of the Rutledge & Taylor Coal Co., on the Big Four R.R., recently broke all previous records of production when 4670 tons of coal were loaded in 8 hr. This is equivalent to a train of 117 forty-ton cars.

ARKANSAS

Fort Smith—A suit for $220,000 damages was filed in the United States court here Aug. 4, by Thomas Smith, a miner, against the Central Coal and Coke Co. Smith was employed in the company's mines near Hartford. On Apr. 18, 1913, he was injured by the collapse of a roof in a passageway, while he was fighting a fire. He alleges negligence on the part of the company and asks damages for injuries, for loss of future earning power, for the humiliation of his present physical condition and for the punishment because of the alleged carelessness.

The federal court here on Aug. 3 ordered the reopening of the charge of contempt of court against Peter R. Stewart, of McAlester, Okla., head of the United Mine Workers of Texas, Oklahoma and Arkansas, who was tried for violating an injunction against violence prior to the riots that resulted in the destruction of the Bache-Denman Coal Co.'s mines at Prairie Creek.

FOREIGN NEWS

Dunfermline, Scotland—Work in the coal mines in the counties of Fife, Kenross and Clackmannan, the output of which is ordinarily shipped to Continental Europe, has virtually stopped. Supplies of raw materials in the factories are also almost exhausted, and in a short time operatives as well as miners will be out of employment.

PERSONALS

Douglass Vass, for 19 years demurrage agent of the Pennsylvania R.R. at Wheeling, W. Va., recently resigned from the service of the company. He has accepted a position as sales agent of the Beech Flats Coal Co.

H. W. DePue, of Spencer, W. Va., recently closed a deal with the Muddy Valley Mining Co., by which he and others associated with him become the owners of 6000 acres of coal land under full development in southern Illinois.

F. X. Quinn, of Philadelphia, representing the bondholders, recently, bid in at $1,000,000 the Oklahoma Central R.R., running from Purcell to Lehigh in the coal fields. It is understood that the Santa Fé may lease or buy the road to secure an entrance to the coal district.

Joseph J. Walsh, state mine inspector of the 10th District of Pennsylvania is preparing a set of three text books for the help of young men engaged in mining. They are designed especially for the use of night mining schools such as have been established in various communities of the anthracite region.

OBITUARY

David Lynch, aged 66 years, formerly a coal operator at Evansville, Ind., also well known in western Kentucky, died recently at his home in Evansville. He is survived by four sons and four daughters.

William Torance, superintendent of the mine at Willock, Penn., died at the Mercy Hospital, Pittsburgh, Aug. 5, at the age of 68 years, as a result of being struck by a train. Mr. Torance was born in Scotland and came to Willock 23 years ago. He leaves four sons and two daughters.

A. P. Trautwein, organizer and former president of the Carbondale Machine Co., died Aug. 4 in his home on Lincoln Ave., Carbondale. He had been suffering from a complication of diseases for about a year, but heart trouble was given as the immediate cause of death.

Born in New York in 1857, Mr. Trautwein came to Carbondale in 1889. In 1896 he organized the Carbondale Machine Co., which has had a consistent and successful career. In addition to this concern he had been connected in an official capacity with the Los Angeles Ice & Cold Storage Co., the Spencer Heater Co., the American Acid & Alkali Co. and the Buffalo Cold Storage Co. He was an authority on the manufacture of coal illuminating gas.

Mr. Trautwein was a member of the American Society of Mechanical Engineers, the Engineers' Club of New York, the Manufacturers' Club of Philadelphia, the Engineers' Club of Scranton, and the Drug Trade Club of New York, and the Delta Tau Delta fraternity. He is survived by a wife, four daughters, three brothers and two sisters.

RECENT COAL AND COKE PATENTS

Coke Oven. F. W. Sherr, Jr., Chicago, Ill. 1,097,196. May 19, 1914. Filed Jan. 31, 1914. Serial No. 815,763.

Gas Producer. J. F. Guggolz, Teague, Texas. 1,097,715. May 26, 1914. Filed Apr. 2, 1912. Serial No. 688,071.

Coaling Device. D. Hilleman, Jr., Welleston, Mo. 1,097,434. May 19, 1914. Filed May 24, 1913. Serial No. 769,677.

Gas Producer. H. F. Smith, Lexington, Ohio. 1,098,059. May 26, 1914. Filed Sept. 20, 1912. Serial No. 721,417.

Horizontal Coke Oven. C. Still, Recklinghausen, Germany. 1,098,188. May 26, 1914. Filed Jan. 23, 1914. Serial No. 672,928.

Smoke-Consuming Heater or Boiler. E. C. Hock, Buffalo, N. Y. 1,097,718. May 26, 1914. Filed Oct. 1, 1913. Serial No. 792,793.

Circulating Tube for Steam Boilers. H. S. Vincent, Ridgewood, N. J. 1,097,830. May 26, 1914. Filed Jan. 26, 1911. Serial No. 814,357.

Process for the Production of Coke. L. Franck, Luxemburg, Luxemburg. 1,098,359. May 26, 1914. Filed Jan. 6, 1914. Serial No. 810,675.

Locomotive Furnace. F. F. Gaines, assignor to American Arch Co., New York, N. Y. 1,097,125. May 19, 1914. Filed July 24, 1913. Serial No. 780,961.

Smokeless Boiler Furnace. F. A. Shoemaker, assignor to Sturdy Smokeless Furnace Co., Buffalo, N. Y. 1,097,735. May 26, 1914. Filed July 5, 1912. Serial No. 707,722.

CONSTRUCTION NEWS

Barbourville, Ky.—The Dean Coal Co., with mines in the Brush Creek field, is preparing to electrify its mines. Contracts have been let and it is said the installation work will begin at once.

Huntington, W. Va.—Practically all of the electric apparatus at the Island Creek tipple has been dismantled and is being placed on barges to be shipped to Secatan, Ind., this being the lower loading station of the Island Creek Co.

Pikeville, Ky.—The Allegheny Coke Co. is preparing to build a number of steel coke ovens at an expenditure of $20,000, to be used as equalizers between the mine output and shipments, as it frequently has happened that the output

exceeds the capacity of the 150 ovens now in use, or that both exceed the market orders, and conversely.

Huntington, W. Va.—According to an authoritative report, the Baltimore & Ohio R.R. is making active preparations to extend its line from Kenova up the Big Sandy River to the mouth of Shelby Creek, just below Pikeville. This line has been contemplated for some time. The route has already been surveyed, and it is believed that work will start in the near future.

Bluefield, W. Va.—Two new operations are being opened on tributaries of Widemouth Creek, the operators being the Modoc Coal Co. and the Pocahontas Co. The Norfolk & Western now has under construction a two-mile track leading up the hollow to the new operations, the steel for which is now being laid. It is expected that coal shipments will begin in a few weeks.

Houston, Texas—Plans are being worked out for a large coal wharf to be built on the south bank of the Houston ship channel at Magnolia Park. This wharf will be equipped with all modern appliances for rapid and economical handling of cargoes from ships to cars for distribution throughout Texas from the Southwest.

Harrisburg, Penn.—An ordinance providing for the construction of the proposed electric hoist to handle the great quantity of river coal on the Susquehanna River wall wharf will likely be passed by the Council in a short time. The plans were given to Warren H. Manning, the park expert, on Aug. 6, for approval. The Harrisburg Light and Power Co. wishes to erect the elevator.

New Albany, Ind.—Extensive coal chutes are to be erected in this city by the Monon Ry. Co., and the engines which heretofore have been coaled in Louisville will receive a supply of fuel in this city. The contract for the new chute has been let, and it is expected that work on the structure will begin within a short time. It is understood that all machinery will be electrically operated.

Charleston, S. C.—Plans are being prepared by the Southern Ry. for the construction of a large coal terminal at Charleston. A tract of 114 acres with 4000 ft. river frontage has been purchased from the Stonega Coal & Coke Co. This improvement will afford coal operators on the Southern Ry. an opportunity to engage in the coal export trade. The total amount to be spent by the railway will exceed four million dollars.

War, W. Va.—The Link Belt Co., of Philadelphia, was recently awarded the contract for a complete shaking screen tipple by the Warrior Coal & Coke Co. This equipment consists of a dump hopper at the drift mouth, into which the coal will be discharged from the mine cars, and from which it will be fed through a long apron conveyor which makes delivery to the shaking screen tipple at the foot of the hill. Here it will be sized into the various grades, the lump and egg being loaded to the cars by means of a loading boom.

NEW INCORPORATIONS

Cleveland, Ohio.—Papers have been filed by the Standard Pocahontas Coal Co. increasing its authorized capital from $400,000 to $500,000.

Mt. Stirling, Ky.—The Rush Branch Cannel Coal Co. has been organized, with a capital stock of $10,000. The incorporators are R. H. Winn, John A. Judy and Lewis Apperson.

Cleveland, Ohio—The Northumberland Collieries Co. has been organized with a capital stock of $10,000. The incorporators are C. C. Owens, H. T. Clark, W. S. Fleming, E. R. Diehm and F. S. Whitcomb.

Nashville, Tenn.—The Red Moon Coal Co. has been organized in Campbell County, with a capital of $15,000. The incorporators are J. L. Hefferman, S. B. Hefferman, B. F. Shuck, C. J. Cross and Charles Hughes.

Charleston, W. Va.—The Gaymont Coal Co. has been organized to operate in the Mountain Cove district of Fayette County. The authorized capital is $2000 and the incorporators are C. C. Beury, J. P. Vaughn, A. S. Guthrie, C. C. Lewis, Jr., and D. V. Reese, all of Charleston.

Central City, Ky.—People interested in the Central Coal & Iron Co. have filed articles of incorporation for the Green River Power Co., which projects an electric plant and an electric railway, a gas company and a land company. A carload of scrapers has been received and it is understood that actual construction of the railway will be begun at once.

INDUSTRIAL NEWS

New York, N. Y.—The John Simmons Co., manufacturers of the Baldwin carbide lamp, has gotten out for the use of engineers using its lamps, a table of natural sines and cosines, on heavy celluloid of a size that can be conveniently carried in the note book.

Columbus, Ohio—The National Coal and Fuel Supply Co. has moved its headquarters from Lancaster, Ohio, to Columbus and opened offices in the Hayden Bank Bldg. The company has a large acreage of coal lands in Noble and Monroe counties under lease.

Rochelle, Ill.—The Geo. D. Whitcomb Co. has taken over the busines of the C. K. Davis Mfg. Co., of Detroit, covering electric storage battery locomotives. Owing to his condition of health and his many other ventures Mr. C. K. Davis decided to dispose of his interests in this business.

Birmingham, Ala.—As a direct result of the European war a local coal broker received recently an inquiry for quotations on an order for coal up to 50.000 tons. It is expected that the inquiry will be followed by other requests for quotations on coal from this district, and the result will be a wonderful business from this unexpected source.

Columbus, Ohio—Apparently the war has no effect upon the coal trade. In all districts of Ohio, both steam and domestic users are buying as well as can be expected and it is believed by Columbus coal men that the war if continued for some time will have the effect of helping the situation as it will take much Pocahontas coal to the seaboard for bunker purposes and thus widen the market for other grades.

Tuscaloosa, Ala.—On account of the failure of Congress to pass the Rivers and Harbors appropriation bill, all work on Lock 17, situated nearly 20 miles above Tuscaloosa, on the Warrior River, has been stopped. As work on Locks 2 and 3 will not be stopped, this will not interfere with present development of mines on the Warrior up to Tuscaloosa, but the failure to continue work on Lock 17 means that the development of mines above that point and the proposed barge line, will be delayed at least a year.

Spartanburg, S. C.—The Clinchfield Fuel Co. has been awarded the contract to furnish the fleet of the United Fruit Co. with coal for a period of three years. This will be placed on board the steamers at Galveston, Texas, where the company is planning to build a large storage pier. Contracts have also been made with many different steamship lines for furnishing Clinchfield coal for bunker use at Galveston and Savannah. These contracts exceed 2,000,000 tons, and are over 500,000 tons more than last year's business thus far.

Birmingham, Ala.—A petition for authority to advance the coal rate from all of its Alabama mines to Birmingham points 10c. per ton, and to advance its present rate on coal to certain manufacturing industries located at Anniston, Gadsden, Alabama City, Attalla, Sylacauga and Talladega, Ala., from 50c. to 70c. per ton, has been filed with the Railroad Commission of Alabama by the Louisville & Nashville R. R. A similar request to advance rates was made by the Frisco R. R. These petitions are considered among the most important the Railroad Commission has ever had to consider.

Harrisburg, Penn.—Anthracite coal shipments in July aggregated 5,391,857 tons, a decrease of 95,995 tons from the same month last year. For the calendar year to date shipments total 38,337,646 tons, or 2,002,000 tons less than last year. Delaware and Hudson, Erie, and Lehigh Valley were the only companies to show an increased tonnage for July. Shipments of the first named showed the unusual increase of 82,093. Lehigh Valley tonnage was larger by 14,238 tons. Reading's shipments fell off 70,798 tons and Central R.R. of New Jersey's 66,659 tons. All companies except the Pennsylvania show decreases for the seven months ending with July, and the increase there is small.

Cincinnati, Ohio—According to Judson Harmon, one of the receivers of the Cincinnati, Hamilton & Dayton R. R., the road is carrying considerably more coal this year than last, and at less expense. Last year the road hauled 1,300,000 tons of coal during the season, from Apr. 1 to Nov. 20. Up to Aug. 1 of this year, however, the figure had already passed the million-ton mark, in spite of an extraordinary dull season, making it seem fairly certain that the 1913 record would be broken by a wide margin, and that the road would earn a much larger revenue per ton hauled, as the expense of handling the traffic has been reduced. This is an encouraging indication of better times for the road.

Coal Trade Reviews

General Review

Anthracite at the low point of the year with individuals making heavy cuts in the circular. Bituminous market replete with conflicting reports. Sentiment generally better. Negotiations for future delivery are at a higher level. Lake shipping continues unsatisfactory.

The anthracite market continues dull and flat. The steam sizes are moderately short because of the rigid curtailment in the mining regions and as a result the better grades are steady at the full circular, though concessions are still obtainable on the off qualities. Egg coal is under heavy pressure, and stove is firm. Anthracite has not been affected by the European war, with the possible exception of at the Canadian border, where it is feared that treaty complications may arise, cutting off shipments, and a heavy stocking movement is under way in anticipation thereof. As a rule the individuals are forcing the market with substantial concessions on the regular circulars.

While the current bituminous market continues relatively heavy, the situation is rather mixed, and replete with portentious possibilities. So far the European war has only interfered with shipments, several foreign vessels calling at Hampton Roads for cargoes, having turned back again rather than risk capture. Steamers sailing out of New York Harbor, however, are said to be taking large surplus tonnages, and the fact that the leading bunkering and export company at that point is working full capacity and holding all production close is significant evidence of the trend of conditions. Conservative members of the trade are inclined to go slow, but some companies are beginning to speed up operations, thoroughly convinced that the turning point has been reached. Premiums on future deliveries are already being offered.

The situation in the Pittsburgh district is even more discouraging, with the line trade still further reduced, and the movement in the Lakes disappointing, though an improvement is expected before the end of the month. Pittsburgh operators will not benefit by any increase in the export trade as a result of the foreign war, except as they may be called upon to make up deficiencies created by such demand. There is a general feeling that stocks in the hands of consumers are at a low point ,and the development of any extra outside demand would create an active situation.

The approach of the stocking up season is bringing out many inquiries in Ohio, and operations are being rapidly resumed. The steam business is also opening up better, while the Lake shipping is one of the best features of the market; chartering is active, and large tonnages are being moved though it is clear that the total for the year will not equal last season's. The market is quiet at the present, and some difficulty is experienced in maintaining the circular.

Though Southern consumers continue holding off in anticipation of a break in the market, the situation is becoming steadily stronger, with the approach of the fall buying season. The possibility of a heavy demand for foreign shipments at the Southern ports is also having a beneficial effect. Many inquiries are being received in the Middle Western. trade which, supplemented by advances in the circular, indicate a strong situation shortly. The Ohio coals are in conspicuously strong demand, and it may be some time before any of these can be received. Prices are steady to firm.

ATLANTIC SEABOARD

BOSTON

A broad market expected shortly, but chiefly for export; summer tieup regarded as only temporary. Premiums paid for future shipments. Local situation improves, but no great demand anticipated. Outlook favorable for Georges Creek and Pennsylvania grades. Anthracite quiet.

Bituminous—There are all kinds of opinion in the trade as to the effect of the European war on early fall business, but most people are agreed that by October or November there will probably be a broad market for coal, especially off shore. The tieup of transatlantic business threatened for a few days to flood the tidewater trade with the coal brought down for bunker use, but that situation has been pretty well adjusted by increased requisitions from the ships that are still in the service. The Hampton Roads situation has also changed within a few days. Some of the shippers, who are closely in touch with foreign buyers, are looking to heavy business, and are very cautious about commitments coastwise for September and October. Already, premiums are said to have been paid for futures; up to $3 f.o.b. has been rumored, and there can be no doubt now of a fairly active market as the season advances. In other lines there is much confidence of heavy dealings with other countries by reason of the war, and particularly with South America.

Locally the Pocahontas and New River market has continued to improve, especially as regards prices obtained. The "market-cargo" menace seems to have been pretty well ironed out. Stocks are large everywhere, and it is not expected there will be a very insistent call from this section for the West Virginia coals, even if prices do advance materially. In other words, conditions in New England are not likely to be affected very much, whatever price development there may be the next two or three months.

The demand for Georges Creek continues to improve and shippers of this grade are also anticipating an extra demand off-shore. The "Kronprinzessin Cecille," at Bar Harbor, Me., is taking aboard two cargoes of that grade.

If there is a material advance in prices at Hampton Roads, there will certainly be a wider market for the soft-coal output of Pennsylvania. Many of the shippers are now well supplied with orders and feel confident that there will be ample business the balance of the year. The all-rail trade shows a gain, particularly in the sections where low-priced tidewater coal is no longer a factor.

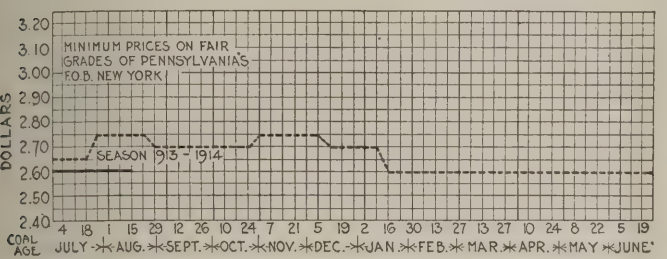
Anthracite—The mines are still under curtailment and will remain so until the fall demand opens up. With several of the companies, stove is still the size in shortest supply, and boats are occasionally detained for that reason. The movement to the consumer is rather slow beginning this season, but by September dealers are expected to be calling for fresh supplies. The prospect is good for a strong market during the fall and winter. The efforts of independents to sell at prices well below the company circular have so far had only a negligible result.

Retail prices in Boston were advanced 25c. Aug. 10, making stove and egg now $7.75 per net ton delivered.

Wholesale prices on bituminous are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.90@1.45	$1.20@1.70	$1.67@1.77	
Philadelphia*	2.15@2.70	2.4 @2.95	2.92@3.02	
New York*	2.45@3.00	2.7 @3.25	3.22@3.32	
Baltimore*	.....	.....	2.85@2.95	
Hampton Roads*	.....	.....	.....	$2.80@2.95
Boston†	.....	.....	.....	3.58@3.78
Providence†	.....	.....	.....	3.53@3.68

* F.o.b. †On cars.



NEW YORK

Bituminous situation full of uncertainties. Indications point to a sharp advance. Bunkering and export business erratic. Numerous inquiries of all kinds. Anthracite heavy and dull.

Bituminous—The local situation is distinctly mixed, business being conducted on a day to day basis, the general tendency being to hold off pending further developments. Predictions as to the future trend of conditions are conflicting almost to extremes. The more conservative old-line companies entertain great doubts as to the future while the more aggressive factions assert positively that the market is on the verge of a sharp advance of from 50c. to $1 per ton within the next 30 to 60 days at least. It is agreed by all that there are foreign and domestic inquiries for enormous tonnages in the hands of the agencies, and should these develop into actual business and the problem of securing water transportation be solved, an active situation will result. That our government will work out some method whereby foreign vessels can be utilized for shipment to neutral ports is the firm belief of the trade.

Generally speaking there has been a complete disruption of the bunkering and export trade at Tidewater though it is a significant fact that there is little accumulation of surplus coal; in fact one company reports current supplies now at the lowest price for several years. The Berwind-White Co., who practically control the export and bunkering business in New York Harbor, are working their mines at full capacity ,and holding their coal closely. It is stated that the liner "Olympic," which sailed the early part of the week, carried 25,000 tons of coal, and that all other vessels are loading heavily.

In spite of the many uncertainties now prevailing, the current market is not quotably changed from the past few weeks which we continue as follows: West Virginia steam, $2.50@2.60; fair grades Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The hard-coal market continues dull and uninteresting. Unlike bituminous it will not be effected by the European wars except insofar as some tonnages are used to replace bituminous coal diverted into other channels. It is believed that consumers as a rule have bought less than in former years, and the stocks at Tidewater are somewhat lighter than customary at this period.

Broken and egg coal are about holding their own as regards supply and demand although there is possibly somewhat of a surplus of egg coal. Stove is in short supply but not sufficiently so to command a premium on average business. Chestnut is by far the weakest of the domestic grades; it is offered at concessions ranging from 25 to 50c. from the regular circular, and is even then difficult to move.

The restricted operations in the mining regions have had a steadying effect upon the steam sizes, the better qualities being in more demand at the full circular. The poorer grades are in excess supply, and are obtainable at less than the circular. The line trade in anthracite as a rule is improving.

The New York hard coal market is quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.00	$4.60@5.00	$4.95	$4.55@4.95
Egg	5.25	4.90@5.25	5.20	4.85@5.20
Stove	5.25	5.15@5.25	5.20	5.00@5.20
Chestnut	5.50	4.95@5.50	5.45	4.75@5.45
Pea	3.55	3.40@3.55	3.50	3.25@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	1.90@2.75
Rice	2.30	2.15@2.30	2.00@2.25	1.50@2.25
Barley	1.80	1.60@1.80	1.75	1.25@1.75

PHILADELPHIA

Anthracite continues stagnant, although inquiry is improving and prospects better. Early fall demand is expected soon. Bituminous prices unchanged, and demand about the same.

Anthracite—There seems to be an undercurrent of better feeling, due to the fact that there is considerably more inquiry. It is expected that the fall business will open up more favorably than is usually the case, and this is already indicated in the tidewater business. Quite a volume of business is already coming in for late August delivery.

Locally the trade still continues stagnant. There is very little coal being consumed, and as the price is but 10c. below the maximum for the year, inducements to buy are not particularly strong. The individual operators still force business with attractive prices. Egg and chestnut are offered at the April circular, and on the medium grades, concessions from the circular on stove are obtainable. Pea is selling at most any price to move it; as a matter of fact, chestnut and pea seem to be the stumbling blocks in the way of an increased production. Prices are:

	Circular	Individual
Broken	$4.65	$4.65
Egg	4.90	4.60 @ 4.70
Stove	4.90	4.90
Chestnut	5.15	4.90 @ 5.00
Pea	3.25	3.00

Bituminous—There is considerable speculation as to the probable result of the Continental war on the bituminous trade. Up to the present time, very little in the way of tangible business has been received. The tieing up of numerous ocean vessels has caused some congestion at tidewater points, but the actual domestic market has not changed.

BALTIMORE

Attention centering on the export trade and inquiries arriving. Anthracite and bituminous business on domestic account very flat.

With the Welsh mines closed to outside markets, and with the growing demand for American coal indicated in cable inquiries that are being received in this country, the trade is wondering just how much of this will develop into actual business. Even if unable to build up trade with the warring nations themselves, the American producers and agencies may find it possible to break into the South American and Mediterranean business. The transportation question is the main problem, but this will surely be solved as the demand from the other side is so urgent that purchasers will assume all risks. It may be some weeks, however, before this situation develops into actual business.

In the domestic trade there is little of interest. Demand is poor and prices on the same level. There is more of a congestion at tide than has been noted for some time past, and it would not take much to start more price cutting. An increasing export trade now would indeed prove a blessing.

Slack continues falling off, West Virginia products being sold as low as 50c., with three-quarter gas offering at 85c. Pennsylvania coals held steady, cheaper grades being on the market at slightly below the dollar mark, and the better fuels running from $1.15 to $1.35.

Anthracite—Companies report a free movement on contracts, but very little doing in the way of new demand.

Coastwise Charters hold firm, and shipping interests are figuring that if there is a growing South American demand for our fuel, rates will advance. Many vessels of the strictly domestic fleet could be used for more distant delivery.

HAMPTON ROADS

Dumpings at Hampton Roads piers only about fair; war in Europe interfering with the bunker trade. Prices continue unchanged.

Dumpings for the week have been fair. Coastwise shipments have improved, perhaps, to some extent, although little coal is moving except by steamers. A large number of schooners in this trade have been taken off and are remaining idle until conditions improve. The largest coastwise shipment to leave this port for some time was loaded during the week into the American S. S. "Arizonan," which took 11,183 tons from Lamberts Point for the U. S. Naval Station at Mare Island, Calif. The bulk of the coal for the New England market went to Boston, although some shipments moved to Portland, Allyns Point, Bangor and Fall River.

Prices on New River and Pocahontas as well as on the high volatiles remain about the same as they have been for some weeks, with little demand for spot shipments on either grade.

War between the European countries is causing the bunker trade to suffer, as few cargo vessels are leaving the Southern ports. Such bunkers as are arriving here, in a majority of cases, are remaining in port, although some few are risking capture and taking the chance of reaching their European destination.

Foreign cargoes for the week have been loaded for Canal Zone, St. Lucia, Fray Bento, Santiago, Venice, Naples and La Plata. Some of these vessels were loaded before war was declared between England and Germany. It is understood that one of the British steamers which has a cargo for Italy will remain in port for some time or until there is less danger of capture.

LAKE MARKETS

PITTSBURGH

Mine operations unchanged, at close to 70% of nominal capacity. Prices continue very irregular. No definite influence felt in the district on account of the war thus far.

The coal trade of the Pittsburgh district has not been particularly affected by the war thus far, though doubtless it is going to be affected indirectly, through the influences of other markets, which have to do with Tidewater shipments. Line demand has experienced a slight further decrease in the week, stocks being reduced and operations in the steel

industry increasing slightly. The steel trade expects considerably more activity than would have been the case without the war. Ocean freight movement is expected to be restored shortly, at least in a way, and there ought to be a very heavy export movement, seeing that the United States has hitherto been exporting only about 2,500,000 tons of iron and steel a year, while England, France, Belgium and Germany have had the rest of the international market, about 10,000,000 tons a year and are now practically shut off from shipping at all.

The lake coal movement continues disappointing but there are still predictions that shipments will be heavier before the end of the month. Satisfaction is expressed that the decision in the rate case eliminates any possibility of coal freight rates being advanced. Mines are operating at close to 70% of nominal capacity and prices continue very irregular. Circular prices, which are nominal even as to contracts, are as follows: Slack, 80@90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in., $1.50, per ton at mine, Pittsburgh district.

BUFFALO

Slight improvement in bituminous, but no real activity as yet. Excess supplies still in consumers' hands. Anthracite finds a rushing war sale in Canada, but little elsewhere.

Bituminous—There is a somewhat better movement all along the line and fewer reports of coal selling at sacrifice prices. It is not expected that there will be any improvement of account till the worst of the war scare is past, as some factories are shutting down, especially in Canada. The effect of the war will be serious on all industries, though it may not last long.

It is becoming more evident each week that the coal in consumers' hands is steadily disappearing, whether the consumption is increasing or not. More coal must be bought from this time on if business is to continue as usual. At present everybody is feeling the effect of the war in one way or another. It is the uncertainty as to the duration of the war that is making most of the trouble.

One or two of the larger companies with headquarters in this district are running their mines at full capacity, on the supposition that there will soon be a heavy European demand for coal, but actual orders are still lacking.

Prices of bituminous are possibly a trifle stronger, on the basis of $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run, and $2.15 for slack, with slack not as active as formerly. Allegheny Valley sizes are about 25c. lower than Pittsburgh. Only the very best coal can be sold at quoted rates.

Anthracite—There is no improvement in the local or line trade and none is anticipated at present, but Canada is buying urgently. Orders are coming in for hundreds of cars from single concerns in Toronto, while other towns on that side of the border are buying briskly. The idea is that something may happen that will in some way shut off the supply. The International (Grand Trunk) bridge opposite this city is guarded by troops, and it is suggested that the Buffalo end should be guarded also.

The Lake shipment of anthracite has fallen off somewhat for the reason that the agents of the companies cannot get the coal freely, and since the Canadian demand has set in it cut down receipts materially. Shipments for the week were 144,000 tons, which is quite below the Lake average for the past two months. It is said that the dock capacity at Upper-Lake ports is not what it was, and that some of the shipping companies at least will not long be able to keep up the former pace.

TOLEDO

Canadian and Lake shipments not effected by neutrality laws. Possibilities of the European war. Market quiet at the moment but with an excellent undertone.

Shipment on the Lakes is not included in the neutrality laws according to advices to the Toledo customs office from Washington, D. C. This will release considerable delayed coal. Opinions concerning the effect of the European war on the local markets vary but it is generally thought that should the war be a long drawn out affair the coal business of the United States will be benefitted although the first effects will be a slowing up.

It is probable that considerable American coal will be sent to Canada and the demand there will be largely for the smokeless variety. Just at present slack is a drug on the Toledo market and dealers are finding trouble disposing of stocks. Business is reported somewhat dull in some sections but showing improvement in others. Dealers seem to be buying a little more freely. A car shortage is looming up in the near future and in fact some complaints are already sifting in.

COLUMBUS

Operation of mines in most districts is being resumed. Eastern Ohio operators fail to agree with the miners. Coal now being shipped to the Lakes.

The past week has seen a general resumption of mining in the Hocking Valley, Jackson, Cambridge and Pomeroy districts. In the Crooksville section, the scale was also adjusted, and preparations have been made to resume work Aug. 10. On every hand, the situation is clarifying with the exception of eastern Ohio.

Sales managers report a good demand for both domestic and steam grades. Dealers are getting ready for the stocking-up season, which is expected to be active towards the latter part of the present month. Buying of domestic sizes is going on actively and most of the orders are for immediate shipment. It is expected that domestic prices will be advanced after Sept. 1. There is a marked preference shown in the domestic trade for Pocahontas and rescreened varieties.

The Steam Trade is active, although West Virginia coal in the local trade affects quotations. Manufacturing plants have little surplus on hand and they have been waiting for the settlement of the strike before entering into contracts. Very few contracts have yet been closed, but negotiations are progressing. Prices on steam contracts are expected to be about the same as the previous year.

The Lake Trade is now one of the best features of the industry. Some of the larger operators in the Hocking Valley are shipping a heavy tonnage to Lake ports for passage to the Northwest. While the shipments this year will not be equal to last season, a good trade is expected from this time until the close of navigation. Chartering of boats is going on actively and the supply is adequate. The Toledo docks of the Hocking Valley Ry. have hauled 1,281,000 tons since the start of the present season.

Prices in the Ohio fields:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Rescreened lump	$1.60		$1.65	$1.50
1¼ inch	1.50		1.50	1.50
¾-inch	1.30	$1.20	1.35	1.30
Nut	1.15		1.35	1.15
Mine-run	1.10	1.05	1.15	1.10
Nut, pea and slack	0.65		0.65	0.60
Coarse slack	0.55	0.60	0.55	0.50

CLEVELAND

Broader inquiry, but demand is still light. Prices are barely holding on slack and larger sizes are moving slowly. The retail trade is materially improved over a week ago. Lake business does not change.

Excepting in the retail trade, the sales of coal are rather limited. Slack is selling at $1.55 to $1.60 without a large working balance on track. Steam sizes are being sold largely on orders for shipment. The demand is so light and the market in such a weak condition, consignments are not being sent here to any extent.

Pocahontas prepared sizes are short and the Pocahontas Fuel Co. is refusing orders for lump and egg for future shipment. In a letter to one of the jobbers recently, the sales manager of that company said a large South American trade is expected in the near future, which will cause an increase in prices.

Massillon operators, who failed to make a contract with the miners last week, have signed up individually and are quoting domestic sizes, lump and washed nut, at $2.50 at the mines. While no circular quotation is being made on Massillon slack, operators are tentatively naming 95c. at the mines as a fair price. The freight rate to this market is 70c.

Hocking mines have been so greatly hampered by local labor troubles that quotations have been withdrawn for two weeks by many of the companies. These and the No. 8 are the only mines now closed. The conference of the miners and operators of the No. 8 field at Wheeling failed to effect an agreement, and there are no immediate prospects of cleaning this up now. A large amount of coal has been sold to the trade regularly using No. 8 coal.

With new grain arriving at the Upper Lake ports, shipments of coal from the docks to interior points are improving. The betterment is slow, but shippers are preparing to do a larger business the latter part of this month.

Quotations are as follows:

	Pocahontas	Youghiogheny	Fairmount	W.Va. No. 8
Lump	$3.60			
Lump, 1¼ in.		$2 50		
Lump, ¾ in.		2.20@ 2.25	$2.05	$2.05@ 2.10
Egg	3.60			
Mine-run	2.60	2.15	1.95	2.00
Nut		2 20		
Slack	2.35	1.55@1.65	1.70	1.55@ 1.60

CINCINNATI

The market continues sluggish. Production increasing in the idle fields and the demand fails to pick up. Lake movement is increasing in volume. Possibilities of the war situation.

Dealers still show a marked disinclination to buy at circular prices, because of the slow demand, and while operators are firm in their refusal to make concessions, they are selling little coal. Deliveries on old contracts comprise most of the business at present, and few new contracts are now being closed. The sluggishness of the steam market even exceeds that on the domestic side; the resumption of the various steam consumers is slow, and in some cases hardly perceptible.

The European trouble is naturally the subject of much comment. The principal effect hoped for is a marked stimulation of the numerous industries which have been working on short time; on the other hand, a more pessimistic view contemplates the possibility of a still wider depression, due to inability to secure ocean carriers.

DETROIT

Market slow and quiet but generally firm. Shortage of labor. Heavy business anticipated this fall.

Bituminous—The local market has been slow, yet not particularly bad; steam trade has been passibly good in the city, the smaller sizes being in a little better demand and prices steadier than for several weeks past. The domestic trade has fallen off due to the inability of the dealers to secure labor to unload the cars as a result of the heavy demand along other lines that are now starting up.

COKE

CONNELLSVILLE

The coke market shows absolutely no signs of life. The furnaces in operation are evidently fully covered through this month at least, and it is questionable whether any fresh purchases will have to be made even for September. Idle merchant furnaces are showing no disposition to go into blast, particularly with the situation further complicated by the war. The steel mills expect larger production eventually, on account of increased exports, their competitors abroad in the international iron and steel markets being all at war, and thus eventually the consumption of coke may increase through additional steel works furnaces blowing in. Prices may be quoted nominally at the former level: Prompt furnace, $1.75; contract furnace, $1.75@2; prompt foundry, $2.25@2.35; contract foundry, $2.35@2.50, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Aug. 1, at 269,575 tons, an increase of 1285 tons, and shipments at 269,591 tons, an increase of 2230 tons, shipments and production being balanced.

BUFFALO

The local coke trade is still "flat." Bituminous will show the first real improvement and that will make it necessary to advance coke. Some think that the iron trade will be first to start, but coal has taken the lead sometimes and may do so again. Few dealers care to handle coke, as they declare there is more difficulty with it now than there ever is when business is brisk. Quotations remain on the basis of $4.25 for best 72-hr. Connellsville foundry and $3.25 for stock coke.

DETROIT

Connellsville foundry is bringing $3 on the local market, Semet Solvay $3.50 and gas house, $3.25, f.o.b. ovens.

BALTIMORE

Coke remains a drug on the market. Officials of the Maryland Steel Co. are figuring, however, that the war may bring them some increased activity in the end.

BIRMINGHAM

While the actual business being done in furnace and foundry coke has not materially improved, still, the operators believe that conditions are better.

CHICAGO

So far as coke is concerned, the situation remains about the same. Domestic is a little more active owing to a slightly better demand. Prices are: Connellsville and Wise County, $5; byproduct egg, stove and nut, $4.75; gas house, $4.25.

SOUTHERN

BIRMINGHAM

Lump coal dull. Steam grades show some improvement. European war creating much inquiry. Bunkering and export business expected to increase in next two weeks.

The market on lump coal does not seem to improve to any extent, very few orders being received, and no immediate increase is looked for in this line. The retail yards are still holding off placing orders, believing that the operators will lower prices, but with fall approaching, the producers are not inclined to reduce quotations, preferring to run on short time rather than sacrifice their lump coals.

While the demand for steam coal is just about the same as last week, the outlook is encouraging for an early resumption of full-time operations because of the European war; inquiries are being received by many of the operators for a large tonnage, approximating 1,500,000, for shipment to Mobile and Pensacola. While it is not certain that this business will be obtained, it is evident that this section will be called upon to supply a large amount of coal through the Gulf ports should the war last long. Birmingham operators expect this business will materialize within the next two weeks.

LOUISVILLE

Increases and decreases caused by foreign wars will about equalize each other. Some improvement with the approach of fall.

Kentucky coals are in better demand than they have been for some time. Some of the operators are of the opinion that the war in Europe, provided it is prolonged, will very largely increase the demand upon the American mines; others figure that increased requirements will be more than offset by similar decreases, so that one will balance the other.

The results from the war on this market will be generally indirect. It is admitted that a large demand on the Eastern coals would have the effect of diverting local fuels into new channels, although but little will reach to the coast. On the other hand, some Kentucky manufacturing enterprises, notably tobacco plants, the entire output of which goes abroad, have shut down altogether to await developments.

Most of the improvement in the demand is normal so far, due to the fact that the summer is drawing to a close and that dealers are stocking up. Prices remain unchanged from a week ago.

MIDDLE WESTERN

INDIANAPOLIS

Mining slightly improved, due to increased domestic demand for winter storage. Inquiries from factories better. Indianapolis retailers make their second summer advance in the circular.

There is little change in the Indiana situation. The demand for domestic grades shows some improvement, as retailers have made their second summer advance, and it has stimulated the buying of the winter stores. Railroad buying is somewhat better, but not up to expectations.

There has been a little gain in mining operations, more particularly in the Brazil block field, but there are signs of slackening again, now that threshing of wheat and oats is practically over. The mines have had a month of continuous work, and there will now be a lull until the regular fall rush opens. The southern Indiana mines report more inquiry from factories, which seem to be preparing for larger operations.

Indianapolis retailers have advanced prices 25c. a ton and guarantee only August delivery at the new basis, though it may remain longer.

The new schedule of retail prices in this city is:

Anthracite, chestnut	$8.25	Winifred, lump	$4.50
Anthracite, stove and egg	8.00	Hocking Valley, lump	4.50
Anthracite, grate	7.75	Luhrig, lump	4.50
Pocahontas, forked lump	6.00	Luhrig, washed egg	4.75
Pocahontas, shoveled lump	5.50	Cannel	6.00
Pocahontas, mine run	4.50	Linton No. 4 lump	3.50
Pocahontas nut and slack	3.75	Linton No. 4 egg	3.50
Blossburg	5.50	Sullivan No. 6	3.50
Jackson (Ohio)	5.25	Indiana washed egg	3.75
Kanawha, lump	4.50	Brazil block	4.50
Kanawha, egg and nut	4.25	Connelsville coke	6.00
Pittsburg, lump	4.50	Citizens egg coke	6.00
Raymond, lump	4.50	Citizens nut coke	6.00

CHICAGO

Local operators cautious over future commitments. European war seriously affecting the situation. Large shortage of Hocking grades.

Carterville operators are expecting a good demand from the domestic buyers. On lump and egg coal, the larger producers are holding for $1.50 at the mines and accept lower prices only on orders placed prior to Aug. 1. Smaller operators have fixed $1.35 as the minimum on lump and egg. A few of the larger companies in the Franklin County field report that they are obtaining $1.60 for lump and egg. In the central Illinois field, screenings are on a decline.

The Anthracite situation shows slight improvement. The leading companies report that the market is considerably behind what it was at this time last year, some estimates placing it at 20 per cent. less.

Small shipments of Hocking coal are being received but orders are probably already in excess of what can be obtained for some time. The opening price is $1.50, the same as the market closed at on Apr. 1.

Prevailing prices in Chicago are:

	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump	$2.07	$2.45@2.65	$2.12	
Steam lump	1.87@1.92		1.97	
Egg		2.45@2.65		$4.05
Mine run	1.87	2.15@2.25	1.87	3.30
Screenings	1.52@1.57	1.75@1.80	1.52@1.57	

Quotations on Harrisburg coal are: Domestic lump and egg, $2.40@2.55; steam lump, $2.25; mine-run, $2.15@2.25; screenings, $1.75@1.80; No. 1 nut, $2.55; No. 2 nut, $2.40.

Carterville prices are: Lump and egg, $2.40@2.55; No. 1 washed, $2.55@2.70; No. 2 washed, $2.35@2.40.

ST. LOUIS

Market generally buoyant on most lines. Demand stronger and advances in the circulars. Exceptionally heavy business anticipated this fall.

Many inquiries, with prices advancing, indicates what may be expected in the next three or four weeks. Lump and egg is extraordinarily strong in the high grade market, while nut and screenings and the steam sizes are slow. No. 1 washed has picked up a little in some places, but in a general way it has not improved since last week. In the Standard market, screenings are still on the downward path, with lump advancing slightly. High grade screenings are also dropping off.

Anthracite still continues to move promptly and there is nothing to complain about in the coke market. Smokeless, however, is still slow.

The retailers report exceptionally heavy business for August, and especially on the high-grade coals. Manufacturing plants are not in the market now for various reasons, and this has caused a surplus of steam sizes to accumulate.

In a general way there is nothing to complain of at this time in the local market. The prevailing circular is:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump				$0.90@1.00	$1.10
3-in. lump			$1.30		
6-in. lump	$1.30@1.60		1.40	1.05@1.15	1.20
Lump and egg	1.85@2.15	$2.15			1.15
No. 1 nut	1.10@1.30				
Screenings	0.70@0.75		0.80@0.85	0.55@0.65	0.60
Mine-run	1.00@1.15			0.75@0.80	
No. 1 washed nut	1.40@1.50	2.25	1.50		
No. 2 washed nut	1.25@1.30		1.35		
No. 3 washed nut	1.15@1.20				
No. 4 washed nut	1.10@1.15				
No. 5 washed nut	0.70@0.75				

The Williamson and Franklin County coals take a rate of 67c. to St. Louis, and the retail price is $3.25 to 3.50 per ton. Murphysboro coal takes a 2½c. lower freight rate, and retails at $4 a ton. All other coals take a rate of 52c. a ton to St. Louis. Sparta retails at 11c., Mt. Olive at 11c., and Standard at 9 and 10c. a bushel; 25 bushels to the ton.

The August Anthracite circular (wholesale is: Chestnut, $7.45; egg and stove, $7.20; grate, $6.95. Retail prices are 95c. higher.

KANSAS CITY

Domestic trade a little slow, due to the strike last week. Local and outside trade has profited already by the large wheat crop.

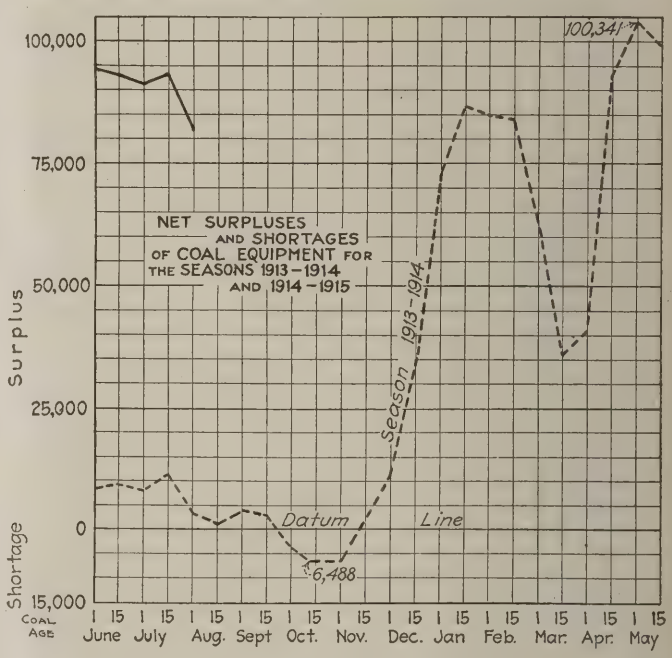
Coal trade in Kansas City was improving to a marked extent until the strike in the Kansas district, Aug. 3. The wheat crop made large business for the thrashing. The temporary financial uneasiness affected the city trade. The most noticeable effect of the strike locally is in steam plants usually burning Cherokee products; those not having any surplus are employing Missouri screenings which are cheaper and satisfactory in an emergency.

PRODUCTION AND TRANSPORTATION STATISTICS

ANTHRACITE SHIPMENTS

Anthracite shipments for July and the first seven months of this year and last year were as follows:

	July		7 Months	
	1914	1913	1914	1913
Phila. & Reading	831,965	902,763	6,863,613	7,761,147
Lehigh Valley	1,026,225	1,011,987	7,181,300	7,604,118
Cent. R.R. N.J.	708,891	775,550	5,097,978	5,351,214
Del. Lack. & West.	826,771	871,677	5,425,277	5,661,037
Del. & Hudson	671,682	589,589	4,087,557	4,094,128
Pennsylvania	406,769	439,912	3,623,848	3,607,018
Erie	717,201	683,161	4,707,228	4,762,953
Ont. & Western	202,362	213,213	1,350,845	1,498,091
Total	5,391,857	5,487,852	38,337,646	40,339,706



THE CAR SITUATION

American Ry. Association reports surpluses and shortages of coal equipment for two weeks ended Aug. 1, as follows:

	Surplus	Shortage	Net*
New England Lines	1,281	0	**1,281**
N. Y.; New Jersey, Del.; Maryland; Eastern Penn.	17,718	0	**17,718**
Ohio; Indiana; Michigan; Western Pennsylvania	41,557	0	**41,557**
West Virginia, Virginia, North & South Carolina	5,447	0	**5,447**
Kentucky, Tenn.; Miss.; Alabama, Georgia, Florida	3,965	0	**3,965**
Iowa, Illinois, Wis., Minn.; North & South Dakota	6,135	0	**6,135**
Montana, Wyoming, Nebraska	984	0	**984**
Kansas, Colorado, Missouri, Arkansas, Oklahoma	1,807	82	**1,725**
Texas, Louisiana, New Mexico	275	28	**247**

***Bold face** type indicates a surplus.

FOREIGN MARKETS

GREAT BRITAIN

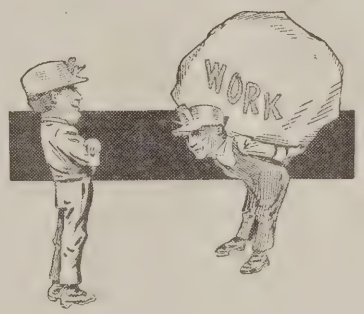
Business is practically at a standstill owing to the European crisis. The British Admiralty authorities have practically placed a lien on the collieries producing Admiralty-List coals.

Quotations are, nominally:

Best Welsh steam	$5.16@5.40	Best Mountainshires	$4.08
Best seconds	4.56@4.80	Seconds	3.84@3.96
Seconds	4.20@4.32	Best Cardiff small	2.58
Best dry coals	4.20@4.32	Seconds	2.46

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those of Monmouthshire descriptions are net f.o.b. Newport; both exclusive of wharfage, and for cash.

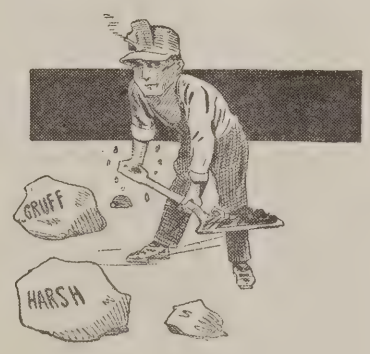
COAL AGE



Vol. 6 NEW YORK, AUGUST 22, 1914 No. 8

To the Beginner

By Berton Braley



Written expressly for Coal Age

So you think the work is heavy
In the coal mine dark?
Well, it ain't no bloomin' picnic
In the public park;
But you'll find it ain't so awful
As it first appears,
Though it sure is mighty wearin'
For the FIRST TEN YEARS.

To the guy who's just beginnin'
It's a durn tough job,
To be underground a toilin'
With the coal-streaked mob;
But when you're hardened to it
Why, the prospect clears,
Though it's mighty lumpy pickin'
For the FIRST TEN YEARS!

You'll find the work is dirty
An' the coal is rough,
An' the pitboss has a manner
That is harsh an' gruff;
With the perspiration drippin'
From yer nose an' ears,
You'll think your job's a hard 'un
For the FIRST TEN YEARS.

An' will it grow more easy
As the long days flit?
Well, if it don't get easy
You'll get used to it;
So drill away contented
An' we'll give three cheers,
Though it's hard to be a miner
For the FIRST TEN YEARS.

Ideas and Suggestions

Environment as a Factor in Individual Efficiency

Do you mine owners realize that environment is a great factor in the cost of your operations? Have you ever looked over your men to see if you are not allowing some of the best of them to grow stale for lack of a change or promotion to increased responsibility?

Listen to this!

For ten years a man held a relatively important position as manager at one of the offices of a big coal-mining concern. He was finally promoted and placed in the general office. His duties required him to visit the mines in the capacity of a general inspector to observe and study conditions and especially to see that too many men were not employed in any department.

One day he visited the office where he had been manager for so many years. One of his old men was now in charge. The rest were in the same relative places. The desk arrangement was the same and there were the same number of men.

Something struck him as strange amid all the familiar scenes. What was it! The men didn't seem to be busy. Why? It seemed to him he used to keep them busy. Now there seemed to be too many of them. How was that? He could remember that some of them used to have to stay at night to get out the work. He observed that a few were rolling cigarettes and for periods of twenty or even thirty minutes there were general conversations about politics, war or religion—all foreign to the work in hand. What was the matter with the place? It was just the same as he left it and yet it didn't look right.

The Value of System

A week later it dawned on him. In the general offices he observed there was a systematic arrangement of work. The men worked shorter hours, got away in the summer months in time to see most of the ball game and had Saturday afternoons off—but during work hours they WORKED. Smoking was not allowed and no general conversations were in order. There was no night work. A vast amount of work was done easily and the men all seemed pleased in doing it.

Like a flash the experience of changed environment bore fruit. He saw what was wrong in his old office. The work hours there were too long and there were too many men. He had been blinded by too close contact coupled with the lack of broader experience.

Just then the general manager rang for him and said:

"We are spending too much money at X mine. Too many men there. Looks like the office force is top heavy. You worked there a long time and ought to know what is the matter. See what you can do."

It was easy for the inspector. Already awake to the occasion it required but little study to accomplish reductions in force which previous to his change he would never have considered possible. New rules and new hours were invoked. The saving per month amounted to more than his own salary. He took an inventory of his former self and how he used his own working hours. Results were seen in evidence. On one trip he saw something entirely out of his line but indirectly affecting operations which seemed worth looking into. He told the "G. M.," who was able to work out a monthly saving of several hundred dollars for the concern as the result of it.

This man from being a mere department head soon became a valuable officer to the concern and saved his employers his own salary many times over during a year. BUT REMEMBER, his talents were buried for years and might never have been developed except for a change in environment.

There's the essential fact of the story—and maybe it will serve to point a moral.

You may have just such a man in your employ. Give him a change and try him out in a new position. You know responsibilities gravitate to the fellows who can shoulder them. Those who can't get under responsibilities you don't really need anyway. The ONE or TWO you may discover who CAN, will make our effort worth dollars to you.

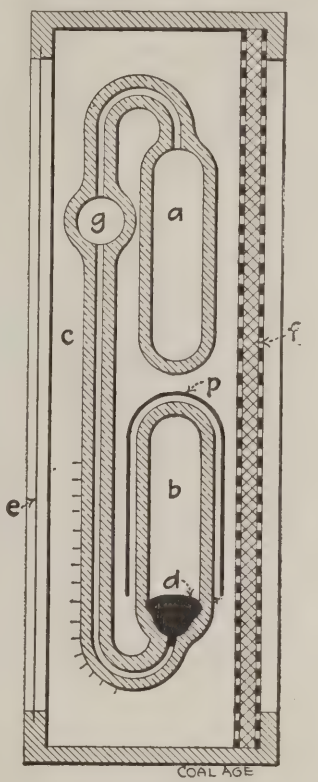
Don'ts for Coal-Mine Employees

The following instructions and safety regulations were taken from an interesting little book of rules gotten out by the Susquehanna Coal Co., of Wilkes-Barre, Penn. This plan of instructing employees is one that might be imitated to advantage by coal companies in every field.

1. Don't forget that the safety department is intended to assist you in protecting yourself and others, but cannot take your place.
2. Don't forget that we will appreciate any suggestions that may tend to further the safety of employees.
3. Don't try to get on a cage or car before it gets there or after it has started to leave, and use particular care in and around shafts.
4. Don't forget that it is safer to walk than to ride where separate travelingways are provided.
5. Don't try to couple or uncouple cars when in motion. It is dangerous, and you are breaking the mine law as well as a company rule.
6. Don't forget when going up or down a travelingway, or about to cross lifts or levels, to stop, look and listen.
7. Don't attempt to couple cars on the short side of a curve.
8. Don't attempt to perform unfamiliar work without previous instruction.
9. Don't stand within swing of tools in the hands of other workmen, nor in front of rivets, bolts or nuts being chiseled off.
10. Don't forget that where there is a live wire there is danger.
11. Don't think because a wire is broken it is harmless; if necessary, remove it with sticks or boards.
12. Don't fail to look out for loose or torn clothing and gloves when working around moving machinery.
13. Don't neglect, when removing cotton from a lamp, to make sure that it is thoroughly put out, and do not throw matches away carelessly.

14. Don't lose your head in case of accident; try to remember the right thing to do—it may save some serious result.
15. Don't fail to report any unusual happening about the colliery or in the mines; it will save future trouble and will be appreciated by your foreman.
16. Don't stand in back of cylinder heads or in front of a crank while engines are in motion.
17. Don't talk to any engineer while his attention is required by his machinery.
18. Don't touch electrical equipment unless it is in your line of work—it is dangerous.
19. Don't fail to observe all rules relating to electrical equipment, whether in your line of work or not.
20. Don't be satisfied with a "good enough" hitch—make it right.
21. Don't allow sharp tools of any kind to lie around carelessly; don't fail to put them in their proper places.
22. Don't fail to observe any warning given you by any person that may affect your own or another's safety.
23. Don't under any circumstances go into any unnecessary dangers.
24. Don't use tools which need dressing or repairs.
25. Don't fail to have all scaffolds erected in a secure and safe manner.
26. Don't fail to remove all dangers from hanging icicles.
27. Don't fail to keep a constant lookout for danger when walking about railroad and mine tracks.
28. Don't fail to obey the rule prohibiting smoking.
29. Don't cross over a trip of cars—walk around it.
30. Don't fail to observe all rules for the handling of explosives.
31. Don't misuse your safety lamp—it is your safeguard.
32. Don't fail to examine your safety lamp and assure yourself that it is in good condition.
33. Don't fail to extinguish the light at once and return your safety lamp to the person in charge; if it is injured or defective, reporting same.
34. Don't remove an accumulation of gas by brushing it, where it is practicable to be removed by bratticing.
35. Don't fail to immediately extinguish a feeder of gas that you may ignite; if unable to do so, notify the official in charge at once.
36. Don't fire any blast when starting batteries or chutes before notifying the men on the gangway.
37. Don't start a battery when blocked 6 or 8 ft. above the battery. Notify the official in charge of said condition and await his orders.
38. Don't travel on any gravity plane or slope while cars are being hoisted or lowered.
39. Don't fail to immediately report to the official in charge anything you may discover wrong that may lead you to suspect danger to yourself or others.
40. Don't fail to observe all provisions of the mine law.

The Guasco Toximeter



The *Journal de Physique Elementaires* recently contained an interesting article, by Monsieur Abel Buguet, on a new type of indicator made by Messrs. Guasco & Co., Paris, France, and termed the "Toximeter." Its purpose is the indication of the amount of carbon monoxide in air, particularly with relation to those amounts which may prove dangerous to human life.

The chemical analysis of the air by the ordinary methods of procedure are more useful in the laboratory than in commercial practice, and hence various attempts have been made to reduce such measurements to processes that can be carried on, as far as possible, continuously and automatically. In 1889, Pitkin and Niblett used a mercury thermometer, the reservoir of which was covered by finely divided platinum. This was installed adjacent to a second thermometer identical with the first, except that its bulb was not platinized. In this arrangement, advantage was taken of the fact that finely divided platinum becomes heated in the presence of carbon monoxide, and the difference of temperature of the two thermometers was sensibly proportional to the percentage of carbon monoxide present. Unfortunately, a dangerous amount of carbon monoxide only registers a difference of one-tenth of a degree in the readings of the two thermometers, and this is too small a difference for commercial practice.

Later, Monsieur Racine, applying the same property of platinum, obtained in the presence of carbon monoxide a temperature that caused the explosion of a filament of guncotton, the rupture of which allowed a bell to be rung. This, also, is hardly suitable for practical use, one reason being that there might be the danger of the filament not being replaced after use. Monsieur Guasco, however, has now utilized the same property of platinum, applying it to one of the bulbs of a differential thermometer similar to that of Leslie.

The device is illustrated in the accompanying diagram and consists of two glass bulbs *a* and *b* connected by a capillary tube *c*. A smaller bulb *g* is blown near the top of the capillary tube, as shown in the cut. The purpose of this bulb is to prevent the colored liquid that is forced into the capillary tube by the expansion of the air in the bulb *b* from passing over into the bulb *a*.

Both the bulbs *a* and *b* contain air. The bulb *b*, as shown in the figure, is covered with a thin film of finely divided platinum *p*, which absorbs the carbon monoxide gas when present and heats, thereby raising the temperature of the air in the bulb *b* above that in the bulb *a*. The bulb *b* contains a small portion of colored liquid, *d*, which, by the expansion of the air in this bulb, is forced upward in the capillary tube *c*. This tube is calibrated to show the difference of temperature between the two bulbs *a* and *b*.

The Guasco Toximeter

In this instrument, advantage is taken of the greater expansion of the air in *b*, due to a very slight difference of temperature between the two bulbs. Also, as in the ordinary thermometer, the effect of the expansion in the bulb is greatly magnified by the capillarity of the graduated tube *c*. The instrument is shown inclosed in a case, on one side of which is a glass window *e* for observing the reading of the thermometer; while on the other side is a porous partition *f*, which prevents strong air currents from striking the bulbs of the thermometer, but permits the diffusion of gas from the outside into the case.

It has been suggested to make this instrument automatic by replacing the colored liquid with mercury, which, ascending in the capillary tube, would close an electric circuit at a certain point or danger line. By this means, a small bell could be rung or an electric lamp made to glow and give the alarm of the presence of the gas.

A Visit to the British Experimental Station at Eskmeals

By Samuel Dean*

SYNOPSIS—The British Experimental Station accepts many of John Verner's conclusions, as published in these columns. There is an inrush of air, as well as an outrush probably throughout the duration of all explosive phenomena. The article states that narrow workings are more subject to explosions of coal dust than wide, and that the end of a blind heading is freer from that menace than a point along the rib.

A party left Blackpool by train for Fleetwood and sailed for Barrow on one of the most lovely days of an English summer. All stayed overnight in Barrow, and the rest of the party, not being interested in mining, I finished the last part of the journey alone, traveling up to Eskmeals around the edge of the Cumberland mountains, where Lakeland, the famous holiday resort, is situated, once the home of Wordsworth, Ruskin, DeQuincey and others.

The Experimental Galleries at the Eskmeals Station

The experimental station is not in an outlandish spot, being only 10 min. walk from the railway station. It is on the coast or west side of the railroad, located among sand hills. On the east side there are beautiful farms. The residents are accustomed to loud reports as Messrs. Vickers test their big guns along the shore. Sea fowl and game abound in the district.

The station is well equipped; there is excellent housing accommodation for the scientists, with well furnished offices, laboratories, etc. There are two tubes, one 800 ft. long, 7 ft. 6 in. in diameter, the other 400 ft. long and 3 ft. 3 in. in diameter. They are the same galleries that were used at Altofts by the Mining Association of Great Britain, have been taken over by the Home Office Department of the British Government.

Shale Dust of Value Where Gas Is Present

Recent efforts have been made to explode a one-to-one mixture of coal dust and shale dust in atmospheres containing 1, 2, 3, 4 and 4.5 per cent. of methane, and although I am not permitted to state the results at this time, I am glad to be able to say that the efficacy of shale dust as a preventive of explosions has been further proved, and that an explosion of firedamp alone is trifling compared with an explosion of coal dust.

As a special favor, Doctor Wheeler, who has charge of the station, prepared an experiment, which I had suggested, to prove or disprove the counter-current theory; and I may say at once that Mr. John Verner is quite correct. Mr. Verner's views may not be well understood, and on that account they are given here. He made numerous observations at close range, and this was what he found:*

When a shot is fired, say at the face of an entry, the air and what dust there may be present are driven away from the face by the expansive force of the heated and burning gases from the shot. This expelling force, however, is instantly checked apparently through the effects of a growing depression at the face, caused by the rapid cooling of the gases there and their consequent rapid shrinkage in volume. This depression is immediately filled by an inrush or backrush of air along the bottom toward the face, while the heated gases in the upper part of the entry keep on their course outby. The force and volume of the inrush of air along the bottom vary considerably in the different observations, the conditions in this respect being evidently determined by the size of the depression near the face. In view of this it might be rightly concluded that, if the inrush of air along the bottom is of sufficient volume, and carries with it sufficient dust, and if it reaches the heated gases near the face before they are cooled below the ignition point, then inflammation with explosive effects may take place.

The late Sir F. A. Abel's opinion was that a dust explosion was really made up of numerous distinct and local explosions which follow each other so quickly that the explosion may be considered continuous, and facts developed since he (Sir F. A. Abel) made his experiments and investigations show the correctness of his views in that respect. Sir Frederick further concluded that the same conditions which cause the explosive ignition of the dust in the first local explosion must be present to cause the explosive ignition of the dust in each subsequent local explosion. That being true, it follows that, if explosive inflammation is effected in the first local explosion by the injection of the air-and-dust mixture into the highly heated or burning gases, explosive inflammation must be caused in every subsequent local explosion in the same manner.

*Delagua, Colo.

*"Trans.," Inst. Mining Engineers, Vol. XLVI, Part 2.

The Open Ends of the Tubes

The Mouth of the 90-In. Tube

The question might be asked: Can the air inrush exist in the face of an explosion, and can it, against an apparently superior force, under seemingly extremely adverse conditions make sufficient headway, to produce the effects claimed? It seems difficult to believe, but nevertheless it has been shown that under favorable conditions the explosion of the shot and the starting of the air inrush may be practically simultaneous occurrences. In one of the Altofts experiments the presence of the air inrush was noted within a twentieth of a second after the explosive wave had passed a given point.

It might be difficult to establish by direct proof the presence of air inrushes during the progress of an explosion, but their existence can be established indirectly, and I believe that it can be readily shown by tests at Altofts, or at any other experimental mine or gallery, that the occurrence of a dust explosion is not probable if the conditions controlling the inrush of air are unfavorable.

Proving the Inrush Theory

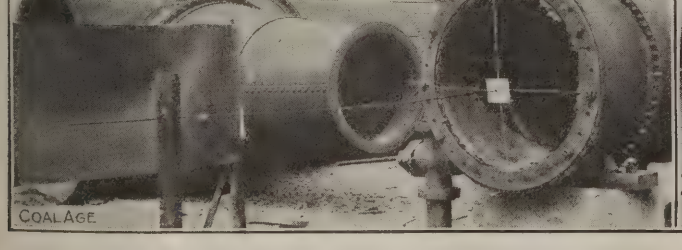
The experiment mentioned above was carried out in the small gallery 3 ft. 3 in. in diameter. A mixed dust was used containing 70 per cent. coal dust and 30 per cent. incombustible dust (fuller's earth); this was done to slow down the explosion and allow more time for observing the air actions at the mouth of the gallery. Across the mouth of the tube a board, 6 in. square, was supported by four coil springs, and from the board a rod 6 ft. long projected out into the open. There was a white mark on the rod, which passed through a stationary upright painted black. The rod moved back and forth as the air movements forced the board outward or inward. Half a pound per linear foot of mixed dust was strewn along the gallery to within 20 ft. of the mouth, and 1½ lb. of black powder, stemmed with 8 in. of dry clay, was fired from the cannon placed 50 ft. from the closed end of the gallery.

Diagram Showing Variations in Pressure during Explosion

The Board Is Sucked in and Blown Out of the Adit

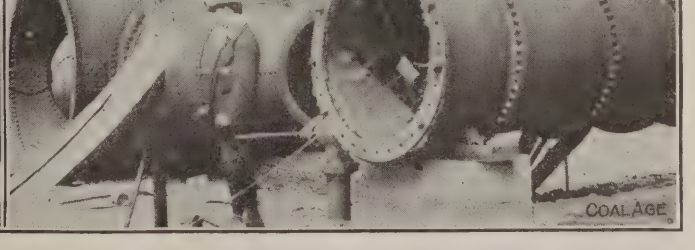
We observed the movements of the board and rod from a point 100 ft. from the mouth of the tube and nearly at right angles to it, being protected by curved iron plates containing small sight holes, with heavy wood ties and logs overhead.

A whistle was blown immediately before the shot was fired, and the first action we observed was a cloud of dust blown out of the mouth of the gallery. This was caused by what might be called the concussion wave from the cannon; there was no flame in this dust cloud. Then immediately there was an air inrush, then an outrush with little dust, then another inrush, then an outrush with flames, which appeared first at the top of the mouth of the tube. The final movement was an air inrush as the photograph shows. The second air inrush was very strong, accompanied by a loud sucking or whistling noise as the air rushed into the tube.



The movements were as follows:

Dust cloud.
Air inrush.
Outrush with little dust.
Strong air inrush.
Outrush with flame.
Inrush.



It will be noted that we were able to count two inrushes before the flame appeared, and in a longer gallery there would doubtless be many more.

No originality is claimed for this test. Doctor Wheeler could tell me exactly what would take place before the shot was fired. His pressure diagrams from violent explosions show the pulsations clearly.

It appears that during an explosion the pressures in front rise and fall in an alternating manner. The peaks of the diagrams show when the obstructing pressure is

A Small Board Supported by Springs and a Painted Rod Showed the Movements of the Air

As Is Clearly Shown, the Last Movement Was an Inrush, Drawing Board and Rod into Tube

greatest and the fall is probably caused by air rushing under the advancing explosion wave to fill the partial vacuum behind. Thin sticks of "cordite" are used to indicate the position and length of flame in explosions; this ignites easily and burns slowly.

Face Shots Least Dangerous

It has been found at Eskmeals to be extremely difficult if not impossible to start a dust explosion from a shot fired from the face or closed end of the gallery, and to assure success the shots are fired 50 ft. from the closed end. It is also much easier to start a dust explosion in a small than a large area, showing that probably the most dangerous shots fired in coal mines are those in narrow crosscuts back from the face, and, of course, shots on main haulage roads which ought not to be permitted without special precautionary measures, such as heavy shale dusting for 100 ft. each side of the shot.

The flame from a blown-out shot of 1½ lb. of black powder is 14 ft. long, and 5 lb. of coal dust placed in front of the shot increases the length of the flame to 140 feet.

Where shale dusting is relied upon, it is well to have as fine dust as possible. All should pass through a lamp-gauze mesh, and 50 per cent. through a 200-mesh sieve (200 perforations to the linear inch).

Extracts from a Superintendent's Diary

Generally our young men get "trimmed" when they match wits with the City fellows, but today some of our boys reversed the order of things.

For several days a glib-tongued young man has been sojourning in our camp introducing a new form of accident policy, designed especially (so he says) for the mining fraternity.

Before being sent out on this public-spirited mission, he was coached by the general agent of his company and now he has a set speech which he rattles off at every opportunity. The general agent undoubtedly received his information about the hazards of mining from the Sunday Supplements. At any rate, this pupil assures every miner he meets that probably tomorrow or the day after he can count on being blown into at least a thousand pieces. And the inhabitants of the camp who are fortunate enough to be able to earn their living above ground are in quite as much danger because no one can foretell the moment the entire village is to be swallowed up by a mine cave.

The first miner who encountered the agent was so amused at the "spiel" that he refused to ridicule it, but instead called all of his "buddies" within hearing distance to come and get information. Naturally there were a few points that the solicitor felt rather doubtful about, and whenever he intimated that he was willing to be educated, his audience proceeded to hand out information, much of which was of a character calculated to make even the creator of the Sunday Supplement stories envious.

One thing led to another until finally a trip into the mine was suggested to enable Mr. Agent to complete his education. Some of the men assumed that the Super's sense of humor would not allow him to interfere when permission was requested to make the trip and in that they were not disappointed. In fact the Super. found himself at the manway entrance this afternoon impatiently waiting.

The Insurance Agent Takes a Trip Underground

All the way down the manway the bewildered agent's guides supplemented the impressions which he had received from his general boss by new facts, which became purposely more terrifying as the distance from the mine mouth increased, until at last, as the bottom of the slope was reached, the wretched fellow was about of a notion to turn back. This being exactly the state of mind required to make a success of the plot, the final maneuvers were not long delayed.

Just as the party turned into the first abandoned entry off the main slope, two men hiding in one of its room necks knocked out a prop under a rather large piece of drawslate and it fell with a loud boom.

Because of the fact that I had exacted a promise from the men that the fellow should not be permanently disfigured, they did not let him run far in the darkness, but he ran far enough to get bumps on all four sides of his head and one of his eyes won't behold daylight for several weeks at least.

As he was led past me at the manway entrance on his way out, he was hardly recognizable. Even his lips were unnatural, probably because of the mine water they encountered when he stumbled into one of the small pump sumps.

I rather imagine he will shift avocations when he recovers.

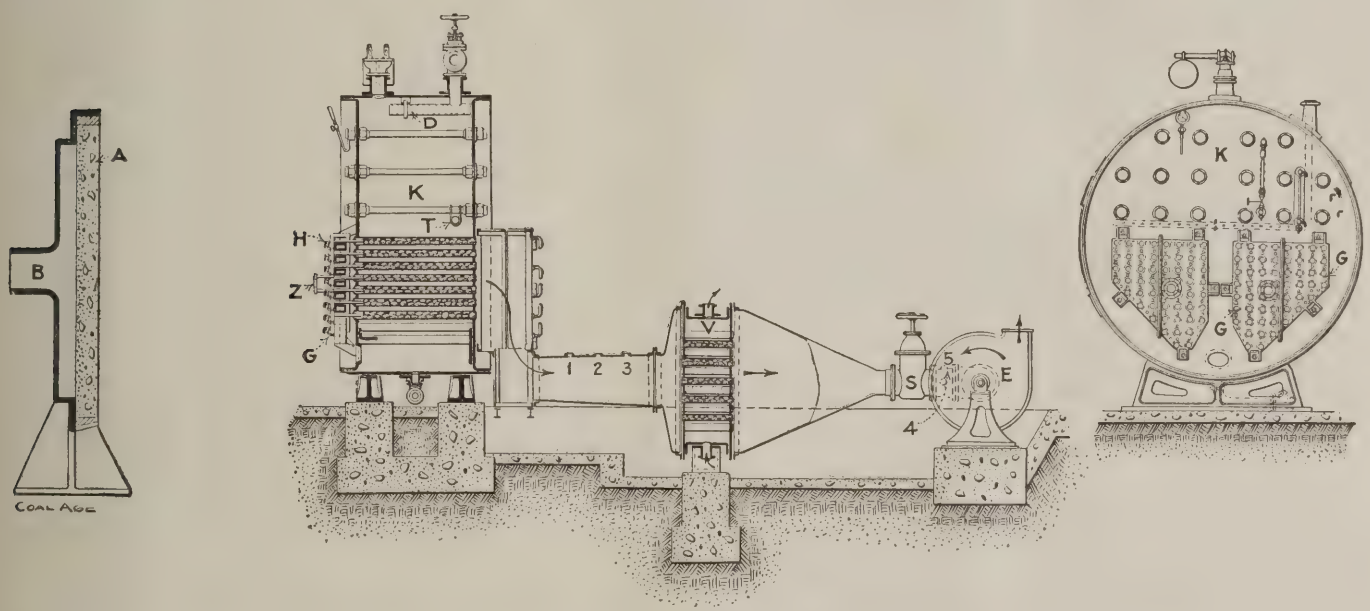
Uncompressed Oxygen

The difficulty in using oxygen in the compressed state is that it must be kept charged in heavy cylinders. Instead of using strong mechanical containers, chemical constraint can be substituted. Thus oxone is a substance in which oxygen is held in chemical bonds, but is releasable by the application of water. Just as water reacts with calcium carbide and forms acetylene gas and lime, so water reacts with oxone and forms oxygen and sodium hydrate.

A pound of this reagent holds 2.2 cu.ft. of gas or 60 liters of oxygen at normal pressure and temperature. Thus a pound of oxone should furnish a man enough oxygen for 30 min. of use. The oxygen evolved is said to be 99 to 100 per cent. pure, the only impurity consisting of a slight vapor caused by the energy of reaction. This is readily absorbed by passing the gas through water. The gas is then of 100 per cent. purity.

Oxone is a commercial preparation of fused sodium peroxide of specific gravity 2.43. It is hard, but not brittle, and is capable of being cast into any convenient shape, and it is said it can be stored without danger and even without deterioration if protected from moisture.

The list price of this reagent as sold by the Roessler & Hasslacher Chemical Co., 100 William St., New York, is 45c. per lb. in 10-lb. tins.



There are two unions in Germany, one socialist, the other Christian. The latter refused to order a strike in the last two big walkouts, when all the other men refused to work. The number of men in the Christian Miners' Union has fallen from 84,384 to 63,192 in the last two years. During the recent German strikes, the militia had to be called in to protect the strike-breakers and the "Christian" union men.

Flameless Surface Combustion for Boiler Heating

By O. Dobbelstein*

SYNOPSIS—Tests of a boiler designed for flameless combustion by Prof. Bone developed an average efficiency of 89 per cent. and an evaporation of 120 lb. of water per 10 sq.ft. of heating surface, the combustible employed being coke-oven gas. An experimental boiler for the combustion of tar oil developed an average efficiency of 82 per cent., with an evaporation of 240 lb. water per 10 sq.ft. of heating surface.

A discovery made, simultaneously, by Prof. W. Bone, of Leeds, England, and R. Schnabel, of Berlin, Germany, is that a mass of porous fire clay, or other refractory material, through which is passed a burning mixture of gas and air, the latter in slight excess of the amount necessary for complete combustion, soon becomes heated to incandescence, without the appearance of a flame.

Figs. 1, 2 and 3. Details of the First Experimental Boiler

In Fig. 1, *A* represents the refractory material and *B* the gas chamber for mixing the gas and air, in the correct proportions. This mixture is forced through a diaphragm, rendering the fireclay white hot, but with no flame on the surface. The combustion is concentrated in the interstices of the fireclay and is most intense at the exterior surface.

So far as the coal-mining industry is concerned, the chief interest in this discovery would seem to lie in its application to steam generation; and, with this in view, an experimental plant was constructed by the Friedrich Krupp Co., of Essen (Germany), under instructions furnished by Prof. Bone. Tests were conducted at the Hanover mine, with the assistance of the Mine Boiler Inspection Co. of Dortmund.

The boiler is shown in cross-section in Fig. 2, Fig. 3 being a front elevation. The design was that of a drum, 120 in. in diameter by 49 in. long, in which are 110 three-in. diam. tubes. In the front end of each tube is a plug of fireclay pierced by a ½-in. hole beyond which the tube is filled with refractory material.

The burnt gas, after leaving the boiler, goes through a feed-water heater provided with 103 tubes, which, also, are filled with refractory material. From the heater, the gas is drawn through an exhaust fan.

In operation, a mixture of gas and air is drawn through the boiler tubes, air being added until the flame disappears in the mass of fireclay and the latter becomes white hot. The plug protects the end of the tube, as the temperature reaches 1600° C. (2900° F.) just beyond it.

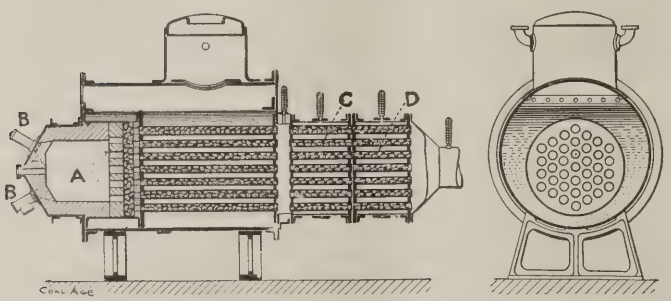
The temperature in the tube is very uneven, 70 per cent of the evaporation taking place in the first third of its length, 22 per cent. in the next third and 8 per cent., only, in the remainder. The circulation is consequently brisk. The exhaust gas leaves the boiler at a temperature of 330° to 350° F. and the feed-water heater at 200° to 230° F.

During test, the boiler was heated by the gases from the coke ovens, which had already passed through the apparatus for extracting ammonia, tar and benzol, but had not been freed from either sulphuretted hydrogen or cyanogen.

The Refractory Material Crumbled

After being in operation about three weeks, it appeared that the fire-resisting material in the tubes had crumbled or turned to cinders due to the high temperature. Moreover, the duty had fallen off perceptibly from the original amount of 120 lb. per 10 sq.ft. of heating surface at 115 lb. pressure because the granular mass in the tubes of the water heater had become sticky from leaking water and

*Essen, Westphalia.
Note—Translated and abstracted from Glückauf, of Apr. 4, 1914, by Henry B. Binsse.



sulphur compounds, so that the exhaust fan was no longer able to draw gas enough through the steam-heating tubes.

The refractory material was renewed in both the boiler and heater and, again, the boiler worked for several days at the original efficiency. The English engineer representing Prof. Bone was dissatisfied with the tests, in which the efficiency ranged from 87 to 91 per cent., the refractory material being poor and the gas cocks too small.

Although this performance, especially the evaporation per square foot of heating surface, showed a great falling away from the published claims, still it marked a distinct step in advance in comparison with other steam-generating methods, if the process could be relied upon for steady working. Unfortunately, this had not been possible, so far. After a few weeks the tubes in the heater again became stopped up and the run was discontinued.

Another Set of Tests Were Made

In February, 1914, the trial was renewed, after an external examination of both the boiler and the heater. It was found that there was a slight scale formation upon the front end of the tubes which increased to a thickness of ⅛ in. on the rear end. The boiler had been under steam for about three months, in all. The copper

Figs. 4 and 5.—Cross-Section and End View of Second Boiler

tubes of the heater were so corroded that they had to be replaced.

At the second trial, the tubes were filled with a coarser-grained material. The results of this run demonstrated that a higher evaporation duty than 125 lb. per 10 sq.ft. of heating surface at 115 lb. pressure could not be obtained from the coke gas used and from tubes of small diameter. The boiler efficiency was 88.3 per cent.

The February trial further demonstrated that the refractory material employed was not able to meet the exactions demanded and that the boiler construction employing small-diameter tubes is not the most advantageous. It is proposed to make further experiments with an improved design of boiler.

Surface Combustion with Oil Fuel

Another trial was made by the Friedrich Krupp Co. of a boiler furnished by the Berlin-Anhalt Machine Co. for the consumption of tar oil. The construction is clearly shown in the cross-sections, Fig. 4 and Fig. 5. The dimensions are 51 in. in diameter by 67 in. long, with 37 three-in. tubes, while the total heating surface is 130 sq.ft. Two feedwater heaters, *C* and *D*, are attached directly to the rear end of the boiler.

The oil, heated to 200° F., flows into the combustion chamber *A*, through the oil burners *B*, being vaporized by a blower.

Three tests were conducted by Mr. Dobbelstein, and the engineer of the Dortmund Boiler Inspection Co. At the second test, a duty of 240 lb. steam per 10 sq.ft. of heating surface was obtained, at a steam pressure of 147 lb.

The test was abandoned after a run of 7 hr. on account of the destruction of the lining of the combustion chamber. At the third trial, on Jan. 9, the duty rose to 243 lb. of water per 10 sq.ft. of heating surface, at the same steam pressure as before. In all three tests the efficiency of the plant averaged 82 per cent.

These experiments have proved that with surface combustion of tar oil, a duty of about 24 lb. evaporation per square foot of heating surface can be obtained, although it may be questioned whether this design of boiler can long withstand being driven to this extent. The Berlin-Anhalt Machine Co. has under construction an improved design of boiler with which further tests will be made and which, it may be expected, will overcome the practical difficulties encountered with the first boiler.

An Increase of Coal in Iowa

The production of coal in Iowa in 1913, according to E. W. Parker, of the U. S. Geological Survey, was 7,490,641 short tons, valued at $13,431,061. This was an increase over 1912 of 201,112 tons in quantity, and $278,973 in value.

Operators complain of the unsatisfactory character of the mine labor of the state, not so much on account of inefficiency as of exacting demands, which they claim have increased the cost of production beyond the price which may be realized for the product. This has discouraged the opening and development of new properties.

Iowa is primarily an agricultural commonwealth, and the markets for its coal, outside of what is taken by the railroads, are chiefly in rural communities and cities of moderate size, dependent upon agricultural trade. There are no extensive manufacturing interests requiring large supplies of fuel for the generation of power.

Some coal is shipped from Iowa to Nebraska, Minnesota and other states, but an equal amount is imported from Illinois and Eastern fields. The coal beds of Iowa are thin, the thickest in the Des Moines district averaging about 5 ft. They are also somewhat irregular and faulty. The coal is of a noncoking bituminous grade somewhat high in sulphur, but making a fair steaming fuel.

The number of men employed in the mines decreased from 16,370 in 1912 to 15,679 in 1913. Consequently there was an increase in the average yearly production per man from 445 tons to 478 tons.

Iowa is no exception to the other states in the interior where shooting of coal from the solid is practiced to a reprehensible degree, and the record in that respect for 1913 was worse than in 1912. The quantity of coal shot off the solid in 1913 was 5,405,142 short tons, or 72 per cent. of the total production.

There were 26 fatal accidents in the coal mines during the year, an increase of 7 over 1912. All the fatalities occurred underground, and 18 were due to falls of roof.

The Labor Situation

SYNOPSIS—No important developments during the week in any of the states except Kansas and Missouri. A bill is introduced into the federal House of Representatives to prevent the transportation of strike-breakers from state to state. The Montana Workmen's Compensation Bill is arousing some opposition.

The labor situation in the coal fields of Ohio changed but little during the past week. A large majority of the mines in the Hocking Valley and Jackson fields are in operation and others are being placed in shape for work. It is believed that practically the full capacity of the mines in those districts will soon be reached. In the Crooksville district some coal is being produced and other mines are being put in condition for operation.

The working conditions in the Massillon field are practically settled, and all but two mines are being operated. The Massillon Coal Mining Co., of Massillon, Ohio, has signed the scale and will start operations at Navarre, Stanwood and Dalton. This company has also three new mines which it is announced will be opened in the near future. Fifteen hundred men are involved in this settlement. In the Tuscarawas field, the working conditions were finally settled in a compromise and these mines will soon be active. The Cambridge district is working and a considerable tonnage is being produced in that field.

THE POMEROY BEND FIELD STILL NOT WHOLLY SETTLED

Over half the Pomeroy field is still idle. W. W. Miller, of the Pittsburgh Mining Co., writes us as follows: "The only mines which have reached a settlement are those which produce whole-vein coal, mining the clean coal, top coal and horn coal. The oldest shippers in the district mine their coal under the horn, and these mines are still without a settlement, as the miners are demanding a differential of 4c. per ton above the mine-run rate as agreed upon in the state agreement at Columbus."

EASTERN OHIO STILL IDLE

So far no efforts have been made in eastern Ohio to bring about another conference of the scale committee of the operators and miners. A report was current that the miners were about to take a referendum vote on the proposition of accepting or rejecting the offer of the operators for 99c. for lump and 2c. for slack, or the 41.12c. scale. But this is denied by those who are in a position to know.

It is stated that President C. J. Albasin, of subdistrict No. 5 of the United Mine Workers of America, will go to Indianapolis, Ind., and make an appeal to the International Executive Board of the Union, asking that all the mines in Pennsylvania and West Virginia now operated by mine owners who have mines in Ohio where strikes are in force be closed by the union. Such an action in districts having contracts with the organization would be in violation of the agreements signed; in others it would be beyond the power of the union; so it is hardly likely that the petition will be heeded at the union headquarters.

A READING DISPUTE

The general grievance boards of all the Philadelphia & Reading Coal & Iron Co.'s collieries in the Northumberland County district, employing about 5000 men and boys, notified the officials of the United Mine Workers of America to order all the Reading men in the district to go on strike on the 17th unless the grievances at the Alaska colliery were settled by Saturday, the 15th. The employees at the colliery in question had refused to report as required at a certain point morning and evening. Such a strike would be a violation of the agreement. All disputes must be settled by the Conciliation Board without a strike of the miners. We are glad to hear that the men finally decided to keep their bargain and remain at work though the Alaska mine is idle in violation of the agreement.

CENTRAL PENNSYLVANIA

The central Pennsylvania district, No. 2, is peculiar in that it has no subdistricts. In 1900, nine subdistricts were created, but in 1906, by a vote of delegates in a convention in Du Bois, Penn., these were abolished. There is a strong sentiment against this abolition and recently an unofficial convention of protest was held at Altoona and the delegates, protesting that the action in 1906 was ultra vires, desire the International Executive Board to declare the result of that vote null and void.

The Miller Coal Co., of Portage, Penn., has sued the local union at that place, No. 570, for $5000 damages. It is alleged that when the company refused to accept a certain checkweighman elected by the men, the Union spread defamatory and damaging reports in circulars and letters, and the company lost much business as a result.

WEST VIRGINIA

It was expected that the men of the Four States Coal Co., at Dorothy, W. Va., would go on strike on Saturday, the 15th, but they did not. Approximately, 500 men are employed. The rate paid is 26c. for machine coal and 31c. for pick coal. The miners want 32½c. for machine-room coal, 37c. for machine-entry coal, and 56½c. for pick-mined coal, which are the Kanawha scale prices for work in the Coalburg seam. The Four States Coal Co. is not a member of the Kanawha Coal Operators' Association, and the union is making every endeavor to bring its scale up to that of mines nearby.

Twelve hundred men employed by the Boomer Coal Co. went on strike following the discharge of Fletcher Norman, a colored machine man. The company alleged that Norman had broken the rules and dispensed with his services. The case is taking the regular course prescribed by the agreement, and the strike is therefore in plain violation of the union rules.

At Marting, W. Va., near the Kanawha and Michigan station, F. Littleton, of Charleston, and R. L. Sprouse, of Glasgow, were assaulted by strikers with pick handles. The men were employed by the Columbia Iron & Steel Co., and had refused to join the union. After the men had been beaten up, the strikers went back to work.

THE SOUTHWESTERN AGREEMENT

On Aug. 15, an agreement was reached between the miners and operators in the state of Kansas and in Vernon and Bates Counties, in Missouri. Other joint committees of the operators in Missouri, Arkansas and Oklahoma, also in session, did not succeed in making agreements.

A bill has been presented by John W. Evans, of Montana, to the House of Representatives which will stop the passage of strike-breakers from state to state. Senator Martine has presented a similar bill to the Senate. The measure puts the burden of holding strike breakers in their respective states on the railroads and steamships. A citizen getting or buying a ticket will be subject to inquiry from the ticket seller as to whether he is a strike-breaker. The law does not require that the railroad shall knowingly offend in order to come under its provisions. Note that it says merely that "it shall be unlawful . . . to carry or transport . . . strike-breakers." This bill, we are told, follows a brief submitted to Congress by E. P. Costigan, Horace N. Hawkins and James H. Brewster, attorneys for the United Mine Workers, and further, it is in accord with the views of the present administration, which is also probable, seeing its origin.

BILL PROHIBITING IMPORTATION OF STRIKE-BREAKERS

The bill reads as follows: "A bill to prevent the transportation by interstate carriers of certain persons and articles for the alleged prevention of so called labor troubles.

"Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that from and after the passage of this act, it shall be unlawful for any railroad, railway, steamship company, person or association or any other common carrier engaged in interstate business to carry or transport into any state or territory any men hired, employed or engaged as strike-breakers, so called, for the purpose of assisting in or interfering with any labor trouble or strike.

"Sect. 2. That it shall also be unlawful for any railway, railroad, steamship or other company, person or association engaged in interstate business to transport, handle or carry any firearms or ammunition into any state or territory for the purpose of assisting in arming or equipping such so called strike-breakers.

"Sect. 3. That a violation of this act by any railroad, railway, steamship or other company, person or association engaged in interstate business as a common carrier shall be punished by a fine not exceeding $1000 and imprisonment not exceeding one year, said fine and imprisonment to be imposed on the president, manager or other officer, agent or employee of the said interstate carrier who may be found guilty of a violation hereof.

"Sect. 4. That this act shall not apply to the organized militia of any state or territory, the officers or men of the United States army, or to any duly organized and uniformed police force or constabulary having jurisdiction of the territory embraced within such labor trouble or strike."

MONTANA COMPENSATION BILL

In Montana, the employers have formed an organization to oppose the passage of a workmen's compensation act. Just what form this opposition will take is not clear, but let us hope that the objection is not to all forms of compulsory compensation, but to certain specific provisions in the bill. Oscar Rohn, of Butte; W. B. Rodgers, of Anaconda, and J. E. Woodard, of Roundup, together form the "Committee on Metal and Coal Mining and Ores."

It is alleged by H. G. Miller, of Kalispell, that wages are already 25 per cent. higher in Montana than in Washington. Hence the compensation based on the same percentage would also be higher. It is also stated the rates of assessment are 100 per cent. higher than in Washington. Of course, this is not so important, as they would be adjusted if too high, but the liabilities for total temporary disabilities are 50 per cent. higher than in Washington state, for permanent partial disabilities 70 per cent., for total permanent disabilities 50 per cent., and for fatal accidents 50 per cent.

Moreover, in the state of Washington, 40 per cent. of all cases involved time losses of not more than 12 days. In that state, if an employee were disabled for three weeks the claims would be settled for $21. In Montana, he would receive $32 of insurance, $22.50 in cash, and in addition the hospital fees for bed and board, which would make more than the employee would receive if working. In Washington, it has been necessary to amend the law and to provide that benefits could not be paid for the first two weeks. It is likely that Montana will need some such provision.

COMPENSATION OF SALARIED OFFICIALS

In West Virginia, A. W. Calloway, of the Davis Coal & Coke Co., announces that the company will insure the lives of all those in its employ who would otherwise not receive benefits under the compensation law without any expense to them. The company will pay the beneficiary one year's salary in monthly instalments on the death of such an employee, provided he has worked for the company for a whole year. If he has worked less than a year for the Davis Coal & Coke Co., payment to the beneficiary will be equal to six months' salary.

Recent Machines for Loading and Quenching Coke*

Those who are interested in the loading and quenching of coke will find in the contribution of Mr. A. Thau, M.E., to Gluckauf, for Feb. 28, and Mar. 7, a lengthy review of the development in this branch of the industry since 1911. The writer states in conclusion that most of this work is no longer of English but of German origin; and, moreover, that German firms have greatly improved upon previous English machines.

This would seem to be one of the factors in the extremely rapid growth of German coal and coke exportation, which has nearly overtaken that of Great Britain. To appreciate how important this is, we should bear in mind that these products form about one-tenth of all the exports from the United Kingdom.

Mr. Thau divides the machinery into three classes: loading machines for horizontal or inclined, elevated or depressed platforms, quenching machines, which deliver the coke to a separator without the use of a platform and combined quenching and loading systems.

Figs. 1 and 2 show the construction of an English machine, which easily handles the output of 100 ovens. It consists of an endless elevating chain, carried by a substantial iron framework, resting on three pairs of truck wheels.

Details of Operations

The coke from the inclined platform is directed onto the guide *d*, by which it is delivered to the level part of the chain, and carried up the incline *e* over a screen, beneath which is a bunker *f*. On reaching the top, the screened coke falls into the chute *g;* and passes thence into the car. The driving mechanism and platforms are clearly indicated. Fig. 3 shows the chain cross-section.

In Fig. 4 we have a German machine built for a Belgian company to load 500 tons daily. The coke falls from the inclined platform *a* into the bucket *g*. It is hoisted by block and falls to the topmost position, as shown. Here it is dumped into the chute *p*, and passes over a shaking screen *k*.

The frame is carried on double rails at *e*, and a single rail at *d*. The driving motor and mechanism are just beneath the roof. There are two other motors just below, one to shake the screen and one to move the apparatus along the track. The chute *q* catches the ashes and small coke and delivers them into a bunker or a car.

A Combined Quenching and Loading Machine

The third example, Fig. 5, is a combined quenching and loading machine, built by the Berlin-Anhalt Machine Co., Ltd. The coke is delivered into the tubs *b*,

*Abstracted from the German by H. B. Binsse, Short Hills, N. J.

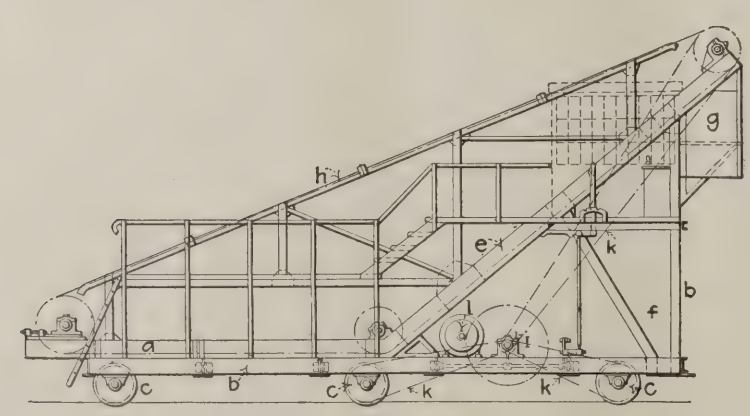


FIG 1

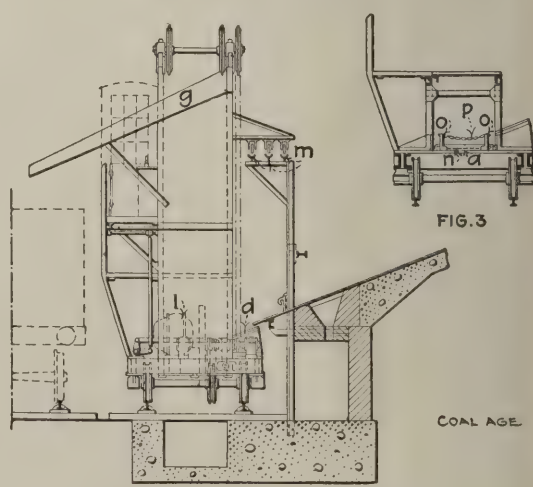

FIG.2

FIG.3

Figs. 1, 2 and 3. Side View and Cross-Sections of an English Coke-Loading Machine

under which is a water tank *a*, into which the tub sinks from the added weight of the coke, thus cooling the walls of the tub and finally opening a valve in the bottom. The water now enters, and turns into steam, which not too rapidly cools or quenches the contents.

This makes the best appearing and hardest coke. The tub is then elevated to the upper position, as shown, the water draining back into the tank through a sieve. The coke is unloaded from the tub into the bunker *i*, from which it is discharged onto the endless chain k, which acts also as a screen, allowing the finer pieces to fall through and to be dumped into the car *n*. The good coke is carried along by the chain and falls into the other car. One man operates the entire machine.

Mr. Thau's paper describes a suprising variety of machines designed for this purpose, showing the great attention Germany is now paying to labor-saving appliances.

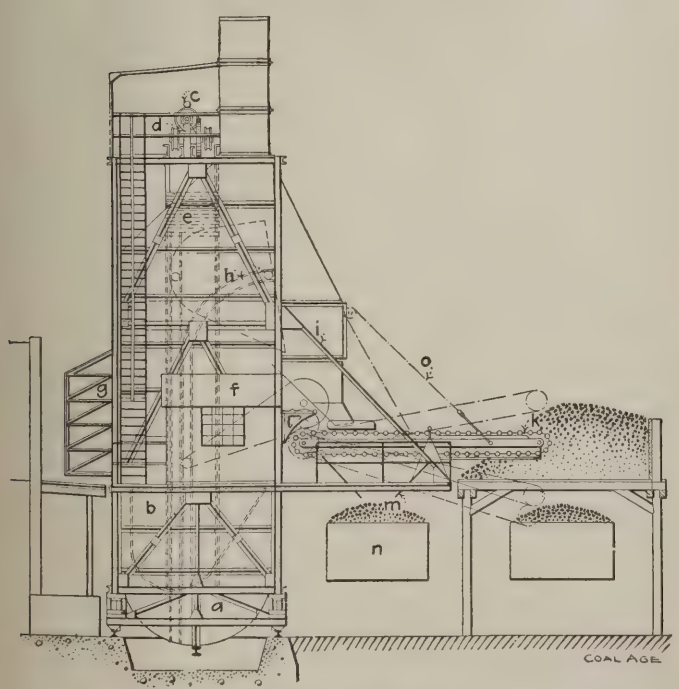

FIG. 5. A COKE-QUENCHING, ELEVATING, SCREENING AND LOADING MACHINE

Oklahoma Breaks Her Coal Record

During the year 1913, coal was mined in Oklahoma to the amount of 4,165,770 short tons, valued at $8,542,748, according to figures compiled by E. W. Parker, of the U. S. Geological Survey, in coöperation with the Geological Survey of Oklahoma.

Oklahoma more than any other of the coal-producing states in the Mississippi Valley and the Rocky Mountain region, was benefited by the labor troubles in Colorado, as is shown by the increase in production over 1912, amounting to 490,352 tons, or 13.34 per cent. The value of the product increased $675,417, or 8.6 per cent. The smaller relative gain in value in 1913 was due to the fact that in that year prices were somewhat inflated because of the rather abrupt withdrawal of fuel oil from the market, where it had been in competition with Oklahoma coal, and to a diminution in the supply of natural gas from the northern part of the mid-continent field, particularly in Kansas.

The deficiency in the Kansas production of natural gas is being made up, however, by development in Oklahoma, and the result as well as the fact that the supply of coal is catching up with the demand on account of the increased production of 1913, is exhibited in the return to lower prices, the average value per ton in 1913 being the same as in 1911. The total number of men on strike in Oklahoma in 1913 was 1696; the average time lost by each man being 80 days.

Oklahoma continues to show a high percentage of coal shot off the solid, a practice encouraged by the laws which compel the payment of wages on the basis of mine-run coal.

The number of days the men were able to work in 1913 shows a marked improvement over the two preceding years, and if no time had been lost by strikes, the average number of days worked would have exceeded 200 by a considerable margin. As it was the average time made by the 9044 men employed was 197 days, compared with 8785 men for 174 days in 1912. The average total production for a man in 1913, was 461 tons.

The fatality record of Oklahoma in 1913, according to the Bureau of Mines, shows a decided improvement over 1912, when, owing to an explosion of gas and dust in the San Bois mine, at McCutcheon, the death roll was high. In that one explosion the lives lost amounted to more than three times the total number of deaths in 1913, when 23 fatal accidents occurred.

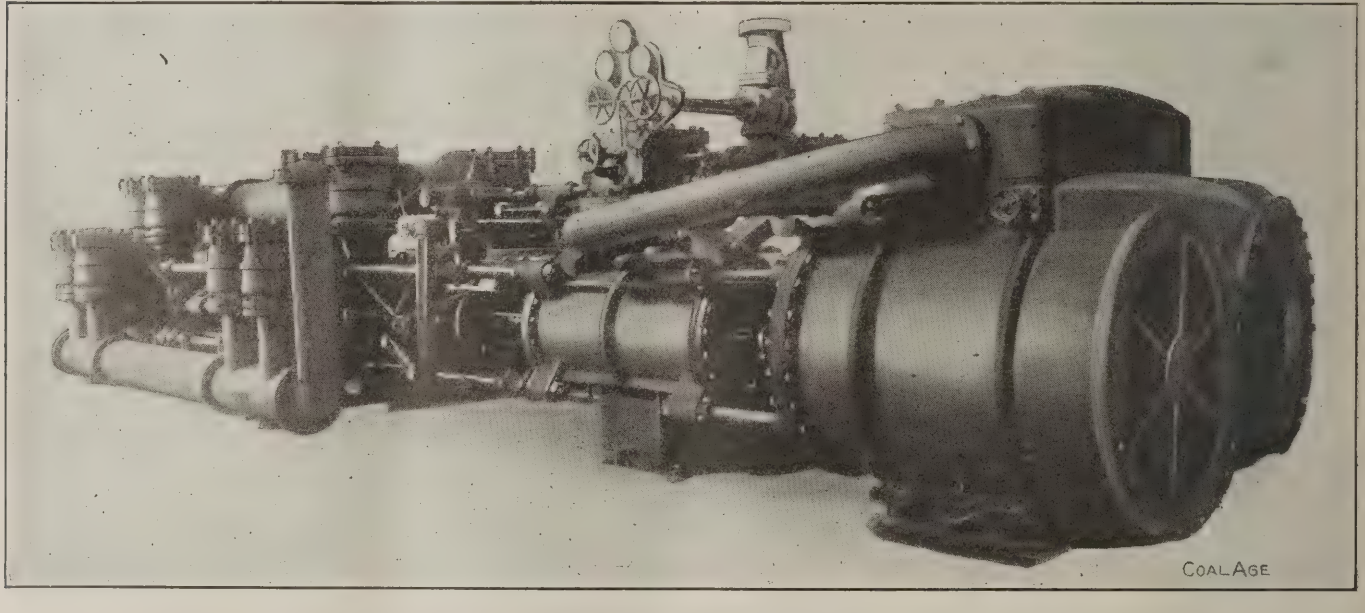
Experience has shown that it is not wise to use one cylinder of a Draeger apparatus for the outward trip while holding the other in reserve for the return. It is safer to depend wholly upon the pressure gage and use only one valve, as the wearer may run over time with one cylinder and be overcome by lack of oxygen, without the preliminary warning of dizziness, and fall unconscious while he still has a full cylinder.

A Large Steam-Pump Installation

SYNOPSIS—Two compound steam pumps, weighing 75 tons each, are being installed in an underground pump room of an anthracite colliery. Each pump normally handles 3000 gal. per minute against a 600-ft. vertical head.

In the operation of mine pumps, efficiency is desirable but reliability is necessary. In many cases the operation of the pumps is of secondary importance only to that of the fan, for should the former cease running the pit would soon be flooded. For this reason, in order to be successful, such machines must not only be of sufficient size and capacity to handle the amount of water made by the workings, but must be so constructed as to render repairs and replacements both quick and easy, securing meanwhile as great efficiency as is consistent with reason.

In the Packer No. 4 Colliery of the Lehigh Valley Coal Co., at Lost Creek, near Shenandoah, Penn., there are being installed two Goyne, compound, duplex, steam, plunger pumps of a normal capacity of 3000 gal. per minute each against a vertical head of 600 ft. The high- and low-pressure cylinders of these machines are 25 in. and 44 in. in diameter, respectively, the diameter of the plungers is 15 in. and the stroke is 4 ft. The suctions are double, that is, composed of two 14-in. pipes, one upon either side. The discharge pipe is single, 15 in. in diameter. The steam and exhaust pipes are 7 in. and 10 in. in diameter, respectively.



These pumps, which are 41 ft. 5 in. long over all and weigh 75 tons each, are being placed in a pump room cut out of the solid rock and provided with a traveling crane. The high-pressure cylinders are equipped with Goyne patented adjustable cut-off valves, which may be adjusted while the pump is in operation.

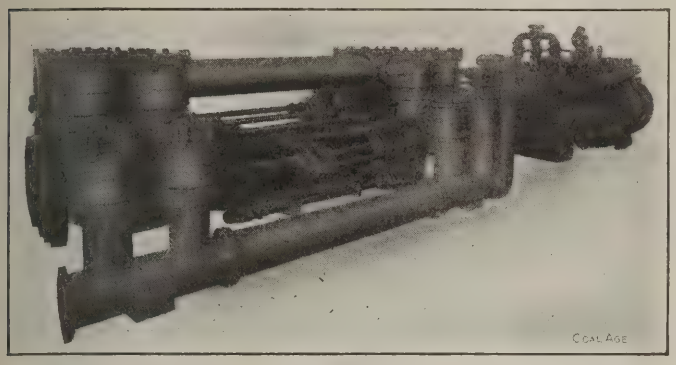
This cut-off device consists of two elements. The primary valve works upon a seat in the ordinary manner with a travel parallel to that of the pistons. The secondary valve is double, rides upon and is carried forward and backward with the primary valve, but has, meanwhile, a transverse travel across it.

The function of this secondary or cut-off valve is exactly analogous to that of the well known Meyer riding valve. Since in a pump the piston movement is not uniform in length, a rider with a travel in the same direction as that of the primary valve, upon which it seats, would not be applicable. This difficulty is, however, entirely overcome by causing the two valves to move at right angles to each other.

A compound pump provided with this cutoff has, on test, shown a saving of 8 per cent. on an indicated horsepower basis. On simple pumps the saving is, of course, greater.

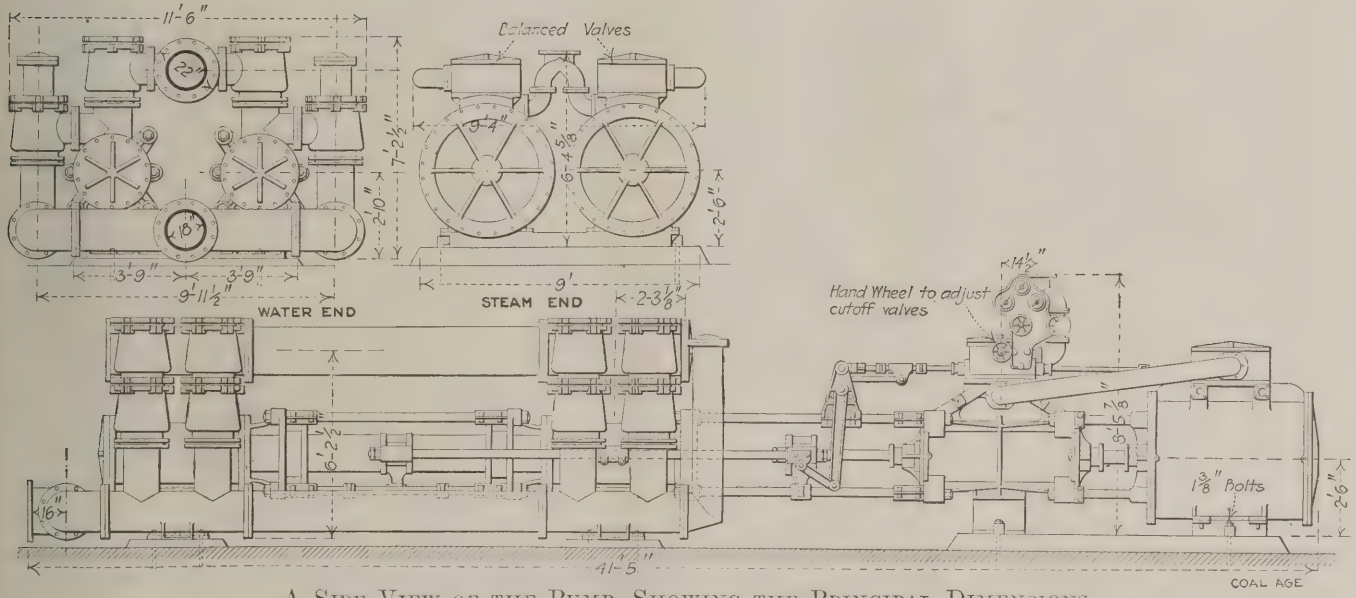
Positive lubrication of cylinders is secured by power-driven oil pumps, and each machine is provided with steam, vacuum and water-pressure gages, as well as a stroke counter. The steam cylinders are not bolted fast in position, but the stand feet are free to move in machined guides, thus making provision for expansion and contraction.

A Photograph Showing the Steam End Particularly



Cross exhaust is made between high- and low-pressure cylinders, the latter being provided with balanced valves. A live-steam connection is also made to the low-pressure cylinders, which permits operation of the pumps at full capacity should the steam pressure, which is normally carried at about 100 lb. at the boilers, fall appreciably. Final exhaust is made to a 12x18x18-in. Goyne, single, special jet condenser.

The water end of the pump is lined throughout with wood, bronze and composition. It is fitted with 16 valve chambers, each provided with a Goyne, hood-type, leather valve operating on a bronze seat. The plungers are outside connected center packed.



As may be seen in the accompanying drawing, each plunger is provided with a crosshead fitted with an ad-

justable wearing shoe working on a guide. The plunger's weight is, therefore, taken by the guide and not upon the packing in the stuffing-boxes.

The working barrels are connected by heavy steel tie-rods fitted with removable clamp collars to facilitate repairs or the renewal of parts. The same construction is followed in joining the steam cylinders to each other, and to the water end of the machine. This renders it possible to make many repairs quickly and with extreme

PHOTOGRAPH SHOWING THE WATER END OF THE PUMP

A SIDE VIEW OF THE PUMP, SHOWING THE PRINCIPAL DIMENSIONS

ease. For instance, the packing rings upon any piston may be renewed without removing the piston from the rod or entirely from the cylinder in which it works.

While, as stated in the beginning, a mine pump must primarily be reliable, economy is nevertheless important. Mine pumps are usually operated continuously day and night, so that even a slight lessening of the steam consumption per horsepower-hour amounts to a considerable quantity at the end of the mouth. While in the nature of things the saving secured through the use of the riding cutoff valve above described, is not as great in a compound as in a simple pump, yet this saving is like interest on money—it keeps on working day and night, Sundays and holidays, throughout the entire life of the installation.

The requirements as to the reversal of the air current are being met at some mines in England by the construction of additional fan drifts, and the erection of doors to be opened or closed as the case requires.

A Promising Thermopile

SPECIAL CORRESPONDENCE

An invention on which a German engineer, Johannes Marschall, of Dresden, has been working for some years past, holds out the prospect that domestic electric light may some day be obtained without the intervention of a central power station, by means of an apparatus which will merely require to be supplied with coal like an ordinary stove.

The fact that electricity is generated when the junctions of different metals are kept at different temperatures was noticed by Seebeck nearly a century ago, and many efforts have since been made to utilize the phenomenon on a practical scale, the thermopiles of Clamond and Hauck being examples. But various technical and manufacturing difficulties have been encountered. The current obtained being at best very weak, large numbers of elements must be combined in order to yield any serviceable effect, and alloys which gave a reasonably high electromotive force had the objection that their electrical resistance was also high.

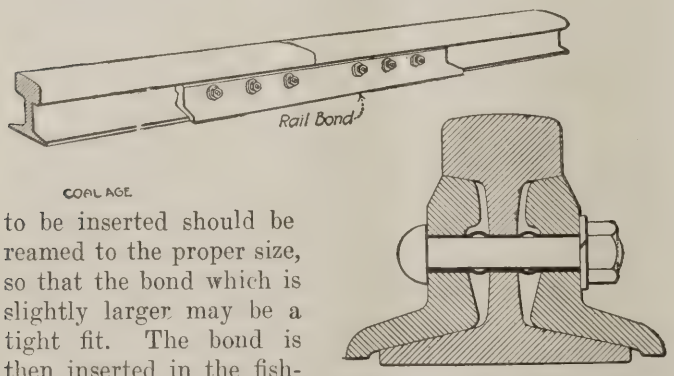
The forming of the junctions between the metals or alloys presented another set of troubles. In some cases the parts were screwed together, but with that method of construction oxidation was apt to occur and cause an undue increase in the resistance. Soldering, and especially hard soldering, is possible only with certain metals and over small surfaces. And even where this method is employed, the junctions prove unable to resist a high temperature for any considerable period of time. Welding, again, is impracticable with many metals.

In the Marschall apparatus, an attempt has been made to overcome these difficulties. The positive electrodes are made of a special alloy, which yields a high electromotive force but has a low specific electric resistance. The negative electrodes are composed of a copper-nickel alloy, while the junctions between the two are ingeniously effected by means of electro-deposited copper.

Five of the elements thus constructed are arranged together in series to form a "section," and a number of these sections are bound together in a ring, the junc-

tions which are to be heated being all at the bottom of the sections and those which are cooled at the top. As many of these rings as may be needed to give the required output are slipped over a central heating tube and clasped firmly upon it.

The furnace is designed as a gas generator, the fuel being gasified and conveyed to the heating tube, where it is burnt with the aid of a suitable air supply from without. Outside the rings there is a casing through which cool air circulates round the cold junctions of the thermopile, the object being to maintain as great a difference of temperature as possible between the cold and the hot junctions, which latter rest on the central heating tube.



An experimental pile containing 10 elements has been tested in this country (England), and with a temperature difference of about 300 deg. C. (540 deg. F.) between the hot and cold junctions the electromotive force was found to be 0.03 volt per element. It is estimated that a plant 3 ft. in diameter and 7 ft. long, containing 1000 elements, could be constructed to give 1½ kw. at 35 volts. A plant with a capacity of about 1 kw. has been in operation for some time past in Dresden, and it is stated that so far no change has been noticed in the resistance of the hot junctions.

A New Rail Bond

The Jamison rail bond is nothing more than a bushing made of soft copper, the outside of which is slightly larger in diameter than the reamed hole in which it is to be placed. This bond is designed to be inserted in the same holes as the bolts which fasten the regulation fishplates to the rails. One or more bonds are placed on each side of the rail joint, depending on the size of the rails and the strength of the current which is to be transmitted.

Bolthole Bushings Instead of Copper Ribbons or Wires

When the rails are in place, the fishplates should be secured by at least one bolt in each rail to bring them into register, then the other holes in which the bond is to be inserted should be reamed to the proper size, so that the bond which is slightly larger may be a tight fit. The bond is then inserted in the fishplate, pressed through the rail and then through the opposing fishplate. In pressing the bond into its proper position, the holes in the rail and fishplates are coated with copper, giving a copper to copper connection.

A Bushing Rail Bond Using Fishplate as Conductor

Then a hardened-steel expanding mandrel is introduced which from the interior of the bond forces the copper into intimate contact with every particle of the surrounding steel of the rail and fishplates. Thus the bond is given a perfect contact with both the rail and the fishplates as the current can pass from rail to rail through the fishplates and bonds. The final step is to insert and tighten up the bolts.

This bond can be used for busbars on switchboards and for electric bridges but its largest use is for bonding the rails of electric railroads for the transmission of the return current. The method is alleged by the manufacturers to save 80 per cent. of the cost for material and labor in the providing of ordinary rail bonds. The fact that it is almost impossible to steal these bonds is a large item in their favor. As they are not visible when in use, they do not even tempt people to steal them.

A Durable Bond

It is stated, however, that the bond can be removed with ease by the use of a simple patented tool. As the bond fits air-tight into holes in the rail and fishplates, no moisture can enter to cause the bond to rust at the contact. Such a rusting would cause an imperfect contact, and the arcing which resulted would hasten the deteriorating action. But with such a close contact the primary steps leading to a loose and burned connection cannot occur.

The ordinary bond has two connections between copper and steel; this has four for each bond but as an offset there are connections to two fishplates and the chances of inefficient bonding are halved by that fact. Operators will be interested to note in what degree this bond is applicable to mine work.

Bond Not Sheared When Temperature Changes

The company publishes several testimonials showing that the bond has given satisfaction to street-car companies so it is evident that the expansion of the rail does not shear the bonds. This is probably due to the fact that the fishplate and rail are separated at the bolt hole and there is room for the bending of the bond between the moving surfaces.

Experiments by Wilbur A. Carrell & Co. showed that two of the bonds did not give an appreciable resistance and one with only two copper bushings gave one quarter the resistance of an equal number of ribbon bonds of the usual type. The manufacturers state that bonds placed April, 1910, in the Mifflin-Homestead line are in as good condition today as they were when placed in the rail.

The bond is made by the Jamison Rail Bond and Electrical Supply Co., 202-203 Keystone Bank Building, Fourth Ave., Pittsburgh, Penn.

Application of Fellow-Servant Rule—Employment of Minors—Amount Recoverable for Personal Injury—The rule which exempts a mine operator from liability for injuries to an employee resulting from negligence of a fellow employee does not apply to employees in charge of separate trains of mine cars. When a boy under 16 years of age is employed in a mine without his father's consent, the boy will be permitted to recover damages for injuries received by him in the course of his employment without regard to whether the employer has been guilty of negligence in the occurrence of the accident, if the employer knew that the boy was under age. Two thousand dollars is not excessive recovery for injury to such an employee, where his ankle and foot were crushed, he was confined to bed for more than a month, and was compelled to walk on crutches for several weeks after his confinement ceased. (Kentucky Court of Appeals, Stearns Coal & Lumber Co. vs. Tuggle, 161 Southwestern Reporter 1112.)

Who's Who in Coal Mining

Samuel Dean

Starting as an apprentice with a mining engineer and colliery manager in Lancashire, England, Samuel Dean has worked his way to a position of respect in the coal industry of that turbulent state, Colorado.

After serving his apprenticeship, Mr. Dean was employed at the Rainford Colliery in Lancashire, doing various kinds of work underground. Following this employment, he had charge of mines in the County of Durham and was particularly successful in sinking a mine shaft through running sand at one of the collieries where he was employed. Following this accomplishment, he had several other experiences in shaft sinking through

Samuel Dean

heavily watered strata and is today somewhat of an authority on this subject.

Mr. Dean left England in 1907, coming to this country and a little later organizing the Gallup Southwestern Coal Co., Gallup, N. M. He was the first manager of this company, Harry Lauder, the Scotch comedian being one of the stockholders. Mr. Dean joined the engineering staff of the Victor-American Fuel Co., in 1910, and probably was the first person to introduce stone-dust treatment in American mines. He is a member of the North of England Mining & Mechanical Engineers and the Rocky Mountain Coal-Mining Institute. He holds a first-class manager's certificate issued at Manchester, England, in 1903. He is also the holder of Colorado mine foreman and fireboss certificates, and has been captain of the Delagua first-aid team for the last three years.

Mr. Dean was recently elected to the "Daglish Traveling Fellowship" by the University of Durham, England, and in accordance with the stipulations of this fellowship, he is now concluding an extended trip of investigation through European mines. His observations throughout his European travels are now being published in Coal Age each week.

Mr. Dean writes from Montreal, Can., that he succeeded in leaving France after war broke out, reaching that city, Aug. 15, by the mail steamer "Tunisian." Fortunately he explored the German mines first and was visiting France when hostilities commenced.

Device for Detecting Firedamp

By Leonard Keene Hirshberg*

The difficulty of utilizing the well known property of platinum black for the detection of the presence of firedamp in coal mines, would appear to have been satisfactorily overcome in a recent invention of Alfred Williams. The rapid absorption of gas by platinum black causes a rise in temperature in the presence of even a small percentage of methane or firedamp. The circumstances, however, which have thus far prevented its useful application to the detection of gas in mines are: First, the difficulty of devising a reliable and easily understood means of indicating the percentage of firedamp present from the rise in temperature caused by the absorption of the gas; and, second, the fact that small percentages of firedamp do not sufficiently affect the platinum black when the initial temperature is low. The first difficulty has been overcome by a thermo-electrical method, and the second by a preliminary heating of the platinum black.

The instrument is so arranged that the air of the mine passes through a tube containing a pair of differential thermo-electric junctions, in series with each other and with a galvanometer, which may be fixed remotely from the thermo-couples. As long as the junctions remain at the same temperature, whatever that may be, their actions balance one another and the galvanometer indicates zero. Surrounding each junction, however, is a small head or capsule of a porous material. One of these heads is impregnated with platinum black, which raises the temperature of that junction when firedamp is present and causes a corresponding deflection of the needle of the galvanometer. Around or through each head is a minute loop of platinum wire carrying sufficient current from a small battery (the circuit being independent of the thermopile circuit), to raise the temperature to that at which platinum black is most sensitive. The galvanometer scale may be graduated in milli-volts; but preferably it should be graduated so as to read directly the percentage of firedamp present.

Tests of this instrument, made by Prof. Silvanus Thompson, have given satisfactory results, but indicate the necessity of keeping the auxiliary heating current at a constant value. One of the greatest benefits of a reliable method of testing for firedamp, independently of the miner's lamp, is that it permits of the exclusive use of electric lamps and thus displaces the ordinary Davy lamp, for the purpose of testing for gas.

Coke breeze which often lies in piles near beehive coking plants can be profitably utilized. The larger sizes can be prepared for foundry purposes, while the next larger size makes the best kind of fuel for hot-air furnaces in residences. The very fine material can be sold to zinc-retort operators.

*Johns Hopkins University, Baltimore, Md.

Editorials

The officers of great corporations are coming to realize that big business cannot be private. The management of any great industrial or mining enterprise is a form of government. It governs the lines of all its employees and many of its patrons far more intimately than the Administration and Congress of these United States govern them. Such a system generally exists through force or inheritance, which is wholly undemocratic because its rulers are not chosen by the votes of the people governed. That is why the so called common people are opposed to the old method of conducting business on monarchial lines where the keynote of all activity is secrecy.

The distinctive aim of the I. W. W. is to bring about the coöperative ownership of the tools of production. Just why it is necessary to use violence and break laws to realize this dream is more than we can understand. The employees of any great industrial corporation in America could obtain the complete ownership of the company they serve within four or five years' time if they so desired. There is no longer prejudice against ownership of stock by employees. The only difficulty in the way is the preference of the workers to get 3 or 4 per cent. without any risk of loss, than to assume the chances incident to industrial ownership. Workingmen in New York City alone have more than a billion dollars on deposit. If wage earners could be educated to know the powers and possibilities that are theirs, not only would the capitalist class disappear, but the general strike would be no more, for workingmen would then understand that wages are paid not out of capital, but out of production. It would be plain to all that the greatest crime that can be perpetrated against the wage earners is to stop production.

The War and the Coal Markets

Rumor-mongers are busy. Statements of all kinds are being circulated. Many bearing on the coal trade are without any foundation of truth. One report says a million tons of coal is to go to Russia. Other large tonnages are said to be on their way to Canada for the purpose of coaling British war vessels. Further dispatches would have us believe that the need for coal to supply Italy, Spain, Denmark, also Mediterranean countries and South American, is so urgent that the mines of the United States will have to work beyond capacity to fill the want.

The fact is, the coal business is unusually slow, and prices are unsatisfactory. The mines of this country in the present depressed state of business can supply with ease any quantity of coal the other nations may want. There is little likelihood the outside demand for American coal will equal or offset the decrease in domestic consumption, resulting from slack business this fall. It is, therefore, ridiculous to credit the current talk of fuel scarcity and price advances. Such statements do not emanate from the coal producer, but come from a few unscrupulous retailers who are endeavoring to profit by playing on the credulity of their uninformed customers.

That the conflict in Europe affords American coal-mine owners an opportunity to introduce their coals into foreign markets is true. If ships can be secured with freight charges reasonable, a few eastern fields (West Virginia and Pennsylvania especially) should secure a number of contracts for a considerable tonnage to South America and Europe. The Panama Canal is now open, and that is also a favorable condition.

As to the extent of our foreign possibilities, some idea may be gained from the following facts: Eight countries of South America purchase about $62,000,000 worth of coal annually. Of this amount the United States sold only $4,223,118 worth, while the British mine owners furnished $53,000,000 worth of coal to these eight countries. The greatest opportunities for American coal producers would seem to be in Argentine and Brazil, which countries annually import $25,000,000 and $24,000,000 worth of coal, respectively.

Our coal trade on the west coast of South America amounts to practically nothing. But now that the Panama Canal has been opened to shipping, we should secure some considerable part of the business of Chile, Peru, Ecuador and Bolivia. The first mentioned country imported $11,000,000 worth of coal last year, of which our share of business amounted to approximately $500,000.

There are also numerous opportunities at the present time for American coal on the other side of the Atlantic, and we should endeavor to avail ourselves of the present period to enter foreign markets; however, when the entire tonnage of possible exports is considered in the aggregate, the total is not a figure that holds hope of relieving to any great extent the unsatisfactory conditions in the whole fuel industry of America.

We produced last year about 575,000,000 tons of coal in this country; our mines could easily add another 100,000,000 to this output and not exert themselves very noticeably. Therefore, there is no occasion to get excited over an opportunity to send a possible 25,000,000 tons—but probably less—to foreign markets. As for any unusual increase in the price of coal to consumers, because of the European war, the idea is absurd, and it may be stated positively that mine owners have had no part in any such increase either actual or implied.

The Storage Problem

No problem is so important in mining as the discovery of a flywheel which will keep business moving steadily and normally year in and year out. Depression and excessive activity alternate, with the former occupying by far the longer periods.

However, the success of storage as a cure for this condition cannot be assured till the technique of that measure is better developed. C. A. Hall, the fuel agent of

the Chicago & Eastern Illinois R.R., at a meeting of the International Railway Fuel Association, of which he is secretary-treasurer, advocates storage of coal as a cure-all for excessive coal operation, low prices, unemployment, undue purchases of rolling stock, unequal seasonable traffic and other mining and railroad ills.

Now storage of coal would, if successful, perform all these services if coal could be stored as he suggests, but the limit of height in storage is 20 ft., and many coals under present conditions of storage will fire if the coal pile exceeds ten feet in height and may ignite spontaneously at even less depths in some cases. Mr. Hall himself sets the limit of height for coal piles of bituminous coals as normally 15 ft.

But it must be remembered that coal may heat if kept in far smaller piles and then it suffers much more deterioration than the United States Bureau of Mines and the University of Illinois have shown in their tables. Unfortunately despite the fact that the authorities mentioned have made abundantly plain that the storage must be practically without heating if the results tabulated are to be obtained, everyone who does not ignorantly question them, has taken them as being true so long as the mass does not actually fire.

It is important to remember that with one exception the results of Porter and Ovitz, of the Bureau of Mines, were obtained from small samples containing between 300 lb. and 6 tons and such small quantities could not suffer from heat storage. The one large mass of coal was stored under tropical conditions and may have wetted frequently.

In fact that oxidation is not the important cause of heating is evidenced by the fact that coal is slow to become heated, yet all the deterioration in the earlier stages is due to oxidation. Later the coal becomes dried out in the sun and when it is moistened the heat of hydration probably causes it to fire, though other causes are possible.

Perhaps by keeping coal continuously moist with a spray or by covering it with an envelope of some soapy substance like lysol, it might be prevented from complete dessication or if it should become dried it might more slowly became hydrated if it had a waterproof coat to protect it. These are possibilities well worthy of consideration, but until they have been tried or others of like character we cannot hope to keep stocks of highly inflammable coal in profitable bulk. It will be necessary to submerge it, or spread it in thin layers pneumatically over a large area and gather it in a similar manner.

The Bill against Strike Breaking

A bill has been introduced by John M. Evans, representative from Montana, making it unlawful to transport strike-breakers over state lines and to tranship arms from state to state for the defense of such men.

The only reason for forbidding the transportation of strike-breakers is to protect workingmen who are making just demands which should be granted. But this law equally protects also men who are striking for something which is not just. Thus the Industrial Workers of the World might strike to have the Western Federation of Labor men excluded from the Montana mines and if they did, the copper producers would have a restricted output and the railroads would be obliged to refuse transportation to the duly unionized Western Federation men if the company should "hire, employ or engage them." Moreover, the railroad would be forbidden to "transport, handle or carry any firearms or ammunition" for their defense.

In fact, the disorderly Industrial Workers of the World might drive out the Union and then prevent it from being recruited. All the violent actions in Butte, Mont., recently show how probable such a condition would be. The I. W. W.'s deliberately blew up the Federation safe and destroyed the building in which Federation men met. A few men were killed and a large number were victims of violence. A little more and the I. W. W.'s would have had unquestioned control, the Federation would have been driven out entirely and under this law, had it then existed, no new men could have been introduced and had they come in they could not have been defended.

We think the workingman really needs protection against the workers in some industries, who in knowing their strength raise wages abnormally, all of which other workers have to pay. Some of these trades limit those working in them to those having relations already in the Union and only a limited number of such relatives are counted as granting elegibility. One can become a glass blower if one's father or father-in-law has blown or is blowing glass, but not otherwise, though one may have worked at all the related labor in a glass factory.

The assumption in legislation such as we are discussing, is always that the workingman in a mass is right. What he wants he should have. But there is nothing to lead one to a judgment of this kind. He is, of course, certainly not always wrong and sometimes his cause is debatable, but prohibiting the importation of strike-breakers in every case is to assume that the employee who has struck is invariably right.

Let us suppose that one man, as often happens, incurs the dislike of the agitating force at a colliery. The mine becomes idle and the company can either discharge the man or seek men who are willing to work with the man in question. But now this last recourse is removed. The one man must be discharged and his rights are over-ridden by his fellows. We believe that the law Mr. Evans would enforce is a gross violation of individual rights. Labor which for centuries has struggled for freedom is now endeavoring to restrict its own rights by a series of arbitrary laws.

Eventually laboring men will learn that the larger trades employing the greater number of men will be able to tyrannize over all others and wages will be earned above the normal rate. The importance of these larger trades will be so great that the fear of their idleness will make the public take a favorable hand in the settlement of their strikes. Thus they will receive year by year an increased wage and the cost of their product will grind to the ground those workers whom chance will have kept out of such favored employment.

Legislation like that Mr. Evans advocates will prevent the man in one state who is getting $1.75 a day from going to another and making from $4 to $5. The United States will be a bitter jest to such a man who feels he is a citizen and yet receives the treatment of a man from Japan or China.

Legal Department

Diplomatic Controversies Concerning Coal as Contraband of War

By A. L. H. Street* .

Moore's Digest of International Law, which was published a few years ago by the United States as a public bulletin, quotes several interesting documents as showing the attitude of nations toward coal as a contraband of war.

One of the documents, a communication from Mr. Cass, Secretary of State, to our minister to France, sent in 1859, reads, in part:

"The discussion which at this time is going on respecting the military character of coal, and whether it is now excluded from general commerce as contraband of war, is a striking illustration of the tendency to enlarge this power of prohibition and seizure, and of the necessity of watching its exercise with unabated diligence. Here is an article, not exclusively, nor even principally used in war, but which enters into general consumption in the arts of peace, to which, indeed, it is now vitally necessary. It has become also important in commercial navigation. It is a product of nature with which some regions are bountifully supplied, while others are destitute of it, and its transportation, instead of meeting with impediments, should be aided and encouraged. The attempt to enable belligerent nations to prevent all trade in this most valuable accessory to mechanical power has no just claim for support in the law of nations; and the United States avows its determination to oppose it as far as its vessels are concerned."

Mr. Moore then quotes a declaration issued by a Spanish admiral in 1866, during a war between Spain and Chile and Peru, declaring coal to be contraband when coming from the Chilean mines. The declaration was partly based on this ground: "That a belligerant has a right to declare new articles to be contraband of war, when from the circumstances of the war they become, on the part of the enemy, elements for undertaking and carrying on hostilities." It is qualified, however, by the statement: "This declaration, confined as it is to a special case and peculiar to the present war, is not intended to establish any precedent with respect to the general principle, that coal should not be considered contraband of war." At the same time, the President of Peru issued a proclamation declaring coal to be contraband when destined for the use of Spanish ships of war.

This interesting statement, made by the United States Commissioner of Navigation in 1898, is, also, quoted: "Had coal been declared unconditionally contraband of war, the precedent would have been awkward in the event of war between foreign nations, where the United States as a neutral would desire the largest opportunities for the exportation of coal."

The Russian Government having declared coal to be unconditionally contraband in 1904, the British Government pointed to a declaration by the former government in 1884 that coal should not be deemed to be contraband. The officials of the Russian Government replied that they were justified in changing their views, "since 1884, during which time many developments and circumstances had occurred which had induced them to modify their opinion."

The opposition of the United States to the policy of declaring coal to be absolutely contraband is illustrated by the following extract from a message issued by Mr. Hay in 1904 to ambassadors in Europe: "In the wars of 1859 and 1870, coal was declared by France not to be contraband. During the latter war, Great Britain held that the character of coal depended upon its destination and refused to permit vessels to sail with it to the French fleet in the North Sea. Where coal or other fuel is shipped to a port of a belligerent, with no presumption against its pacific use, to condemn it as absolutely contraband would seem to be an extreme measure. . . . Many nations are dependent on coal for the conduct of inoffensive industries, and no sufficient presumption of an intended warlike use seems to be afforded by the mere fact of its destination to a belligerent port."

*Attorney-at-law, St. Paul, Minn.

Recent Judicial Decisions

Acquisition of Title to Land by Adverse Possession—If owners of adjoining tracts of land in Pennsylvania treated a fence as being on the true boundary line between them for more than twenty-one years, each acquired good title to the land extending up to the fence on his side, regardless of whether that was the true line or not. (Pennsylvania Supreme Court, Miles vs. Pennsylvania Coal Co., 91 Atlantic Reporter 211.)

Right to Enjoin Mining Operations as Nuisance—In a suit to restrain mining operations near plaintiff's dwelling-house, on the ground that they constitute a nuisance, a temporary injunction will not be granted pending a final hearing of the case, where it appears that that would involve large loss to the mining company and throw its men out of work, and that the injury to plaintiff will be comparatively slight, especially if the conditions have existed for some time and have been endured by him. (Pennsylvania Supreme Court, Alexander vs. Wilkes-Barre Anthracite Coal Co., 91 Atlantic Reporter 213.)

Claim for Injury Barred by Contributory Negligence—The manager of a coal yard who was injured by collapse of a footwalk in the yard, which was rendered defective through negligence of employees of a railway company, whose track extended into the yard, cannot recover against the railway company, if he knew of the defective condition, or by exercising reasonable care for his own safety could have known thereof. (Pennsylvania Supreme Court, King vs. Lehigh Valley Railroad Co., 91 Atlantic Reporter 214.)

Duty to Keep Coal Dock in Safe Condition—A lessee of a dock used in handling coal is bound, as between himself and the public, to keep the premises in such condition that they will be reasonably safe for persons who go lawfully upon the premises by express or implied invitation; and is prima facie liable for damages caused by defects in or dangers on the premises that reasonably could have been avoided by appropriate care. This is the law even though, as between the lessor and lessee, the former has agreed to keep the dock in repair. (Florida Supreme Court,, King vs. Cooney-Eckstein Company, 63 Southern Reporter 659.)

Sociological Department

Washington Holds Its First State Rescue Meet

By J. Bagley*

SYNOPSIS—The operators, the Union, the American Mine Safety Association and the Red Cross hold a conjoint meet at Seattle, Wash., thus starting a movement to hold in the future a state-wide contest once every year.

The first state-wide mine-rescue and first-aid meet in the state of Washington was held in Denny Field, University Campus, Seattle, Washington, on July 22 and 23, by the miners and the operators of Washington under the auspices of the U. S. Bureau of Mines and the State Mine Inspection Department. This meet was the first of a series of annual events and was pronounced by all present to have been the most successful ever held in the state.

The contest was in charge of W. D. Ryan, U. S. Bureau of Mines, who also awarded the prizes; H. M. Wolflin, district mining engineer, U. S. Bureau of Mines, and a committee composed of J. J. Corey, U. S. Bureau of Mines; James Bagley, state mine inspector; D. C. Botting, commissioner, Washington Coal Operators' Association, and Martin J. Flyzik, president District No. 10, United Mine Workers of America. The judge in the mine-rescue contest was Thomas Graham, chief inspector of mines of British Columbia. The other judges were: Drs. Don H. Palmer, H. C. Ostrom, Frank Maxson, H. Housten, A. L. Loe, H. D. Dudley, J. Tate Mason, George N. McLoughlin, D. C. Hall and Major Edger, of Fort Lawton.

A miniature mine was constructed on the field and consisted of a drift 150 ft. long, on one side of which two rooms were shown connected at the first crosscut to represent work carried on in a flat seam, and on the other side an 8-ft. chute was erected on a pitch of 45 deg. and carried up 30 ft. to show how men were rescued in the pitching seams of the state. A smoke house was constructed in front of the mine and each helmet team underwent the test of remaining 5 min. in the smoke before entering the mine. An examination was made by a fireboss to show the method of procedure in mine inspection and reporting as carried on in practice. All men before entering the mine obtained their checks at a checking house near the mine mouth and checked in on their return from the mine.

Mines in the state of Washington are operated by 28 different companies in districts within a radius of 100 miles from Seattle and are scattered throughout the state. The U. S. Bureau of Mines maintains a mine-rescue station on the university campus in charge of J. J. Corey, foreman, for the purpose of giving assistance in times of distress and teaching men relief work throughout the state.

Eight teams participated in the contest representing the foremost companies in Washington. These were: No. 1, CleElum; No. 2, Franklin; No. 3, Roslyn; No. 4, Issaquah; No. 5, Roslyn; No. 6, Black Diamond; No. 7, Roslyn Fuel Co.; and No. 8, Ravensdale. It must be explained that some of the members of the corps that took part in the first-aid contest did not participate in the mine-rescue contest.

CONTEST OF FIRST DAY

The contest began at 1:30 p.m. of each day, and on the first day was as follows:

First-Aid Contest—No. 1. Team event—Time, 20 min. Simple fracture of right thigh; fifth and sixth ribs on left side broken; compound fracture of right wrist with bright red bleeding. Treat and carry 50 ft.

First-Aid Prize Winners, Cle-Elum Team No. 1

From left to right: E. E. Simpson, T. Barros, T. Summerill, captain, W. Ray, F. Ashurst, W. Saul

Mine-Rescue Prize Winners, Roslyn Fuel Co. No. 7

From left to right: T. Wallace, H. Taylor, W. Shaw, captain, E. Taylor, J. McGraw

No. 2. One-man event—Time, 7 min. Miner is overcome by gas. Remove 20 ft. to fresh air and perform artificial respiration for one minute.

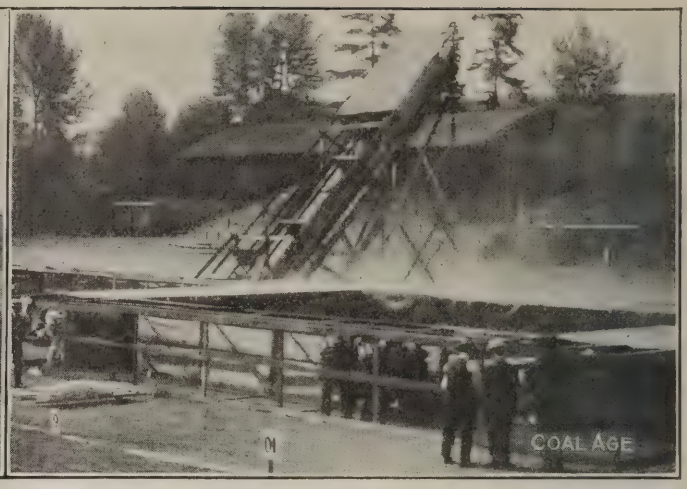
No. 3. Two-man event—Time, 8 min. Simple fracture of right forearm; right lower jaw broken.

No. 4. Four-man event—Time, 15 min. Patient overcome by powder smoke; right forearm broken. Improvise stretcher and carry 100 ft.

No. 5. Three-man event—Time, 8 min. Head, face, neck, arms and hands burned by gas ignition.

No. 6. Team event—Time, 15 min. Miner caught between loaded car and rib; right shoulder blade broken; left arm broken 6 in. above elbow; left foot crushed; lacerated right cheek; improvise a stretcher and carry 100 ft.

No. 7. Two-man event—Time, 10 min. Flesh torn off back of left hand; compound fracture of right arm.



No. 8. Team event—Time, 20 min. Compound fracture of right thigh with severe arterial hemorrhage, and compound fracture of left forearm. Treat patient and carry 100 ft.

Mine-Rescue Contest—Team of five men, including captain, equipped with artificial breathing apparatus. Recovery work after mine explosion caused by blown-out shot. Carry miners rescued to air; perform artificial respiration for two minutes; treat for burns on face, hands and back.

*State mine inspector, 503-504 Alaska Building, Seattle, Wash.

TEAMS EXHIBITING MANNER OF BRINGING VICTIM DOWN A STEEP PITCH

MINE-RESCUE TEAMS REMOVING VICTIM AFTER A SIMULATED EXPLOSION

CONTEST OF SECOND DAY

The events on the second day were as follows:

First-Aid Contest—No. 1. Team event—Time, 20 min. Explosion of keg of powder, burning miner severely on face, neck, chest, back and both arms. Improvise stretcher and carry 100 ft. Treat patient.

No. 2. One-man event—Time, 8 min. Severe cut on forehead, right hand mashed.

No. 3. Two-man event—Time, 18 min. Man found lying with back across electric wire. Remove from contact and treat for electric shock.

No. 4. Three-man event—Time, 10 min. Right knee-cap fractured by fall of rock; left hand badly mashed. Improvise stretcher and carry 50 ft. Treat patient.

No. 5. Team event—Time, 20 min. Miner caught by flying coal from supposed missed shot. Right side of face badly cut; right eye blown out; simple fracture of right thigh; three lower ribs on left side broken. Treat and carry 100 ft.

No. 6. Team event—Time, 20 min. Miner with severely injured spine; fracture of right upper arm; treat and carry through tunnel and over obstruction.

Exhibition event not to be considered in contest.

Two-man event—Miner going back into chute too soon after firing a shot, overcome by powder smoke. Remove 20 ft. to gangway, perform artificial respiration for two minutes.

Note—A place to represent a chute will be built on the ground and all teams are expected to take part in this event if called on.

Mine-Rescue Contest—Team event—Mine fire. Seal off fire and remove one of helmet men in distress; carry to fresh air and revive.

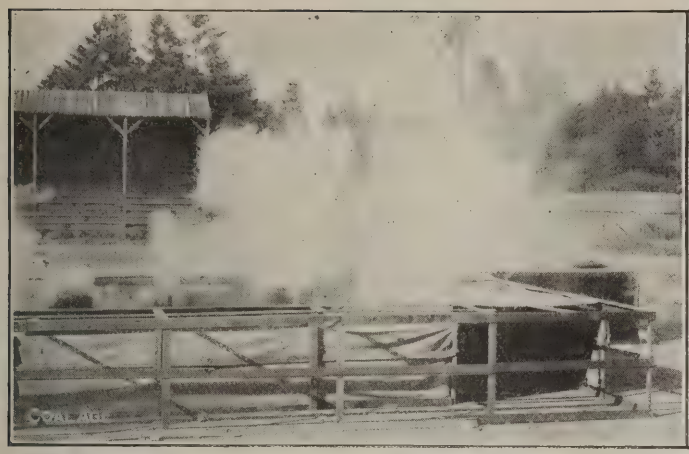
Team will consist of five men, one of whom shall be captain.

The general rules governing the contest were the standard rules for governing first-aid and mine-rescue contests as used by the American Mine Safety Association.

AWARDS

In the mine-rescue contest Team No. 7 of the Roslyn Fuel Co. won the first prize consisting of a silver cup and American Mine Safety Association medals. The Issaquah Team No. 4 won the second prize consisting of two Koehler mine safety lamps and three subscriptions to "Coal Age." The Roslyn Team No. 5 won the third prize consisting of five yearly subscriptions to the "Colliery Engineer."

In the team events of the first-aid contest CleElum Team No. 1 won the first prize consisting of a silver cup and American Mine Safety Association silver medals and Red Cross medals. This cup must be won at two consecutive state-wide meets to be retained by the team. The Roslyn Fuel Co. Team No. 7 won the second prize consisting of American Mine Safety bronze medals, American Red Cross certificates and one Johnson & Johnson first-aid cabinet. The Issaquah Team No. 4 won the third prize consisting of one Bauer & Black first-aid cabinet.



In the one-man events the first prize, $4 cash, went to Black Diamond Team No. 6, and the second prize, two "Justrite" acetylene lamps, to the Roslyn Team No. 5. The first prize, $5 cash, of the two-man events, was won by the Issaquah Team No. 4, and the second prize, three "Justrite" acetylene lamps, was won by Franklin Team No. 2. The first prize for the three-man events, three one-year subscriptions to "Coal Age," was won by Black Diamond Team No. 6, and the second prize, $6 cash, was won by Ravensdale Team No. 8. The first prize of the four-man event, which was a silver cup, to be retained by the winning team, went to Roslyn Team No. 5, and the second prize, $5 cash and Baldwin mine lamps, was won by the Roslyn Fuel Co. Team No. 7.

Two silver cups were contributed by the E. I. DuPont de Nemours Powder Co., one silver cup and $15 cash by the United Mine Workers of America and $25 cash by the Denny-Renton Clay & Coal Co.

The competition was keen and the averages resulting showed that the improvement in first-aid and mine-rescue

PARTICIPANTS IN THE FIRST STATE-WIDE FIRST-AID AND MINE-RESCUE

The Brattice-Cloth Heading and a Representation of a Mine Explosion

First-Aid Teams in Competition on the Denny Field, University Campus

work in the state is bringing its devotees closer to perfection.

Among those taking part in the meet either as directors or as members of the corps, were the seven men who in 1911 attracted attention at the contest in Pittsburgh in competition with teams from all over the United States. The team was captained by J. Hutchinson, of the Northwestern Improvement Co.'s mine, and was made up of S. McCulloch, a member of the Roslyn Fuel Co. team; James Bagley, now state mine inspector; A. G. Lindsay, a member of Roslyn Team No. 3; D. C. Botting, former state mine inspector and now commissioner for the Washington coal operators, and J. Parker, a member of Issaquah Team No. 4.

Among the other prominent mining men present were: C. C. Andersen, general manager of the Northwestern Improvement Co.; J. Ash, superintendent of Roslyn Cascade Coal Co.; E. N. Brooks, general superintendent of the Washington Union Coal Co.; C. H. Burnett, retired coal operator; R. Christensen, superintendent of the Pacific Coast Coal Co., Black Diamond; Wm. Graham, chief inspector of mines, British Columbia; S. H. Ash, deputy state inspector of coal mines; Wm. Hann, general superintendent of the Pacific Coast Coal Co.; E. Jacobs, secretary, Western Branch Canadian Mining Institute; J. F. Menzies, manager Carbon Hill Coal Co.; A. Patrick, vice-president, Roslyn Cascade Coal Co.; C. E. Jones, general superintendent of Roslyn Fuel Co.; G. Rockefeller, superintendent Fairfax Mine, Inc.; W. Warnock, superintendent Franklin District Pacific Coast Coal Co., and D. R. Swen.

Much credit for the success of the meet is due to the committee in charge for its earnest work in arranging and conducting the contest, to H. M. Wolflin and W. D. Ryan, of the Federal Bureau of Mines, who gave much time and attention to the promotion of the meet; to Henry Landes, president of the State University, for his assistance in obtaining the labor and field equipment, and to the Coal Mine Operators' Association and miners for their hearty coöperation.

J. D. Ryan, of the Federal Bureau of Mines, concluded the program by awarding the prizes and giving a speech in the course of which he congratulated all the teams and expressed much gratification with the excellent work of the contestants.

Welfare Work at Weyanoke W. Va.

Special Correspondence

R. D. Patterson, vice-president and general manager of the Weyanoke Coal & Coke Co., ever seeking to provide a means for increasing the returns to his stockholders, while raising the income of his workmen, has adopted the sound principle of providing playgrounds for the children, tennis courts and baseball diamonds for the young. At the same time he has stimulated an interest in vegetable gardening, flower gardening and sanitation among the miners and their families. Not only is this done by kindly words of advice, but by thoroughly competent lectures and personal instruction in gardening, and by furnishing, gratis, all seeds, lime and fertilizer desired. In order to stimulate a wholesome rivalry, substantial prizes, varying from $20 in gold down to $2, were awarded to the successful contestants.

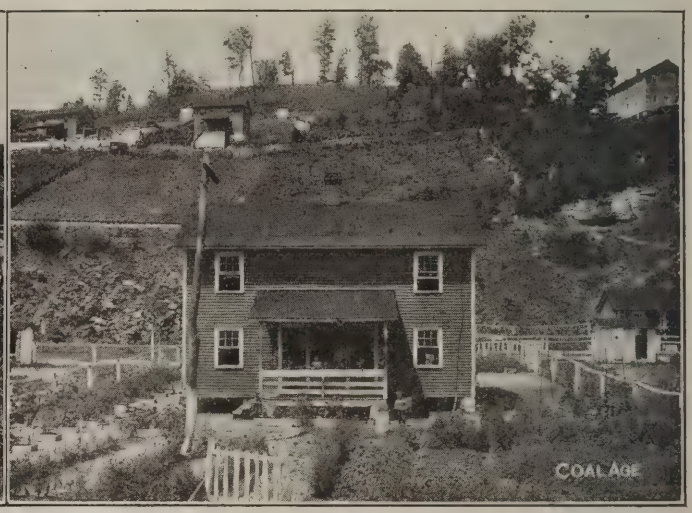
Saturday, July 24, 1914, was a day of pleasant anticipation in the town of Lowe, the unpretentious, though prettily nestling village which has grown up about the plant of the Weyanoke Coal & Coke Co.; for the judges

Meet in the State of Washington, Held at Seattle, July 22 and 23

of awards in the several contests, E. A. Schubert, industrial agent of the Norfolk & Western Ry., an expert in agriculture and horticulture, C. A. Honaker, of the Bluefield *Daily Telegraph,* a local expert on sanitation, and Shutt Grady, of the Pocahontas Coal & Coke Co., were there inspecting and noting and finally deciding to whom the prizes should be awarded.

Gardens Have Made Lowe a Healthy Town

The excellent work accomplished by these men, women and children, which may be accepted as an outward expression of the contentment and happiness within, caused the judges frequently to stop and wonder why it was that the management of all industrial plants, even small municipalities, did not adopt this means of increasing the contentment, health, happiness and efficiency of the citizens of the community.



Much to the credit of the Weyanoke Coal & Coke Co., it may be said that not one case of serious illness has occurred at Lowe in over six years and typhoid fever is a name only. Finally, after much hesitation, for out of the hundreds of gardens viewed, it was difficult to chose winners, the judges made the awards.

The first prize for gardening, $20 in gold, was awarded to Frank Barton; the second prize in gardening, $18, was awarded to J. L. Burnett; the first prize for flowers, $5 in gold, was also awarded to Mrs. J. L. Burnett; and the first prize in sanitation, a luxurious lawn swing, was awarded to James Gordon, colored.

This company is ably demonstrating the fact that giving its miners all the comforts of life possible pays good returns and increases their physical vigor, making it possible for them to give more in return in a day's work. That the miners and their families receive a larger return is admitted at once, and it is only necessary to say that the vegetables in some gardens were valued at over $150, and few gardens there were that did not appraise at $50. The produce obtainable will total upward of $4000.

Garden Which Received First Prize

One of the Flower Gardens

The Most Sanitary Premises

A Prize-Winning Garden

Every square foot of bare pipe carrying saturated steam at a temperature of 330 deg. F. (100 lb. gage pressure) will represent a loss of 625 B.t.u. with a surrounding atmospheric temperature of 62 deg. F. There are various insulating materials in general use and tests show that the percentage of saving over bare pipe are as follows: Hair felt, 87 per cent.; magnesia, 87 per cent.; asbestos, 89 per cent.; silicated cotton, 90 per cent.; magnesia sectional covering makes a neat and firmly effective lagging, but has the objection that it will not stand much handling. It is, however, for its cost perhaps as effective a covering as can be obtained. Hair felt is now never used with the highest temperatures owing to the danger of combustion.

American Mine Safety Association

The following is the program of the Association for its meeting in New York City at the Waldorf Astoria, Sept. 7-10.

Sept. 7—Morning, sight-seeing and getting settled. 2 p.m., address of welcome. Reading of minutes. Report of executive committee. Meetings of subcommittees. Evening, entertainment.

Sept. 8—Morning, business session. Committee reports. Afternoon and evening, excursion to Coney Island by boat. Shore dinner.

Sept. 9—Morning, business session. Committee reports. Afternoon, closing business session and adjournment. Visit to Museum of Safety in Engineering Societies' Building.

Sept. 10—All-day excursion around Manhattan Island, with visit to New York Edison Co. at 38th St. station, and to the work of the Public Commission in tunneling the Harlem River.

The Edison companies have developed several exceptionally valuable methods of guarding against shocks from currents of high voltage and a visit to their works will well repay those who are interested in electrical work. Ladies will be welcome and a special program is being prepared though in all cases the trips to points of interest will be open to both ladies and gentlemen. The trip around Manhattan has been substituted for the advertised visit to the yacht race because that race is deferred for a year.

The field meet will be held at Terre Haute, Ind., on Sept. 12, at Central League Baseball Park. In the evening, there will be a smoker and social session. Dr. J. A. Holmes, director of the Bureau of Mines, J. P. Reese, president of the American Mine Safety Association, Governor Ralston, Mayor Roberts and others are on the program as speakers.

Everyone who is interested in the mining industry is invited to be present at the meet. No admission will be charged. All squads desiring to enter should notify either H. M. Wilson, secretary American Mine Safety Association, or the Bureau of Mines, both at Pittsburgh, Penn., or Dr. August F. Knoefel, Terre Haute Trust Building, Terre Haute, Ind. This notification should come through the superintendent of the company by whom the contestants are employed.

MINE-RESCUE TEAMS AT STATION NO. 1, HARDIEVILLE, LETHBRIDGE, ALBERTA

Discussion By Readers

Problems in Rescue Apparatus

Letter No. 2—Referring to the recent discussion in reference to the reactions that take place in the human body and, particularly, to the relative volumes of oxygen consumed and carbon dioxide exhaled, COAL AGE, June 27, p. 1062, the following information will be of interest, coming as it does in response to my request, from an eminent physiologist in England, who writes:

"In the description of breathing apparatus used in mine-rescue work it is commonly stated that 2 liters of oxygen per minute or 120 liters per hour is supplied to the wearer. That is the amount of oxygen required by a man when doing moderately hard work. His output of carbonic acid or carbon dioxide will be approximately the same, namely, 120 liters per hour; and the absorbent provided must be capable of taking up that amount of carbonic acid per hour. The amount of carbonic acid breathed out is the same as the amount of oxygen taken in when a man is oxidizing carbohydrate food, and getting the energy of the work he is doing entirely out of that carbohydrate.

"By carbohydrate food I mean such food as starch, which is one of the chief constituents of bread, potatoes, sugar, etc. If a man is oxidizing fat or protein, which is the chief constituent of meat, he will not expire quite as much carbonic acid as he inspires oxygen. This is because part of the oxygen is utilized in oxidizing the hydrogen in the fat or in the protein, and leaves the body in the form of water. This water is not excreted necessarily in the expired air; it may be passed out from the kidneys in the urine, or from the skin, in the form of sweat. At the most, less than one-third of the oxygen would be turned into water, supposing the man were doing his work on a diet of fat and meat.

"The more carbohydrate food a man eats (and that is the food that a workman takes most of), the more nearly will the amount of carbonic acid expired correspond to the amount of oxygen inspired. The relationship of carbonic acid expired to the oxygen inspired is given by physiologists as the quotient, expressed by the symbols CO_2/O_2, called the "respiratory quotient." On a carbohydrate diet this respiratory quotient equals 1, while on a diet of protein and fat it will more likely equal 0.75."

The "Mine-Ruin" Law

The writer of the article in COAL AGE, Aug. 8, p. 239, entitled "Magnifying Supposed Evils," is evidently much in the dark in regard to the far-reaching results of the mine-run law as affecting the Ohio coal trade. This fact, no doubt, enables him to look on what he terms "the bright side of the proposition." It is truly a commendable way to regard the difficulties that, from time to time, obstruct our path. It is always easier, however, to look on the bright side of a proposition in regard to which we are but slightly informed.

The coal operators of Ohio have looked in vain for any bright side in the practical operation of the mine-run law, with which they have been confronted. I am pleased to say, from my own knowledge, the editorial that appeared in COAL AGE, June 13, p. 974, and other similar ones, have stated the condition, in respect to this law in Ohio, correctly. While our Kansas friend, writing in COAL AGE, July 25, p. 155, makes it a trifle strong from the standpoint in Ohio, there is not a shadow of doubt but that he is right when he sums up briefly the legitimate results of the mine-run law as "decreasing the revenue from the sale of coal by producing large quantities of a lower-priced quality; causing the loss and abandonment of much coal that could be otherwise profitably worked; increasing mine accidents; . . . overcrowding the mines with unskilled and ignorant workmen, and finally destroying large areas of surface lands."

When we consider that a large majority of the coal companies in Ohio, today, are not making a dividend of 1 per cent. on their investment when running normal, it is not difficult to understand that if this slight margin is to be still further reduced by the inferior quality of the coal produced, together with an excessive amount of fine coal that must be paid for by the operator, it is only a question of time when the coal operators of Ohio will be driven to the wall.

When Mr. Hogarth attempts to reassure the Kansas correspondent with the statement that in the district where he is located (Pittsburgh district) "all the coal is mined on a mine-run basis," he is evidently of the opinion that Kansas is situated similarly in respect to both mining and market conditions. While I am not familiar with the conditions existing in Kansas and must accept as correct the correspondent's description of the working of the mine-run law in that state as being disastrous, I do know conditions in the Ohio market and in the Ohio mines; and I can state positively that the operators of Ohio regard this act not as a mine-run law, but as a "mine-ruin" law. Such are the mining and market conditions in this state, that this law and the regulations governing its operation, can only bring disaster to the industry.

Referring again to Mr. Hogarth's letter, the mines in Heilwood are or were for years run nonunion, which rendered the matter of maintaining discipline in them much more simple than where the U. M. W. of A. has swing. While I am aware that 90 per cent. of the miners employed in those mines are foreign-born, they are not the I. W. W. element with which we have to deal in Ohio.

Without criticizing either union or nonunion mines or miners, the fact should be patent to everyone that the question of maintaining discipline in a nonunion mine is a much simpler problem than is presented in a mine where a union asserts its control. In the nonunion mine

a violation of state law or mine regulations can be punished as it deserves; but the discharge of a man for a similar violation of law or regulations, in a union mine, is a serious matter, however flagrant may be the violation.

In the latter case the mine committee at once gets busy and, in many cases, the company must submit to their dictation in the matter or run the risk of a shutdown as a result, the men going out on strike until such time as the matter can be put up to the district officials for adjustment. Moreover, the decision is not apt to prove favorable to the company, who may win out eventually in the case of a violation of state law, but the process is slow and tedious. Many operators will put up with a rank violation of discipline rather than entail the expense and inconvenience of a shutdown.

In order to show the attitude of one of the highest officials of the U. M. W. of A. in respect to the policy he desired the miners to adopt in reference to laws they felt were injurious to them, permit me to quote from his recent speech advising the acceptance of the mine-run law, with its provisions for docking the miners for a certain amount of impurities found in their cars. He spoke in effect as follows:

> By the provisions of this law, you must be fined by a Justice of the Peace for such violations of mine regulations. Now, men, we elect the Justices of Peace in all the mining districts; so let them provide for these fines in the law, and we, by our votes, will see to it that the fines are not enforced.

When a man who is a leader of an organization advocates the evasion of law through political power, it can readily be seen that it is a simple matter for the rank and file of the organization to follow his bidding.

If coal mining were as profitable as many think it is, it would be of great advantage for operators in different states to come together and discuss problems of general interest, and thereby learn of each other's difficulties, and how they may be best overcome. Under existing conditions, however, we must forego this pleasure and content ourselves with discussing such problems in a common forum. My conclusion is that the *mine-run law*, as far as Ohio is concerned, is bound to prove the MINE-RUIN LAW.

O. P. RATER.

———, Ohio.

Needed Education

It is with a feeling of regret and some anxiety that one observes the growing activities of the I. W. W. and kindred organizations. The drama recently enacted in the industrial affairs of Colorado and Ohio would seem to suggest, at least, the possibility that in some future day should these tendencies of man's primitive nature be allowed to gain a permanent ascendency, brute force might replace vested authority, and unreasoning demand take the place of calm judgment and justice. One might even imagine that the standing of the individual in a community, as in the days of barbarism, must soon depend on the strength of his right arm.

As was suggested in an editorial, COAL AGE, Vol. 5, p. 1058, the question may well be asked whether America is capable of assimilating the great tide of immigration now coming to her shores, and maintain the integrity of her standard. In the recent events to which reference has been made, one beholds a mad stampede of unreasoning destruction and barbarous cruelty. The actors in the drama were largely recruited from the foreign element.

The essential difference between the primitive and the civilized man is that the one is ruled by impulse, the other by reason. To avoid the admittedly rather vague possibility of this too impulsive foreign element eventually gaining control of our country, two solutions present themselves. They are as follows:

First, the exclusion of the morally uneducated and mentally undeveloped immigrant. It may be argued that, at the present stage of development, this would work a serious hardship on American industries, which, in a measure, is true.

Second, the need of what I would call the "moral education" of this primitive type, both native and foreign born. Certainly, this sounds like a difficult proposition; but when we remember that man is endowed by nature with reason, which enables him to anticipate his needs and makes him a law unto himself, it is clear that he has risen above the primitive level; and the morally educated man has overcome the blind instincts of the primitive man.

The education needed most, today, is the kind that will teach men how to live in peace and contentment. It should be recognized that the demand for an increased wage is inspired not so much by an existing necessity as by the desire for greater possessions. This desire, which is often an evidence of thrift and is commendable, if carried to excess may become a potent factor to crush out the refining influences of civilization, accelerating a reversion to the type. In avoidance of this, the needed education must show a man how to spend his money in a prudent manner; how to buy and prepare nourishing and wholesome food; how to furnish and decorate his home; how to make his surroundings sanitary and attractive; and last, but by no means least, it must teach foreigners how to speak and read the English language.

Until recent years, the assimilation of the foreign element has been left to take its own course, by gradual familiarity with American customs. At the present time, because of the increasing number, and the more closely drawn social lines, this method is no longer adequate; but moral education should be placed more and more in the hands of trained and competent teachers.

ERNEST L. BAILEY,
Mining Engineer.

Crumpler, W. Va.

Safety in Relation to Cost of Production

In the many articles and papers that have been written and read in support of the safety-first idea, in respect to coal mining, it is remarkable that the economic side of the question has been wholly disregarded. In my opinion, this is a subject that should receive the most careful consideration.

To avoid being misunderstood, let me say that safety has been my watchword as long as I can remember, indeed from the time I first came to understand the meaning of the word. While I know and appreciate the importance of making conditions safe in all mining work, I regard it as equally essential to study the economic aspects of the production of coal. There is as great ne-

cessity for producing coal at a profit as there is to produce it under safe conditions. As an industry, a mining proposition is without value unless the dividends are assured. Few, if any, men engage in the coal-mining industry for love of the work or for amusement; the acquisition of wealth is the motive. An old saying is to the effect that "the desire to acquire wealth is the greatest incentive to progress."

These reflections make it clear that the profits in coal mining are an essential part of the proposition. The safety-first idea must not be regarded too strongly from the side of sentiment. Sentiment is a poor diet for a hungry man. The young man who hopes to acquire a fair knowledge of mining without close application and hard work will never make a practical success, until he is able to grasp the situation as a whole, and apply his knowledge so that it will prove to be more than a sentiment.

The safety-first movement must not be allowed to degenerate into a sentiment; it has a practical side, which must be regarded. We live in an age of competition. Coal operators in different mining districts compete for trade in the same market. They mine their coal under conditions that vary widely. These conditions, and the varying charges for transportation, greatly modify the profits for the same quality or grade of coal.

The situation is further embarrased by the fact that a low-grade coal costs practically as much to mine and transport to market as a high grade coal, while the wide difference in the selling prices of these two grades makes the mining of the one a lucrative proposition, while the other must often be sold on the market at a loss. I recall now two instances of this kind where one coal mined at 95c. per ton sold at $3.50 per ton, f.o.b. mines, while another coal in the same market, mined at 88c. per ton, only brought $1.07, f.o.b. mines.

These few thoughts are expressed in the earnest hope that some of the readers of COAL AGE may give their opinions, and that the discussion may prove helpful, by drawing attention to the economic consideration in relation to the safety-first movement. What are the essential requirements to secure reasonable safety in the mining of coal, and to what extent must small operations be burdened with their obligation?

In my opinion, the most earnest efforts should be made to bring the coal trade to a basis of greater uniformity, and thereby avoid as far as possible the present state of affairs in this regard. I believe that economy of production and safety of operation are closely allied factors of the coal industry.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

RELATIVE MEASUREMENTS

A common method of making physical measurements for the estimation of weight, volume, heat, etc., is by reference to some adopted standard. All such measurements are relative and are frequently termed "specific." Such, for example, are **specific gravity, specific volume, specific heat,** etc. The atomic weight of elements is often called **specific weight.**

The Elements—An element is a substance that has not, as yet, been resolved into parts of a different nature and is, therefore, regarded as being composed wholly of one kind of matter or **simple,** in contrast with a **compound,** which is composed of two or more elements or kinds of matter.

The following table gives the more important elements, together with their chemical symbols and specific or atomic weights:

TABLE OF THE MORE IMPORTANT ELEMENTS

International Committee (1910)

Elements	Symbols	Atomic weights H = 1	O = 16	Elements	Symbols	Atomic weights H = 1	O = 16
Aluminum	Al	26.9	27.1	Manganese	Mn	54.49	54.93
Antimony	Sb	119.3	120.2	Mercury	Hg	198.4	200.
Argon	A	39.6	39.9	Molybdenum	Mo	95.23	96.
Arsenic	As	74.36	74.96	Nickle	Ni	58.21	58.68
Barium	Ba	136.27	137.37	**Nitrogen**	**N**	13.9	**14.**01
Bismuth	Bi	206.34	208.	Osmium	Os	189.37	190.9
Boron	B	10.91	11.	**Oxygen**	**O**	15.88	**16.**
Bromine	Br	79.28	79.92	Palladium	Pd	105.9	106.7
Cadmium	Cd	111.5	112.4	Phosphorus	P	30.77	31.
Caesium	Cs	131.75	132.81	Platinum	Pt	193.44	195.
Calcium	Ca	39.77	40.09	Potassium	K	38.78	39.1
Carbon	C	11.9	**12.**	Radium	Ra	224.6	226.4
Cerium	Ce	139.13	140.25	Rhodium	Rh	102.08	102.9
Chlorine	Cl	35.18	35.46	Selenium	Se	78.6	79.2
Chromium	Cr	51.58	52.	Silicon	Si	28.1	28.3
Cobalt	Co	58.5	58.97	Silver	Ag	107.02	107.88
Columbium	Cb	92.75	93.5	Sodium	Na	22.82	23.
Copper	Cu	63.06	63.57	Strontium	Sr	86.92	87.62
Fluorine	F	18.85	19.	**Sulphur**	**S**	31.81	**32.**07
Gold	Au	195.62	197.2	Tellurium	Te	126.48	127.5
Helium	He	3.97	4.0	Thallium	Tl	202.37	204.
Hydrogen	**H**	**1**	1.008	Tin	Sn	118.05	119.
Iodine	I	125.9	126.92	**Titanium**	Ti	47.72	**48.1**
Iridium	Ir	191.56	193.1	**Tungsten**	W	182.53	184.
Iron	Fe	55.4	55.85	Uranium	U	236.59	238.5
Lead	Pb	205.44	207.1	Vanadium	V	50.79	51.2
Lithium	Li	6.94	7.	Zinc	Zn	64.85	65.37
Magnesium	Mg	24.13	24.32	Zirconium	Zr	89.88	90.6

The **above** table contains only 56 out of the 80 or more elements that have been discovered, many of which are so rare as to be of little practical importance. The values of the atomic weights are given referred both to hydrogen as unity and oxygen as 16. The heavy type indicates the values commonly used in the study of mine gases.

The Coal Age Pocket Book

The elements form the basis of all relative measurements with respect to weight, density, volume; and it has been discovered that there is an intimate and close relation between the atomic weight and the specific heats of substances.

Illustration—The density of air, referred to hydrogen as unity (H = 1), can be calculated from the relative weights and volumes of oxygen and nitrogen, which are the chief constituents of air. The composition of pure air, by volume, is practically, ogygen (O) 20.9 per cent., nitrogen (N), 79.1 per cent. Then, since the atomic weight of oxygen is 16 and that of nitrogen 14, the relative weight of 100 volumes of air, referred to hydrogen as unity is found as follows:

Oxygen,	20.9	× 16 =	334.4
Nitrogen,	79.1	× 14 =	1107.4
Air,	100	*vol's* =	1441.8

Therefore, one volume of air is 1441.8 ÷ 100 = 14.418 times as heavy as the same volume of hydrogen; or, the density of air referred to hydrogen is 14.418.

The percentage composition of pure air, by weight, is readily calculated from the above figures: thus:

Oxygen, $\frac{334.4 \times 100}{1441.8}$ = *say* 23.2 *per cent.*

Nitrogen, $\frac{1107.4 \times 100}{1441.8}$ = *say* 76.8 *per cent.*

Molecular Volume—Chemical hypothesis assumes that the molecules of simple substances each contain two atoms only, while the molecules of a compound substance may contain any number of atoms, but never less than two. Notwithstanding this multiplicity of atoms, **Avogadro's law** makes all gases, with a few unimportant exceptions, to contain the same number of molecules, per unit volume, when measured at the same temperature and pressure.

In other words, **all gaseous molecules, with few exceptions, are of the same size, at the same temperature and pressure.** This law holds true for all mine gases, and is important in the calculation of the relative volumes of gases concerned in chemical reactions.

Atomic Heat—An important relation has been found to exist between the atomic weights of the elements and their specific heats. Dulong and Petit (1819) found that the specific heat (relative heat capacity) of most of the solid elements vary inversely as their atomic weights, so that the product of these two factors is a constant quantity (6.4), which has been properly called the **"atomic heat";** and represents the common heat capacity of the solid elements, taken by weight in proportion to their atomic weights. The following are a few examples:

	At.wt.		*Sp.ht.*		*At.ht.*
Iron,	55.85	×	0.1190	=	6.6
Lead,	207.10	×	0.0305	=	6.3
Mercury,	200.00	×	0.0333	=	6.6

Inquiries of General Interest

Keeping Rooms on Sight

Having had some difficulty in keeping the rooms in our mine on the proper sight lines, I would like to ask for any suggestion as to the best method to employ that will enable the miners to drive their rooms in a straight line and parallel to each other. The usual method and the one that we have employed is to drive two plugs into holes drilled in the roof slate, on line or in the direction the room is to be driven. These plugs are about 3 ft. apart or less, and strings called by the miner "sights" are hung from tacks or nails in these plugs.

These sights are often lost; at other times they are wholly disregarded, with the result that the rooms frequently "hole" into each other. In a few cases, this has caused heavy roof falls and a serious loss of coal in the pillars, which had to be abandoned. A good, practical method of keeping rooms on line will be much appreciated by readers who have experienced the same difficulty.

MINE FOREMAN.

Middlesboro, Ky.

The difficulty to which correspondent refers is a common one. In most cases, the "sight lines" used by miners are not over 2 ft. apart. As a result, any slight variation in the position of these lines greatly magnifies the error at the face of the room. It is customary for a miner, from his position close behind the sights which he illumines with the light of his lamp, to line in the lamp of another miner held at the face of the coal, 30 or 40 yd. away. It is evident that the error of the line at the face may reach 3 or 4 ft.

A greater error, however, is liable to occur when these sights are extended and new sights put up in the room, unless the original sights have been carefully protected and the work of placing the new sights is done by an experienced person. To reduce the liability to error to a minimum, all sights should be extended and new sights put up opposite a breakthrough where it is possible to measure the distance between the sight lines of adjoining rooms.

A good suggestion has been made to the effect that sight lines are best extended by means of a chalk line on the roof. It is possible under a fairly smooth or uniform slate roof to establish a point in the roof some distance ahead, say opposite a breakthrough. If there are no timbers in the rooms, a chalk line can then be stretched between the entry sights and the point thus established. The cord is held taut and snapped against the roof, leaving a well defined line, which should then be marked by plugs at intervals.

All extensions should be made in the same manner, by stretching a chalk line between these plugs, and extending the same to the point where a new plug is to be placed. The usual sights 2 ft. apart can then be put up on this line as often as desired. In some cases, it may be considered better to go over the chalk line with a paint brush, making a permanent line, say 2 in. wide, and extending this as the room is driven forward.

Correction

Referring to the question of the transmission of electrical power as explained, COAL AGE, Aug. 1, p. 201, permit me to draw attention to a seeming oversight in the formula for finding the area of the wire required to transmit a current of 150 amp., a distance of one-half mile (2640 ft.), with a line drop of 19 volts. The constant 10.8 should be used instead of 21.6. This would reduce the size of wire required one-half.

In the same connection I would suggest, would it not, in this case, be better to assume a wire return, instead of a rail return?

E. B. WAGNER,
Kingston, Penn. Electrical Engineer.

We are glad to have correspondent draw attention to the oversight in the use of the double constant (21.6 mil-ft.) instead of the value 10.8, which should have been employed here, since the answer given assumes a rail return for which the pressure drop has already been deducted, leaving 19 volts as the permissible drop in the wire.

This answer was first prepared for a wire return, in which case the length of wire required is double the distance the power is to be transmitted, and the double constant (21.6) was used (Kent, 7th ed., p. 1033). But in order to show the more general case, in the transmission of power in coal mining, a rail return was afterward adopted without making the necessary change in constant.

The answer for a rail return should therefore read as follows:

$$Circ.\ mils = \frac{10.8 \times 2640 \times 150}{19} = say\ 225{,}100$$

The weight of a triple-braid, insulated copper wire of, say 250,000 circ.mils, as taken from manufacturers' tables, is 985 lb. per 1000 ft., or 0.985 lb. per ft. At 20c. per lb., one-half mile of this wire will cost $2640 \times 0.985 \times 0.20 =$ say $520.

On the other hand, however, assuming, as correspondent very properly suggests for the installation of a fan at some distant point on the surface, one-half mile from the power plant, a wire return, the required size of wire to transmit a current of 150 amp. a distance of one-half mile (2640 ft.), with a line drop of 275 — 250 = 25 volts is

$$Circ.\ mils = \frac{21.6 \times 2640 \times 150}{25} = 342{,}144$$

The weight of a triple-braid, insulated copper wire of say 350,000 circ.mils, as taken from wire tables, is 1345 lb. per 1000 ft., or 1.345 lb. per ft. At 20c. per lb. one mile of this wire would cost $5280 \times 1.345 \times 0.20 =$ say $1420.

Examination Questions

Questions for Examination of Mine Electricians

(Continued from last issue)

Ques. 30—Is a compound-wound motor, a constant-speed motor?

Ans.—No. A compound motor runs slower under load than with no load.

Ques. 31—On what does the speed of a motor depend?

Ans.—The counter current generated by the armature is a large factor in determining the speed of a series-wound motor when carrying a load.

Ques. 32—Why is the spider of a ring-wound armature made of brass?

Ans.—Brass is nonmagnetic. If iron or steel were used for this purpose these metals, being magnetic, would interfere with the magnetic field of the armature core.

Ques. 33—Does the voltage have any effect to decrease or increase the speed of a series-wound motor?

Ans.—The voltage of the electric current has little effect to change the speed of the motor.

Ques. 34—What is the average speed of the cutter-chain on a mining machine?

Ans.—The average speed of a cutter-chain is between 400 and 600 ft. per minute.

Ques. 36—If there is a break or an "open" in the resistance of a starting box of the common type, how would you locate the trouble and make quick repairs?

Ans.—Place the starting lever on the first button; then, with a screw driver or other piece of metal make connection between consecutive buttons, in order, till the break is found, as will be evidenced by the motor starting up. To repair the defect, place a "jumper" between those buttons where the break exists.

Ques. 37—Can an open circuit in an armature be detected by observation simply?

Ans.—An open circuit in an armature is frequently recognized by the greenish rings that appear to encircle the commutator, caused by the heating and oxidation of the copper, at that point.

Ques. 38—What is a compression cup?

Ans.—A compression cup is a grease cup having a spring-feed. A small spring forces a piston downward in the cup, by which means the grease is slowly driven out and lubricates the bearings.

Ques. 39—What is the wheelbase of a motor?

Ans.—The wheelbase is the distance between the centers of the extreme axles of the motor, and measures the base of support on the rail.

Ques. 40—Are chilled cast-iron or steel-tired wheels best for use on a locomotive?

Ans.—Steel-tired wheels give a greater tractive effort than cast iron, but cost more.

Ques. 41—How is the pitch of a gear ascertained?

Ans.—To find the pitch of a gearwheel, add 2 to the number of teeth and divide the sum by the diameter of the wheel in inches.

Ques. 42—What is the least number of teeth used in a pinion?

Ans.—In common practice, pinions are seldom designed with less than 12 teeth; but, in special cases, pinions of 5 teeth have been used, and 9 teeth are not uncommon.

Ques. 43—What is a castle-nut?

Ans.—A castle-nut is a nut having slots cut across the top, for the purpose of inserting a cotter-pin through a hole in the bolt, to keep the nut from unturning.

Ques. 44—What are the dimensions of a standard half-inch nut?

Ans.—A cold-pressed half-inch nut is ½ in. in thickness and ⅞ in. measured between the flat faces of the nut. The dimensions of a finished nut are slightly less than these, owing to the grinding down of the metal surface.

Ques. 45—What is the difference between a capscrew and a bolt?

Ans.—A capscrew is a bolt withiut a nut, the nut being the only difference between them.

Ques. 46—Is oil used when drilling cast iron?

Ans.—Oil is not commonly used, in drilling cast iron or brass, for the reason that, owing to the brittle nature of cast iron, the drill does not tend to heat as quickly as when drilling wrought iron or steel.

(Answered by Request)

Ques.—A mine sump is 60 ft. long, 10 ft. wide and 8 ft. deep. If this sump is full of water, how long will it take a pump to empty it, if the water end of the pump is 6 in. in diameter and operated at a piston speed of 100 ft. per min., assuming the efficiency of the water end to be 80 per cent.

Ans.—The sectional area of the water end is $0.7854 \times 6^2 = 28.274$ sq.in. At a speed of 100 ft. per min., the piston displacement of this pump is $(28.274 \times 100) \div 144 = 19.63$ cu.ft. Allowing for an efficiency of 80 per cent. at the water end, the quantity of water handled by the pump is $0.80 \times 19.63 = 15.7$ cu.ft. per min. The cubic contents of the sump is $60 \times 10 \times 8 = 4800$ cu.ft. The time required for this pump to empty the sump is then $4800 \div 15.7 = 305.7$ min., or 5 hr. 5.7 min.

Ques.—A current of 3000 cu.ft. per min. of air and gas is at its maximum explosive point; how much air must be added in order that the mixture will show a faint cap on a safety lamp?

Ans.—A firedamp mixture, at its most explosive point, contains 9.46 per cent. of gas. The volume of gas present, therefore, in this case, is $3000 \times 0.0946 = 283.8$ cu.ft. per min. Now, assuming that the first indication of a flame cap is seen, in the common unbonneted Davy lamp, when 2 per cent. of gas is present, the entire volume of gas and air required to produce this result would be $283.8 \div 0.02 = 14{,}190$ cu.ft. per min. The quantity of air to be added to the current, to produce this result, is then $14{,}190 - 3000 = 11{,}190$ cu.ft. per min.

Coal and Coke News

Washington, D. C.

Advices received from many sources continue to indicate that coal mining will probably be less disturbed as a result of the European war than almost any other industry in the United States, and that in some respects it will probably be stimulated by the war, as already indicated. Government officials have been reassured on this point by the data with respect to the shipment of coal from the mines which are now regularly supplied to them.

With respect to anthracite, the latest available figures received during the past week and made public indicate that last month's shipments were 5,391,897 tons, as compared with 5,487,852 tons in July, 1913, a decrease of 95,995 tons. Total shipments for the first seven months are about 2,000,000 tons behind those of last year, but this is apparently in no respect due to war conditions. On the contrary, the war situation is believed likely to aid in making up the shortage.

The amount of coal on hand at tidewater shipping ports decreased 39,630 tons from 554,120 tons on June 30 to 514,490 tons on July 31. The Lehigh Valley is reported to have led in tonnage last month with 1,026,225 tons, the Philadelphia & Reading second with 831,965 tons, and the Lackawanna third with 826,771 tons, the Erie fourth with 717,201 tons, the Central of New Jersey fifth with 708,891 tons, the Delaware and Hudson sixth with 671,682 tons, the Pennsylvania seventh with 406,760 tons, and the New York, Ontario & Western eighth with 302,362 tons.

The opening of the Panama Canal, which is now ready for business, an official trip having been made in the S. S. "Ancon" on the 16th of August, while various merchant vessels have been successfully put through, is expected to cause an immediate demand for fuel supplies in the Zone. South American countries are already manifesting a sharp demand for coal of various grades, due to the cutting off of other supplies.

Secretary Lane's View of the Situation

Secretary Franklin K. Lane, of the Department of the Interior, in an interview regarding the effect of the war on the United States, makes the following statement:

A direct benefit to the United States from the European war will be its effect in making the people of this country realize to a greater extent the value of its mineral resources. It is entirely possible to so utilize these resources and expand our industries that the label "Made in America" will become familiar in our own and foreign markets.

Of an importance second only to that of the food supply is the supply of mineral products necessary to meet the requirements of twentieth century civilization. One of the first effects of the war has been to make us realize the interdependence of nations in the matter of food supply. Most of the countries now at war are dependent upon importation of foodstuffs, and we have cause for self-congratulation in the United States that we are able to feed ourselves. What we possibly have not so fully realized is that we are nearly as independent in the possession of essential mineral resources, and that the interference with manufacturing caused by interruption of the flow of importations of many necessary raw materials may be overcome almost wholly by development of neglected resources in our own country.

"Do you mean," Mr. Lane was asked, "that the United States can make itself independent of the rest of the world in its manufactures?"

"Very largely," asserted the secretary. "The main difficulties to be overcome are in the rearrangement of the distribution system necessary to establishing this independence. Business is established along certain well-marked channels, and usually follows the line of least resistance. It has been easier, and perhaps cheaper, to import mineral products and materials from other countries than to go to the trouble and expense of developing our own resources of the same nature. Forced to the latter course by suspension of commerce with other countries, I believe that American enterprise and energy will almost at once turn to the development of the native resources, rather than permit production to lag and supply to be diminished in any industry.

"The Southern States have for years largely supplied the world with phosphates, but because of the distribution system, a large part of this supply has gone to Europe, and much of the phosphates used in the Western States have been imported across the Pacific. We have some 3,000,000 acres of phosphate lands in the West lying near the smelters, from which is produced the sulphuric acid necessary to convert these phosphates into a form available for plant food, and still there is no law by which these deposits can be made commercially available, although a bill which would allow of their immediate development has been favorably reported by the Public Lands Committee of the House of Representatives, and is awaiting the aproval of the House and Senate.

"While the United States leads in coal mines, the six European nations now at war happen to be the six next largest coal-mining countries, producing together over half the world's coal. Interference with both the mining and the commerce of these nations must necessarily increase the demand for our coal, at least in the neutral countries of the world. And coal is our one resource about which there need be no present anxiety. The United States is now producing 40 per cent. of the world's supply, and the reserves yet to be drawn upon exceed, so far as known, those of all the rest of the world combined."

An Additional Feature of the Rate Decision

A feature of the recent opinion of the Interstate Commerce Commission in the advanced freight rate case, to which considerably more attention is being given (because of its bearing on future coal rates) than was accorded to it by traffic men at the time it was first made known, is the question of relative railway earnings with respect to the movement of various classes of products over the lines concerned. The comparison shows that under existing rate conditions, the average net revenue of the railroads from the hauling of bituminous coal is 3.24 mills per ton mile, while the average net revenue per loaded car mile is 16c. These figures compare with 5.60 mills per ton mile on coke and 21c. per loaded car mile.

On other commodities, the statistics show that in certain cases the average net revenue per ton mile ran as high as 12c. and over, while the average net revenue per loaded car mile ran as high as 28c. The lowest figure for average net revenue per net ton mile was 2.77 mills, while the lowest average net revenue per loaded car mile was 6c. Average net revenue per ton mile on most commodities ran from 4 to 7c.

It is thus seen that the net revenue obtained on bituminous coal was distinctly below the average when measured per ton mile. On the other hand, the total number of carloads for which statistics were obtained was much greater in the case of bituminous coal than in that of any other commodity, amounting to 64,430 carloads.

In summing up the situation, the Commission says:

Instances will be found of ton-mile earnings as low as 0.58 of a mill and car-mile earnings as low as 1.69c. Other rates, while yielding higher car-mile earnings, appear very low when the value of the commodity is considered. For instance, there will be found through or proportional domestic rates on copper bullion below 2 mills per ton mile; the average yield on 676 cars of this commodity, as disclosed by the exhibits mentioned, was only 2.73 mills per ton mile and 11c. per car mile, whereas the average yield on 2486 cars of pig iron was 4.31 mills per ton mile and 17c. per car mile. A compilation prepared by the Commission showing the market prices for a series of years of the commodities covered by the traffic exhibits, together with representative rates thereon prevailing from time to time, will later be made available.

PENNSYLVANIA

Anthracite

Shamokin—Far up in a breast in the Cameron colliery of the Mineral R.R. & Mining Co., that had caved in early on Aug. 12, Leo Bulcosky was rescued late in the afternoon of Aug. 14 by a large force of men, headed by Superintendent William Reinhardt and State Mine Inspector P. F. Fra[illegible]. When found, he was in fairly good condition, notwithstanding he had been without light or food ever since being made a prisoner. As he crawled through a small hole into the arms of his rescuers, he asked for water, and after a small quantity was furnished him he wanted bread. Liquid refreshments were furnished him, after which he was wrapped in blankets and removed to the surface. A big crowd of spectators cheered him as well as his rescuers, and he was placed in an ambulance and taken to the state hospital for treatment against physical collapse.

The threatened general strike of Philadelphia & Reading Coal & Iron Co. employees in the Shamokin, Treverton, Mt. Carmel and Locust Gap districts, 5000 employees being involved, was averted on Aug. 16. The members of the United Mine Workers met at Shamokin and voted to report for duty on Monday, Aug. 17, as they had reason to believe matters would be adjusted satisfactorily with the company.

The big Alaska colliery workings of the Reading has been idle since Aug. 10, when the employees quit work because the company insisted on their obeying the order to produce checks issued by the company and to report at a central headquarters every morning and evening.

Scranton—The annual contests between the first-aid teams of the Delaware, Lackawanna & Western R.R. Co. will be held this year at Sans Souci Park (Wilkes-Barre), on Saturday, Aug. 22, when all teams from Scranton, Kingston and Nanticoke districts will particupate. Dr. Lake and District Supt. H. G. Davis are making the arrangements. The contests should prove of more than usual interest, for the winning team is to represent the company at the contests in New York City, to be conducted under the auspices of the Federal Bureau of Mines.

Pine Grove—The Public Service Commission, on Aug. 13, gave permission to the Philadelphia & Reading Ry. Co. to discontinue the evening passenger service between Pine Grove and Outwood on days when the collieries are closed, there being no demand for accommodation.

Bituminous

Colver—The coal town of Colver is one of the few towns in this section of the state which has not felt the effects of the war in Europe. The officers of the Ebensburg Coal Co. state that they expect to be able to sell all the coal they can mine for a year, and are laying plans for a decided expansion in business. One of the improvement plans is a large repair shop where the company will be able to make all its own repairs on mine cars.

Meyersdale—Judge Ruppel, on Aug. 12, ordered C. J. Rowe and C. F. Rowe, owners of the C. F. Rowe & Bros. Co., to pay a fine of $25 and costs, following a hearing of charges filed against the company by State Mine Inspector F. W. Cunningham. It is alleged that C. J. Rowe, who is superintendent of the Hamilton mines, failed to countersign the weekly mine record books, and that C. F. Rowe failed to keep a fan going at all times, and that he failed to measure the air current and record it, as is required by the state bituminous mine law.

Pittsburgh—The Export Coal Co., on Aug. 10, filed suit against the Fidelity & Deposit Co. of Maryland to recover $11,984.99, said to be owing by the Frank Williams Co., of Buffalo, N. Y., for which the defendant became surety. The plaintiff alleges that in March, 1913, an agreement was made whereby the entire output of the Export Coal Co. was to be delivered to the Frank Williams Co. from Apr. 1, 1913, to Apr. 1, 1914. The Williams company paid for a short time for coal, then became in arrears, and the mine was idle. Small sums were paid now and then, and the mine would work a few days. Finally, on Mar. 4, 1914, the Williams company went into the hands of a receiver.

Charleroi—According to the monthly report of officials at Lock No. 4, more than 13,282,000 bu. of coal passed through the locks during July, a decrease of 3,000,000. In June, more than 17,000,000 bu. were towed through.

WEST VIRGINIA

Glenalum—On Aug. 14 a band of Italian bandits murdered three officials of the Glen Alum Coal Co. who were proceeding from the railway station to the mines, with between $10,000 and $15,000 in the payroll. The Italians escaped to the mountains with this money, but were located by a posse on Aug. 15 and the following day every member of the band was killed. These five men, however, for almost 24 hours, held a posse estimated at 200 men at bay, and were finally dislodged only by the use of high explosives.

Bluefield—Indications are for a general revival of activities in the Virginia and West Virginia coalfield. The mines which have been working half time throughout the summer are daily increasing their working forces, and it is considered but a matter of a few days before practically every operation will be working a full force. The mines affected lie in Russell, Tazewell, Motgomery and Wise countines in Virginia, and Mercer, McDowell, Mingo and Fayette counties in West Virginia.

Charleston—Reports from the Cabin Creek coalfield indicate that the mining and shipping of coal has taken a considerable boom during the past few weeks. It is said that more coal is now reaching the Chesapeake & Ohio main line over the Cabin Creek branch than ever before in the history of this field. The settlement of labor troubles in the Cabin Creek section, and the present European war, are expected to exert a powerful influence toward increasing the output.

Piedmont—Various improvements are being made at the mine of the Davis Coal & Coke Co., of Beryl, which has been idle since June 1. The Masteller Coal Co., with mines located at Hampshire, has completed another opening, which will give employment to about 45 or 50 men and further increase the present output.

KENTUCKY

Earlington—It is announced that the Victoria Coal Co. will develop an additional coal mine near here and will sink a 300-ft. shaft.

Louisville—The sale of the assets of the Central Coal & Iron Co., held a few days ago, was a part of the re-organization plans of that company, according to J. H. Small, secretary. Mr. Small is quoted as saying that the plan has nothing to do with the projected large merger of coal concerns in the western part of the state. Detailed information as to the re-organization plans is not yet available.

OHIO

Athens—One of the few suits filed as the result of personal injuries since the workmen's compensation law went into effect in Ohio was brought at Athens, recently, by the administrator of the estate of Fred Kaplar, the Manhattan Coal Co., of Nelsonville, being the defendant. Damages of $10,000 are asked. It is alleged that Kaplar was employed as a motorman in Mine 36 of the company, and that he was killed by a fall of slate on Oct. 29, 1913.

Congo—State Mine Inspector J. M. Roan and a number of deputies have arranged to open the Congo mine of the Sunday Creek Co., which has been sealed up for nine months because of fire. It is believed the fire is extinguished.

Wellston—The tipple and power house of mine No. 9 of the Superior Colliery Co., located near Wellston, were totally destroyed by fire recently. Burning embers dropped in the shaft and for a time threatened the mine but prompt work on the part of employees and mine inspectors saved it from burning. It will be two months before the mine can again be operated.

Massillon—After an idleness of four months and a half work has again started at the mines of the Peacock Coal Co. in the Massillon field. It is expected that practically all of the mines in that field will be in operation soon.

INDIANA

Terre Haute—A conference was recently held here to discuss the advisability of uniting the bituminous and block miners into one organization. Strong opposition developed There are about 21,000 bituminous and 1500 block miners and the latter are decreasing rapidly, with the exhaustion of the supply of block coal.

ILLINOIS

Zeigler—In removing the debris from the air shaft after a fire at the mine here, the body of one of the employees was found at the foot of the air shaft, in three sections. It is supposed that the man was trying to escape up the shaft and was overcome by the smoke and fell to the bottom, where the refuse cut and burned through his body. The local mine seems to be unfortunate, for only a week or so before the air shaft fire a fly wheel burst, not doing any damage to the property, however, with the exception of the engine house roof. Work has now been resumed.

Marion—Reports from all points in the southern Illinois mining field and as far north and west as Sparta and throughout Herrin, Jackson, Williamson and portions of Saline counties, are to the effect that several of the mines have had to rely upon the railroads to haul them a sufficient supply of water to operate the property. In some sections of the southern Illinois mining field there has been no rain for over three months, and all the ponds, lakes, streams and wells have dried up. Water, in some cases, is hauled many miles

Millstadt—Failure to successfully drill wells deep enough to secure an adequate supply of water has kept the large strip mine here, known as High Prairie, idle since last spring.

Johnston City—The First National Bank of this city has been ordered closed by the bank examiner. This condition of affairs is due largely to bad loans previously made, and the recent heavy demands for cash made by the foreign miners, who are getting ready to return to Europe in answer to the call for reserves from the different countries now at war.

WYOMING

Cheyenne—Wyoming mine operators recently met with representatives of the United Mine Workers in an attempt to adjust difficulties which were submitted a short time prior to the meeting. Chief among the demands made by the miners is the adoption of an eight-hour day from bank to bank, or from the outside to the outside of the mine. They do not ask for an increase of wages, with the exception of the shortening of the actual working time within the mine itself. Furthermore, a few additional safety rules are requested.

FOREIGN NEWS

Halifax, Nova Scotia—As a result of the unprecedented financial situation growing out of the European hostilities, it was recently decided to close a portion of the iron mines in Newfoundland, and the blast and openhearth furnaces at Sydney mines, on Cape Breton Island.

Nanaimo, British Columbia—South Wellington, the site of the Pacific Coast Coal Co.'s mines, six miles from Nanaimo, was recently destroyed by fire. Sixty houses were burned, also three stores, a poolroom, post office, and the Wellesley Lumber Co.'s saw mill. The loss is estimated at over $50,000 with little insurance. The upper works of the mine were not, however, damaged, and work here will be continued.

OBITUARY

Charles L. Hall, of the coal shipping firm of Hall Bros. & Co., and who was especially well known to the anthracite trade, died Aug. 15, at Ocean City, N. J., from injuries received by diving into a tank. He struck his head and died as a result of a fractured spinal column. Mr. Hall was 46 years of age.

Geo. L. Miller, of the Kettle Creek Coal Mining Co., died Aug. 12, at his home in Westport, Penn., of meningitis, superinduced by an affection of the heart. Mr. Miller was prominent in business and political circles. He was the Republican candidate for Assembly in 1912, and was elected State Committeeman from his county at the primary election in May last.

William Forrester, superintendent of the Cameron Coal Co., and one of the most prominent mine operators in Utan, recently died as the result of being struck by a cable while at the Cameron mine. Mr Forrester was born in Scotland in 1868, coming to this country when he was about 20 years of age. His family moved to Utah in 1890 and settled in Salt Lake, where Mr. Forrester has resided ever since. He is survived by his wife, six children, two brothers and one sister.

George Thomas, assistant mine foreman of the Babylon mine of the William A. Colliery, Lehigh Valley Coal Co., and George Cray, of the Lehigh Valley engineering corps were killed on Aug. 12, by a fall of rock. The engineering corps were making a survey of the mine and in their travels were obliged to go into the old workings Mr. Thomas and Mr. Cray preceded the other men in the corp when the fall came. Both men were killed instantly. Their bodies were crushed and mutilated, and it took considerable time to remove the rock. Mr. Thomas was nearly 70 years of age, while Mr. Cray was about 20 years old.

Closure for Retort Coke Ovens. H. Koppers, assignor to H. Koppers Co., Chicago, Ill., 1,099,256, June 9, 1914. Filed July 8, 1913. Serial No. 777,831.

Safety Appliance for Mine Shafts. W. E. Housman and G. E. Huttelmaier, Scottdale, Penn., 1,100,184. June 16, 1914. Filed Sept. 10, 1912. Serial No. 719,686.

Blower for Boilers. T. S. Waller, assignor to Diamond Power Specialty Co., Detroit, Mich., 1,100,165. June 16, 1914. Filed Mar. 14, 1912. Serial No. 683,893.

Fastener for Sectional Coal Auger Nuts. J. H. Wenslick, assignor to Fulton Tool Works, Fulton, Ohio, 1,099,224, June 9, 1914. Filed Apr. 7, 1913. Serial No. 759,287.

CONSTRUCTION NEWS

Windber, Penn.—The Lochrie Coal Co. has a force of men working on its new mine opening at the Manges farm near here.

Hazleton, Penn.—G. B. Merkle & Co. have given the contract for the erection of a new breaker, to cost $60,000, to Wheeler & Reilley, of Wilkes-Barre.

Indiana, Penn.—A contract has been let for the construction of 5 miles of railroad along Yellow Creek from Homer City. This spur will connect a new opening with the Pennsylvania R.R.

Mt. Carmel, Penn.—Ground has been broken for the concrete foundations of the new breaker of the East Bear Ridge Coal Co., which is controlled by James Bros., of Mahanoy Plane

Shawnee, Ohio—The Hanna-Essex Coal Co., of New Straitsville, Ohio, has started to rebuild the tipple at the Shawnee mine. When completed the capacity of the operation will be increased to 600 tons daily.

Pekin, Ill.—The work of rebuilding the Wolschlag mine across the river from this point has been started. This structure burned two months ago. The new buildings will be of concrete and steel, and fireproof. The work will be pushed as rapidly as possible, and an effort made to get the mine completed for the winter season.

Chattanooga, Tenn.—A 20-acre tract in Alton Park has been accepted by representatives of the Durham Coal & Iron Co. as the site for the projected million dollar byproduct coke plant to be constructed here. Control of the property will be vested in the Chattanooga Gas & Coal Products Co. Lewis T. Wolle has been representing the interests of the promotors of the proposition

Lackawanna, N. Y.—Construction work on the new coking plant of the Buffalo Coking Co. at this place has been stopped, on account of conditions in Europe. Several hundred men have been laid off, and operations suspended indefinitely. This plant, which was being built by the Otto Coke Oven Co., was to be employed for supplying gas for the operation of the steel company's furnaces. It was to have been completed within the year, and would have employed three or four thousand men.

NEW INCORPORATIONS

Ft. Wayne, Ind.—The Evans Coal Co. has increased its capital stock $5000.

Seattle, Wash.—The Table Mountain Coal Co. has been organized with a capital of $200,000. The incorporators are Gustov A. German, E. A. Grunden, and Clara Cornell. Leon W. Bernard is the attorney for the firm.

Nashville, Tenn.—The Galloway-Eberhardt Coal Co. has been organized in Shelby County, with a capital stock of $30,000. The incorporators are Chas. S. Eberhart, June H. Rudisill, Carl S. Page, Charles S Eberhardt, Sr., and Samuel Schloss.

Fairmont, W. Va.—The Fairmont Rail & River Coal Co. has been incorporated with a capital stock of $300,000. The chief works will be in Marion County. The incorporators are Thomas S. Neptune, Ernest R. Bell, R. O. Nuzum, H. W. Alford, and Frank J. Wilfang, all of Fairmont.

St. Clairsville, Ohio—A number of Bellaire people recently received permission to incorporate as a company to be known as the Elkins Coal Co. The capital stock will be $10,000, divided into 100 shares. D. A. Elkins, L. E. Long, Alexander Gibson, Charles and Guy Dankorth, are the incorporators. All are from Bellaire.

INDUSTRIAL NEWS

Stewartsville, Ohio.—Several representatives of the Pursglove Maner Coal Co. have made a thorough inspection of the company's mines located at Stewartsville and Glencoe.

Columbus, Ohio—The Little Miami R.R. Co. has applied to the Ohio Utilities Commission for permission to issue $306,500 in guaranteed stock for the purpose of making needed improvements on its line.

Anderson, Ind.—A contract to supply the municipal light and water plants with coal for one year has been awarded to the Globe Coal Co., Indianapolis, at $1.10 mine-run and 75c. slack, f.o.b. The contract amounts to about $25,000.

Washington, D. C.—Proposed increased rates on bituminous coal from points on the Pittsburgh & Lake Erie R.R. to Wilmington, Philadelphia, and Baltimore, on traffic destined to points beyond these cities, were suspended Aug. 12 by the Interstate Commerce Commission.

Fayetteville, W. Va.—Shipments of coal over the Virginia Ry. during the past fiscal year broke all previous records, being an increase of 13.6 per cent. over the previous year. Compared with the fiscal year ending June 30, 1912, the 1914 tonnage shows an increase of 1,328,711 tons, or 39.6 per cent.

Washington, D. C.—Surface rights to a large part of the 450,000 acres of the segregated coal and asphalt lands of the Choctaw and Chickasaw nations in Oklahoma will be sold in November. Announcement of the proposed sale was recently made by the Commissioner of Indian Affairs.

Charleston, W. Va.—Sixty of the stockholders of the Lackawanna Coal & Lumber Co. have just completed a tour of the property on a special train. Seth, Olcott and Griffith were the principal points visited and at these points thorough inspections were made of the developments under way or begun.

Cincinnati, Ohio—The Chesapeake & Ohio Ry. Co. has filed in the Federal District Court here its petition for an appeal from the judgment of that tribunal awarding to the McKell heirs damages of $125,000, assigning 58 errors as ground for the appeal and reversal. The petition was allowed, and the appeal bond fixed at $175,000.

Columbus, Ohio—The residents of Jackson, Hamden and Wellston, Ohio, have lodged a complaint with the Ohio Utilities Commission against the Hocking Valley Ry. Co., abandoning its interurban service on the 17-mile line, leased by that company. The utilities commission has taken evidence and will announce its decision in the near future.

Washington, D. C.—That a shortage of coal exists on the west coast of Mexico was recently reported by Admiral Howard to the State Department. "Under existing conditions," he states, "with the scarcity of foreign vessels, the supply of coal appears a difficult problem. Even before the European war, no coal could be bought by a foreign battleship.

Philadelphia, Penn.—Two American steamships, the "Berwind" and the "Lorenzo," have been chartered to carry coal from Atlantic coast ports to Buenos Ayres. The vessels have been taken on time charters, and are the first American steamships to carry coal direct to the Rio de la Plata, this condition being made possible by hostilities in Europe.

Portland, Ore.—The Interstate Commerce Commission will be appealed to, it is understood, to adjust the freight rate on coal from the Centralia, Wash. district, to Portland. At present the rate is $1.40 per gross ton, while to Seattle, a similar distance, the rate is but $1. This is considered an unjust discrimination that the railroads should be compelled to remove.

Charleston, W. Va.—Notice was recently received by the state Public Service Commission from the Interstate Commerce Commission, that beginning Oct. 1 next the freight rate per ton on coal from the mines along the Kanawha & Michigan R.R. to Richmond would be $1.65 instead of $1.90. The present rate from the same territory over the Chesapeake & Ohio R.R. is $1.60 per ton.

Toronto, Canada—Sir William Mackenzie, Sir Donald Mann, and other Canadian capitalists, have acquired important coal deposits in Venezuela, and have had them investigated by Canadian government geologists, who report that they are of great extent and high quality. This means the establishment of a coal supply near the Panama Canal and a supply for Brazilian gas plants which are now dependent upon imports from England and Wales.

Philadelphia, Penn.—An interesting feature in the charter market on Aug. 13, was the closing of 10 steamships to load full cargoes of coal at Philadelphia, Baltimore or a Virginia coal port for Las Palmas, Canary Islands, at 20s. This is the first time since the trouble in Europe that steamship chartering became active. In addition to the closing of 10 steamships, two vessels were chartered to load coal at the same port, one for Rio Janeiro at $5.75 per ton and the other for the River Plate at 23s. 6d The shipments to Las Palmas is entirely new business and due to the difficulty in securing English coal.

Pittsburgh, Penn.—The Pittsburgh Industrial Development Commission was recently in receipt of a communication from the American consul at Montevideo, Uruguay, announcing that that government requires about 20,000 tons of coal in two months. Large quantities of fuel are also required for the retail trade, the selling price in Uruguay at the present time being equivalent to $21.70 per ton. The Commission is in frequent receipt of cables from various South American points where American consuls are located, and may become a substantial factor in extending American trade throughout South America.

Springfield, Ill.—The Mine Rescue Station Commission anticipates having an interesting exhibit at the State Fair this year. This will be located in a tent near the main entrance to the grounds, and will include the principal apparatus kept at the stations, such as oxygen breathing apparatus, pulmotors, safety and electric lamps, first-aid materials, etc. A trained team of first-aid miners will give daily exhibitions in the practical application of first aid, and on Friday, Sept. 25, in the Coliseum, will be held the Second Annual First Aid Contest, open to all miners in the state Substantial prizes will be given to the winning teams and the winners in the one-man events.

Coal Trade Reviews

General Review

Business uncertainties have created a sharp buying movement in anthracite. Derangement in coastwise and foreign shipping has seriously disturbed the Eastern bituminous situation. Producers aggresively investigating the possibilities in the foreign markets. Sentiment generally better.

A general uneasiness has developed among anthracite consumers which has created an unexpected and broad buying movement in all directions. Prices are notably firmer, with concessions on the regular circulars confined more particularly to the poorer grades, and the market appears to be easily absorbing the relatively large production now in effect. A feature of the hard coal situation is the persistent demand for the steam sizes, practically all of the current production going into immediate consumption; as a consequence, the fear is expressed in some quarters that the companies will not succeed in accumulating the customary surplus stocks of these grades before the winter trade opens up.

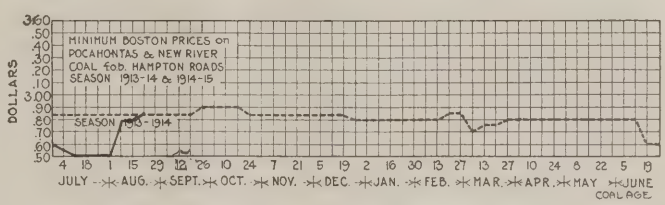
The Atlantic Seaboard bituminous market is much disturbed by the unprecedented conditions prevailing in shipping circles. This has resulted in occasional accumulations of demurrage coal, but the trade has not at any time been actually choked up. In fact, there are complications arising such as car shortages and a slow movement which seem to indicate an impending shortage. Consumers at down east New England ports are already becoming urgent about orders. Water freights will also be an important factor in the situation, and with the government considering taking over a number of steam colliers, there will be considerable tonnage to replace.

Developments in the export business have been of a contradictory nature so far, the Berwind-White Co. supplying the large liners, having been compelled to reduce operations to less than half capacity, whereas other concerns bunkering irregular tramp steamers report such vessels taking coal up to their full capacity in order to have sufficient to last for the round trip.

Interior points are also showing great interest in the possible results of the European war on their markets, but it is difficult to see how they can expect to benefit until districts shipping the Seaboard trade are completely swamped with orders. The results so far in the Pittsburgh district have been of an adverse nature, breaking up a gradual improvement that had been evident for some time; prices are irregular with contracts negotiable on a rather low basis. Production in Ohio is increasing rapidly, and the domestic grades are in good demand with prices well maintained. The Lake trade continues light.

There is a notably improven sentiment in the Southern market, due to the possibility of a heavy export business developing So far the increases and decreases in business have approximately balanced each other, so that conditions remain rather quiet, though the indications of an improvement ultimately are generally accepted. The Middle Western trade also expects to participate in any benefits derived from an increase in the export business, as this will restrict the Western shipments of the Eastern coals. The results so far have been of a depressing nature. The grain movement has been interrupted, with the result that considerable railroad buying anticipated for this time has not materialized.

ATLANTIC SEABORD



BOSTON

Good inquiry for Pocahontas and New River, both off-shore and coastwise; prices firm. Better demand expected for Pennsylvania grades. The only apprehension now is over a possible car shortage. Water freights advance. Anthracite demand picks up and active fall market is in prospect.

Bituminous—Shippers of Pocahontas and New River are beginning to get their bearings with regard to fall business. The volume of coal on cars at Hampton Roads is still very large but there is a lot of inquiry for off-share loading 30 and 60 days hence. There are few now who do not look for a strong active market before we are far into October. The announcement last week that the West Atlantic is safely open to English, French, and neutral shipping has given a better complexion to the export trade and heavy requisitions are expected soon from points that ordinarily are supplied by foreign shippers.

Coastwise, the $2.85 basis is being very firmly maintained, much to the surprise of tardy buyers who failed to be impressed by the low prices that prevailed in June and July There is a strength to the market that has not been in evidence for nearly a year. The on car prices, $3.69 at Providence and $3.78 at Boston ,are also being held reasonably well, although sales have been light thus far.

All this makes the soft coal interests in Pennsylvania similarly hopeful. If anything like the demand comes that the Southern shippers look for it will mean the bulk of Hampton Roads and Baltimore coals will go for export. In disturbed times, coal always goes to the market that pays and in the event of stiffening prices off-shore New England will almost surely have to look to Philadelphia and New York for supplies. The bunker trade in New York certainly is not slack, as was feared. Quite an amount of business has been closed the last ten days and some buyers are quite urgent about getting coal forward. Several mines that were under curtailment in July are reported now to be on full time.

The Georges Creek grades are sharing the benefits of improved conditions. The shippers are conservative about fall orders and are doubtless well pleased that they did not meet the competition from Hampton Roads that looked so ominous earlier in the season.

Water Freights are notably stronger. Spot rates, 2500 tons or so, Hampton Roads to Boston, have advanced 10c. within a week and some of the transportation people are declining to make rates more than a month ahead. The feeling prevails that coastwise freights will continue to advance with the season. The Government is expected to take over several steam colliers now operating to the coal ports and if negotiations are successful there will be quite an amount of tonnage to replace Schooners, 4000 tons upwards, are now quoted at 70c., Norfolk to Boston ,as against 55c.@60c. Aug. 1.

Anthracite—There are many signs that the fall demand is beginning to set in. The dealers in the cities have their hands full already putting out coal to consumers and the week has developed rather unexpectedly the first run of orders in several weeks. Dealers find their storage needs replenishing and the trade is counted upon now to settle into a satisfactory fall market. Some of the far-sighted buyers are trying to figure out how the anthracite railroads will meet the extra Western traffic that is likely to be thrown at them. This may become a serious problem.

Prices on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.90@1.45	$1.25@1.65	$1.67@1.77	
Philadelphia*	2.15@2.70	2.10@2.90	2.92@3.02	
New York*	2.45@3.00	2.80@3.20	3.22@3.32	
Baltimore*	.....	.....	2.85@2.95	
Hampton Roads*	.....	.....	.....	$2.85@2.95
Boston†	.....	.....	.....	3.58@3.78
Providence†	.....	.....	.....	3.58@3.68

* F.o.b. †On cars.

NEW YORK

Complications developing in bituminous that indicate an impending shortage. Interest centering on export business, though developments so far are of a conflicting nature. Sub-

stantial improvement in the anthracite situation. General buying movement has been started in the line trade.

Bituminous—The soft coal trade is still characterized by many uncertainties. Never before has there been such active investigation or so much inquiry for export tonnages, but business actually closed is seldom heard of as yet. Developments of a constructive nature so far have about been offset by other factors equally adverse. However, it is generally agreed in all quarters that complications are developing, such as the slow movement on the Pennsylvania and car shortages on both the Baltimore & Ohio and the Norfolk & Western, which are usually the forerunners of a general shortage.

Interest is centering around the export and bunkering business, and sales agents are devoting much of their time to a diligent study of the conditions and possibilities offered in the foreign markets. Results developed to date are generally conflicting. The Berwind-White Co., by far the largest exporters at New York harbor, have been exceedingly hard hit by the interruption in Trans-Atlantic travel, and have again been forced to restrict operations down to less than half capacity The Berwind company's business, however, is confined principally to the large ocean liners, which business has been the principal sufferer because of the war. On the other hand, the irregular tramp business is even more active than usual, as vessels of this character are coaling up to the maximum capacity in anticipation of difficulty in obtaining supplies at foreign ports.

Internal conditions are also showing definite indications of improvement. Even though the railroads feel that they did not benefit greatly by the decision of the Interstate Commerce Commission on the 5% rate increase, they have the compensating advantage of knowing exactly where they stand and are able to adopt more definite policies. As a result of this condition, and also no doubt in anticipation of handling large amounts of freight for export, there is a notably stronger buying movement on the part of the carriers.

Certain restricted grades have experienced slight advances recently, carrying them back to normal figures, but the nominal market continues unchanged on the following basis: West Virginia steam, $2.50@2.60; fair grades Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—As a sequence of the general unsettlement in all lines, particularly as regards financing business, an unexpected and gratifying buying movement has sprung up in the line trade that has given a welcome momentum to the hard-coal business. Interior dealers are taking the position that high prices are going to prevail at Tidewater this fall, while at the same time the rural banking interests, being more conservative than the New York institutions, will draw in on credits. As a result of this condition, they are being forced now to buy in self protection.

The Reading Co., which has been working under a heavily curtailed schedule, are reported short of broken coal, though the other large producers, which are in most instances now operating up to nearly full capacity, are able to take care of all surplus orders of this description. Egg coal is notably stronger, selling at concessions of only about 10c., with a few odd lots offered at less. Stove coal continues the leader, and is only sold with certain proportions of egg and nut which has aided materially in maintaining the market on these slower grades.

There is a stronger demand in the line trade for pea coal which is absorbing the total production, and there will scarcely be any surplus of this grade accumulated for the winter trade. Notably better prices are prevailing on the other grades of steam coal, although the off qualities are still offered at low figures. There has been considerably less than the normal stocking of the steam grades.

The strong steady demand in the all rail trade, together with the possibilities of developing some export business for anthracite, has created in an excellent situation at Tidewater. It is believed that a large export business might be worked up for egg and broken coal.

The market is higher, quotations being now as follows:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.00	$4.60@5.00	$4.95	$4.55@4.95

PHILADELPHIA

Anthracite trade showing some improvement. Tidewater business more brisk, and better inquiry locally. Bituminous quiet, with no increased demand, and prices unchanged.

Anthracite—The market is not showing any marked activity, but indications point to an early opening of the fall demand. Sales agents report quite a number of inquiries, and it is understood that business is coming in quite freely for Tidewater shipment. Mining still continues on the short time basis, the market absorbing practically all sizes with the possible exception of chestnut, which continues to pile up in storage. Broken, egg and stove seem to be moving off particularly well, and it is confidently expected that the early part of September will see the dealers in the market to replenish supplies, depleted by the house holders returning from their vacations, and desirous of filling up their bins.

Individual operators still continue to flood the market with offers at reduced prices This refers to certain sizes which are in excess supply, notably chestnut and pea. The prices on other sizes seem to be well maintained, although a substantial order for chestnut would doubtless bring a concession from the circular on the other grades.

Prices at Tidewater are as follows:

	Circular	Individual
Broken	$4.65	$4.65
Egg	4.90	4.80 @ 4.90
Stove	4.90	4.90
Chestnut	5.15	4.65 @ 4.75
Pea	3.25	

Bituminous—The market has been somewhat disturbed on account of the accumulation of coal at Tidewater points, consigned there for bunkering foreign steamers, requiring that this coal be sold to points on the Atlantic seaboard. Some of this coal, being on demurrage has been sold at a sacrifice, but as a rule, the market has been well maintained and it is understood that the situation has now been adjusted. Inquiries are being received here for shipments of gas and steam coals for South American ports, notably the Argentine, where it is reported there is but a three months' supply on hand. Freight rates on vessels have stiffened, on anthracite as well as bituminous. It is almost impossible to charter a vessel for the Southern ports at any rate.

COAL CHARTERS

The "Journal of Commerce" reports the vessel situation as follows:

Steamer chartering was light in all trades and there was no material change in the general conditions of the market. A few boats are wanted for South American and West Indian business, and it is understood that there has been some fixtures of the kind completed, the details of which are being withheld, but they are undoubtedly for coal to South America and for Cuba sugar to New York or Philadelphia. For boats to European ports there are a few scattering inquiries, but nothing of consequence has yet been done. In the sailing vessel market very little was done in chartering, and the only fixture of interest reported was that of a large schooner for a cargo of coal from Norfolk to Seattle, via the Panama Canal. Ample tonnage is available, although it is sparingly offered for charter.

Coal charters have been reported as follows:

Vessel	Nationality	From	To	Tonnage	Rate
Hermiston[2]	British	Virginia	Las Palmas	2927	$4.80
(Neutral)[2]		Virginia	Rio Janeiro		5.75
(Neutral)[2]		Baltimore	River Plate		5.64

[1]Schooner [2]Steamer.

BALTIMORE

War results and possibilities continue the main topic of the trade. Much coal tied up at the piers here. Foreign inquiry heavy, but available bottoms for European shipment short.

The coal trade is still deep in the discussion of the effects of the great European war on the fuel business here. One of the immediate effects is seen in the manner in which coal is piling up at tidewater. At the Curtis Bay piers of the B. & O. and at the Port Covington pier of the Western Maryland Ry., there is much coal a-wheel and on demurrage. As far as possible, shippers caught with this coal, which was

sent to tide for export business and for foreign bunker trade connections. The result has been some sacrificing at tide, and a price list here is largely regulated by the necessity of the individual case.

While the call for fuel Eastward is still poor and prices the same, there is a little better demand reported to the Westward. Three-quarter West Virginia gas was possibly a little stronger, holding well to the dollar mark. Pennsylvania fuels also were selling at a dollar or better for the most part. There is a distinct feeling at the mines that better times are ahead, and there is very little disposition to sacrifice at production points, even though demand is poor. Everybody feels that a vast business is due for American coals to make up for the displaced Welsh product.

Anthracite coals are taking the ordinary late summer course in regard to household. Industrial call is very poor.

HAMPTON ROADS

Coastwise shipments showing some increase. Prices at Hampton Roads remain stationary. Inquiries being received from markets which have heretofore used Welsh coal almost exclusively.

Although there has been no extra heavy movement over the piers at Hampton Roads, dumpings for the week should show up good, as there has been some increase in the demand from New England and a fair amount has been shipped to South America and ports in the West Indies. Perhaps the most significant shipment of the week has been to Las Palmas, as this port receives practically all of its coal from Wales. This shipment will no doubt be followed by others, and it is understood that there are a number of inquiries in the market from other ports which have heretofore been supplied almost exclusively with Welsh coal.

The steamers "Benpark" and "Strathroy" are reported to have loaded for account of the Brazilian Government. Little information, however, is obtainable in regard to this.

So far as can be learned, there has been no advance in prices. The accumulation of coal in the railraod yards is perhaps a little above normal, with a fair amount of vessel tonnage in port and about due. Shippers are in most cases well prepared to take care of any orders which might call for prompt shipment. It is hoped that they will take advantage of any inquiries from markets using Welsh coal exclusively and endeavor to make prices that will hold this trade in the future.

The U. S. collier "Vulcan" loaded about 7000 tons of coal which she will take to Europe for the use of the battleships "Tennessee" and "North Carolina."

Export shipments were loaded for Gibraltar, Canal Zone, St. Thomas, Santiago, Las Palmas, Georgetown, Rio de Janeiro, Manaos and Para. The cargo for Gibraltar was loaded into the S. S. "Kirkoswald" and was originally intended to move to an Italian port, but after the vessel was loaded and held in port for several days, her destination was changed and she cleared for Gibraltar.

LAKE MARKETS

PITTSBURGH

Operations unchanged. War has checked what would otherwise have been a definite improvement. Prices still deeply cut. Prompt mine-run at close to a dollar a ton.

Eventually, the Pittsburgh coal district may experience some increase in demand on account of the war, but not without the districts which normally ship to Seaboard being first actually filled with business. Thus far the effect of the war has been to cause somewhat of a halt in business, forestalling what would otherwise have probably been quite an improvement in the coal trade at this time, as stocks are now about exhausted and manufacturing operations have been increasing. Production in the Pittsburgh district is fully as large as ten days ago, at close to 70% of nominal capacity.

Prices are very irregular, as regards both prompt and contract, and there is little hope that they will firm up until the mines are practically filled with business. Steam coal slack is going in prompt lots at 55@60c. and gas coal slack at 65@70c., though even these prices might possibly be cut sometimes. Desirable contracts for mine-run could probably be placed with some sellers on the basis of $1.15, while prompt lots have gone at less, and down close to a dollar a ton. Even ¾-in. has sometimes sold below $1.15 for prompt lots. Regular circular prices, which are purely nominal remain: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in., $1.50 per ton at mine, Pittsburgh district.

BUFFALO

Some large orders for foreign shipment have been received. Business improving slowly though rather heavy. Anthracite more active than usual.

Bituminous—Trade has not improved to any extent since the breaking out of the European war, but the expectation is that it will begin to pick up before long. With any starting up of export orders the situation ought to be much brighter. One or two large companies with offices here have already received foreign orders which will divert unusually large blocks of coal from this market. On the other hand there are many concerns engaged in foreign trade, or dependent upon it in some way, that are doing little and hence are not disposed to add to their fuel supplies Nobody calls business at all active for this season.

No great amount of coal has been consigned to this market lately and this has helped the price situation. Much of the coal that is offered speculatively is of poor grade and comes from small operations, which have no good outlet. Quotations remain on a basis of $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with Allegheny sizes about 25c. less.

Anthracite—The activity continues greater than ordinarily prevails in August, much of the business coming from Canada. Retailers have begun to feel some alarm over the war situation and its possible effects upon the coal trade; this is also felt to some extent by consumers and a heavy stock of coal is being carried all around. As a rule orders are filled promptly. Lake shipments of anthracite are in steady volume and show no tendency to increase, as there is a good deal of coal on docks up the Lakes. For the past week the shipments were 151,000 tons.

TORONTO

Consumers stocking up to full maximum capacity and business very active.

Since the outbreak of the European war, business has been very active, consumers being anxious to secure supplies before an advance in prices, which is expected at any time. There are ample supplies on hand and consignments are coming forward freely. Quotations are as follows, prices being firmly maintained. Retail—Anthracite egg, stove and nut, $7.50; grate, $7.25; pea, $6.25; bituminous steam, $5.25; screenings, $4.35; domestic lump, $6; cannel, $7.50. Wholesale, f.o.b. cars, three-quarter lump, $3.68; screenings, $2.64

TOLEDO

Better tone to the market and Lake shipping is increasing. Foreign war will ultimately improve the coal business. Expectations of a car shortage.

There is a better tone to the market since the settlement of the wage scales at most of the Ohio mines. With the resumption of work in the Hocking district, there have been many more boats shipping in the Lake trade and conditions are much better than they were, though not up to normal.

Local coal men are taking an optimistic view of future conditions. They predict an increase in prices on account of the European war, although business may be held down some at the outset. It is also pointed out that European economic exhaustion is bound to follow the strains of the wasting conflict and that American products will be called upon. The decision of the government that the Great Lakes are not subject to the neutrality laws has made the coal trade with Canada legitimate. Local dealers are reticent about Canadian shipments, but there are rumors of German questioning of the destination of certain coal now going up the Lakes.

Whatever else may be the result, dealers here are confident about the general betterment of the coal situation. Buying is heavier now than it has been for months past, and prices are holding steady. Pocahontas is still scarce and quotations are very firm. A car shortage is predicted by practically all the local trade. The public utilities commission is already sending railroad traffic men and large shippers a circular advising close coöperation between the roads and shippers to prevent the congestion of traffic.

COLUMBUS

Mining is being generally resumed. The only district now idle is eastern Ohio. Increasing demand for domestic sizes is reported. Fine coal is weak.

Mining is being generally resumed with the exception of eastern Ohio, where the scale has not yet been adjusted. In practically all other districts scales have been fixed up and the output is gradually increasing.

Reports show that there is a good demand for domestic grades. Dealers are buying both for immediate delivery and also for shipment towards the latter part of the month. The price list is generally well maintained and cutting is

becoming less frequent. The stocking season is now at hand and consequently dealers are busy looking after orders. They report a marked preference for the fancy grades such as Pocahontas and West Virginia splints, but on the other hand there is also a good demand for Hocking and Pomeroy coal.

The Steam Trade is rather slow but this can be expected when the business conditions are taken into consideration. Manufacturing is at a rather low ebb and buyers are not inclined to close steam contracts. Some such contracts have been closed recently and sales managers are working on others. The prices are usually the same as last year. There is some stir in railroad fuel contracts but practically none have been closed recently.

The Lake trade is becoming more active as the production increases; some of the larger operators are devoting considerable attention to that department. The Sunday Creek Co. will try to ship 600,000 tons to the head of the Lakes which will be much less than last season. Bottoms appear to be more plentiful now and the docks of the upper Lake ports are free from congestion.

The market for small sizes is very weak, due to the large production of Lake coal and heavy shipments from West Virginia. As a result prices are lower than have prevailed for some time.

Quotations are now on the following basis:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Rescreened lump	$1.60		$1.75	$1.50
1¼ inch	1.50		1.60	1.50
¾-inch	1.20	$1.20	1.40	1.30
Nut	1.15		1.50	1.15
Mine-run	1.10	1.05	1.15	1.10
Nut, pea and slack	0.55		0.55	0.50
Coarse slack	0.45	0.40	0.45	0.40

CLEVELAND

For all the increased inquiry the orders do not actually grow larger. More varieties are being quoted. Only the restricted arrivals are holding the market to its present level.

Railroads brought only about half as much coal into this market over Sunday as they did two weeks ago. The market is able to absorb just about all the coal now on track, but if shipments are increased there will be a drop in prices as there was two weeks ago. All of the coal held over is now out of the way and current receipts are being delivered.

Goshem operators have signed up with the miners on the basis of 50.5c. a ton for machine-mined run-of-mine coal. Mines have not resumed operation to any extent, but clean up work is progressing and operators are quoting 1¼-in. at $1.45; three-quarter, $1.30, and mine-run at $1.20. Slack is quoted at $1.60 to 1.65, delivered. The freight rate to Cleveland is 70 cents.

Hocking producers are holding to $1.60 at the mines for rescreened three-inch lump, $1.50 for 1¼-in.; and $1.30 for three-quarter. The contract business is taking the bulk of the coal being produced and only one company will be out strong for business when shipping is resumed at full capacity.

No. 8 operators are not conducting any further negotiations but the miners are reported to be making arrangements to open the way for further parleying, though nothing has been done as yet.

The Lake trade is all that could be expected with upper Lake docks as heavily loaded as they can be. At Duluth-Superior it is estimated there are 8,000,000 tons of coal. The docks are rated at over 9,000,000 tons capacity but damage by wind last spring has done much toward reducing the storage space.

Quotations are as follows:

	Pocahontas	Youghiogheny	Fairmount	No. 8 W.Va.	Masillon
Lump	$3.60				$3.20
Lump, 1¼ in.		$2.25	$2.05	$2.10	
Lump, ¾ in.		2.25	2.05	2.10	
Egg	3.60				
Mine-run	2.60	2.10@2.15	2.00	2.00	
Nut		2.20			3.20
Slack	2.35	1.60@1.65	1.70	1.60@1.65	

CINCINNATI

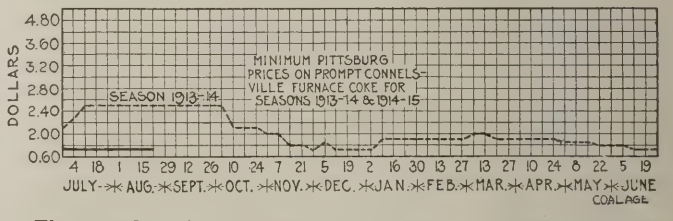
The local market has been strengthened by the stiffening effects of the war. Lake movement continues in fair volume, and domestic deliveries are improving. The steam trade is slow.

With actual deliveries of West Virginia coal reported to be increasing in volume at Atlantic Coast points for purposes connected with the European war, the trade locally has a distinctly optimistic tone. The general opinion seems to be that any change must be for the better. The Lake movement continues free, but small in volume as compared with an average year, due apparently to the large amount of fuel carried over from last season.

In Cincinnati the situation remains practically unchanged, the demand from dealers not having yet developed to any considerable extent, and the normally heavy consumption by industrial concerns being still lacking The retail trade has held off buying later than ever before, moved by the numerous unusual conditions which have affected the market during the entire season. The steam market is awaiting more active business, as it has been for some months. If the expectations of stimulated demand in all lines of business, as a result from the war, are realized, there should be an active demand for fuel soon.

DETROIT

More buying and prices tending towards higher levels. Production restricted down to absolute requirements.



There has been an improvement in domestic trade and the operators are quite optomistic as to the future. Buying has continued at the advance price, effective Aug. 15, and business is about normal for this season of the year. Production is bringing it within the limits of the demand so that the market will not be overcrowded. Much interest is also being shown in the car situation.

The West Virginia districts are getting their share of the increasing business and their circular has advanced to $1.50 on lump and egg and $1.65 on washed nut. Kentucky coals are also higher, $1.75 being quoted on domestic lump, although this is not general, $1.60 being about the average. Some of the smaller producers will also advance their circular about September. There is a steady increase in the demand for coal from the Cambridge and Hocking districts with prices at about the same level as a year ago.

COKE

CONNELLSVILLE

The coke market continues stagnant, the operating furnaces being well covered and the idle furnaces showing no disposition to blow in. Foundry coke is quiet as to prompt lots, practically all the contracting having been done, and shipments are only fair against contracts. Prompt furnace coke is easily obtainable at $1.75, and this figure could doubtless be shaded occasionally. Practically all the operators who were asking $2 on contract for furnace coke have receded from this position and would accept $1.90, if not less, on contracts running through December, but some sellers who never attempted to obtain $2 are now willing to sell at $1.75.

The market is quotable as follows: Prompt furnace, $1.75; contract furnace, $1.75@1.90; prompt foundry, $2.25@2.35; contract foundry, $2.35@2.50, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ending Aug. 8 at 264,070 tons, a decrease of 5505 tons, and shipments at 269,968 tons, an increase of 393 tons.

BUFFALO

The outlook has not improved during the past few weeks and few sales are being made. The inquiry is light for this season and the prospects are not regarded as bright for a resumption of activity in the near future. The market has been weak for some time, although there is practically no change in quotations, which are on a basis of $4.25 for best 72-hr. Connellsville foundry and $3.25 for stock coke.

BIRMINGHAM

There is little to say in regard to the coke situation, other than it seems to be in a stagnant condition, with prospects for improvement at an early date. Very little tonnage is being moved.

CHICAGO

The market is steady and quotable as follows: Connellsville, $4.90; Wise County, $4.75; byproduct egg, stove and nut, $4.85; gas house, $4.25.

SOUTHERN

BIRMINGHAM

Possibility of heavy foreign orders is stimulating local buyers. Improved sentiment in the trade generally.

The market on lump coal seems to be slightly better than last week; many of the retail yards have not yet bought their fall and winter supply, but realizing that should any foreign business develop as a result of the European war, operators will be even more independent and prices are liable to advance; they are, therefore, beginning to feel around, and many of them are placing their orders.

Business on steam coal is just about the same, although the operators are inclined to believe that the next two weeks will see a decided improvement, both in tonnage and prices. While the present business is rather quiet, the general outlook for the fall is good. Many small sales of pig iron are being made, and it is the general opinion that prices have reached the bottom, and will begin to advance. Some little trouble is being experienced, due to car shortage on several of the lines, but not sufficient to materially handicap the operators.

The Tennessee Coal, Iron & R.R. Co. reports the sale of 100,000 tons of lump and steam coal to the Morrison Coal Co., Jackson, Miss., for shipment during the next six months. This is one of the largest individual orders in the South.

LOUISVILLE

Foreign war creating uncertainties in the local market, though the general tone is better. A long war will help the Kentucky trade.

Though the market is showing increased strength, conditions are uncertain, due to the war in Europe. This influence is working both ways, promising an increased demand for Kentucky coals on the one hand and a decerased local consumption on the other. The closing down of the coastwise traffic will divert a great deal of Virginia and East Tennessee coal to the manufacturing establishments which have been deprived of their usual supply, but at the same time the suspension of certain of the tobacco factories and cotton mills will offset this in a measure.

If the war in Europe is prolonged, the Kentucky operators expect to profit largely in the way of increased demand if not through higher prices. Though here and there an operator has withdrawn quotations, prices are substantially unchanged as yet. Demand has been helped by the domestic requirements and the usual late summer stocking movement is under way. In some cases, the demand is reported to be larger than usual. In some markets there is coal on demurrage, while in others there is almost an actual shortage.

MIDDLE WESTERN

INDIANAPOLIS

A slight improvement in demand for domestic grades and more inquiries from factories. No change in prices or running schedule. War developments creating some interest but it is doubtful if Indiana mines will benefit much. Contract season ended.

The only improvement in this section is a better movement of domestic grades, though even this is not up to the expectations. The movement of grain has been checked by the war and an expected larger demand from the railroads has not materialized. There is better inquiry from factories but not much increase in orders. The contract season for the year (or two years in some cases) is practically over. Indianapolis retailers report a good movement from the yards to domestic consumers.

About the only members of the trade that show much interest in the war are the operators and selling agencies of the Eastern mines. These are advised that there is certain to be an export demand for coal that will take prices up, but Indiana operators are not yet sanguine. They believe that little of the coal required for export will come from mines that ship West. Some of the West Virginia coal might be delivered to supplement that from tidewater mines, but it will scarcely decrease the amount going West. For the time being the war seems a depressing factor; exports are cut off and industries affected by this are closing down or running on short schedule.

CHICAGO

General expansion of the Western coal market expected as a result of exportation caused by the European war. Heavy production of Hocking coal and an advance in price is expected.

A better demand is expected in the Western market as a result of the European war. This forecast is based on the conclusion that central Pennsylvania, West Virginia and Alabama will send a great deal of coal into the export trade at least enough to absorb the surplus production in those fields. This will mean the withdrawal from Western trade of a great deal of coal normally marketed here.

Hocking coal is now being produced in large volume and the opening price of $1.50 is regarded as low; an advance of 25c. a ton is expected. Market observers point out that Hocking producers can step into the market heretofore supplied by smokeless coal. The splint coal situation has been rather easy in the West, but there are indications that it will be tight as soon as a free movement into export takes place.

Carterville operators report that the market is firm at the circular of $1.50. Leading Franklin County companies have enough sales at the circular to confirm the advance recently announced. The central Illinois field is centering its attention on the steam trade. An embarassing factor in the situation is the fact that screening prices are going down steadily. An increase in domestic orders has been noted in the Indiana field, due to the harvest demands.

Prevailing prices in Chicago are:

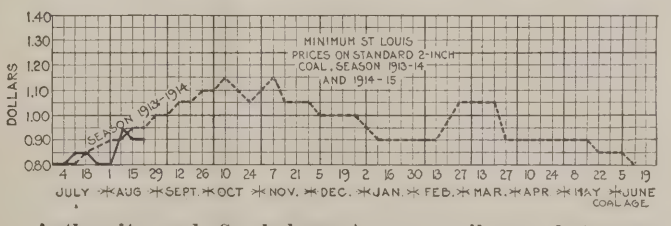
	Springfield	Franklin Co.	Clinton	W. Va.
Domestic lump	$2.07	$2.45@2.65	$2.1@2.27	
Steam lump	1.87@1.92		1.97	
Egg		2.45@2.65		$4.05
Mine run	1.87	2.15@2.25	1.87	3.30
Screenings	1.52@1.57	1.75@1.80	1.52@1.57	

Harrisburg quotations are: Domestic lump and egg, $2.40@2.55; steam lump, $2.25; mine-run, $2.15@2.25; screenings, $1.75@1.80; No. 1 nut, $2.55; No. 2 nut, $2.40.

Carterville prices are: Lump and egg, $2.40@2.55; No. 1 washed, $2.55@2.70; No. 2 washed, $2.35@2.40.

KANSAS CITY

Trade is brisk. Situation relieved by the resumption of mining. Dealers are uncertain as to the immediate future.



The return of the Kansas miners to work Aug. 19 and the consequent resumption of shipments of the Cherokee product to Kansas City, eased the local situation. Trade generally is reported fair, and even brisk by most dealers

The temporary Western slump in production gave opportunity for Illinois shipments here, several carloads having already arrived and others coming. Local retail business is slow, people generally being inclined to hold onto their money as long as possible, and the usual summer business being decidedly less than at this time last year.

ST. LOUIS

The market continues to improve on high grade coals, with the exception of the steam sizes. Demand from the country for lump exceeds the supply. The washed market is picking up on Nos. 1 and 2, but still continues weak on the smaller sizes. Prices on the steam sizes holding better than anticipated.

Everything indicates a sharp advance in the price of lump and egg from the high grade fields. A plentiful supply of cars is now being furnished, but this is only temporary, as most of the shipments are for distant points, and it may be weeks before these cars return for another load. In the Standard district quotations continue at from 85 to 95c. for 2-in. lump and screenings at about 60c. Standard lump in the 6-in. size seems to be the only coal that is going ahead in price, and this is now being quoted at from $1 to 1.10.

Anthracite and Smokeless—An unusually good tonnage of anthracite is coming forward at the circular price, but a large lot is also selling at concessions of from 25 to 40c. There is very little demand for smokeless.

The market is now quotable as follows:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	.....	....	.....	$0.85@1.00	$1.10
3-in. lump	.....	....	$1.30	....	.....
6-in. lump	$1.35@ 1.60	....	1.40	1.00@1.10	1.20
Lump and egg	1.85@ 2.15	$2.25	.....	....	1.15
No. 1 nut	1.20@ 1.35	....	.....	....	.....
Screenings	0.70@ 0.75	....	0.80@0.85	0.55@0.60	0.60
Mine-run	1.00@ 1.15	....	.....	0.75@0.80	.....
No. 1 washed nut	1.40@ 1.50	2.25	1.50	....	.....
No. 2 washed nut	1.25@ 1.35	....	1.35	....	.....
No. 3 washed nut	1.15@ 1.20	....	.....	....	.....
No. 4 washed nut	1.10@ 1.15	....	.....	....	.....
No. 5 washed nut	0.70@ 0.75	....	.....	....	.....

PORTLAND

War in Europe will not materially affect prices in the Pacific Northwest. An increased demand expected, however, because of shortage in slabwood, due to short time operations at the sawmills. No car shortage feared for the present.

While Utah coal advanced 50c. at the mines on Aug. 1 some of the dealers here are still selling at $9 a ton and $9.50 for large lump coal, with the same price being quoted on Wyoming They were able to do this because they placed large orders early in the season.

A small quantity of Japanese coal was imported here this week when the British steamer Fernley delivered a few hundred tons. Some figuring has been done here lately with a view to bringing Japanese coal into the market but the freight rates were regarded as prohibitive. Future business along this line will depend entirely on the freights. Under existing conditions, with vessels tied up by the war nearly everywhere it is felt that bottoms will not be a drug on the market.

PRODUCTION AND TRANSPORTATION STATISTICS

BITUMINOUS COAL MOVEMENT

The following is a summary of the movement of coal and coke over 13 principal railroads during May and the first five months of the last two years, in short tons:

	May		5 Months	
Anthracite	1913	1914	1913	1914
Baltimore & Ohio[1]	107,494	97,003	665,488	633,765

[1] Includes coal from connecting lines.
[2] Includes company's coal.
[3] Does not include company's coal hauled free.
Note:—The Southern Railway hauled 314,203 short tons of bituminous coal during April, and 1,302,171 short tons during the four months.

SAULT STE. MARIE CANALS

Coal shipments through the Sault Ste. Marie Canals for July of the current year were as follows in short tons:

	U. S. Canal	Cana. Canal	Total
Anthracite	375,127	56,066	431,193
Bituminous	1,580,950	287,200	1,868,150

FOREIGN MARKETS

GREAT BRITAIN

The "war spirit" is largely in evidence, and considerable excitement is everywhere noticeable, and more particularly as to its influence upon the coal market. News of the stoppage of the export trade at many ports, and the holding up of steamships, has led to a conviction that in the next few weeks an overwhelming quantity of all kinds of coal will find its way to all the home markets; but, on the other hand, all the merchants are inundated with orders from the general public, and are absolutely unable to deal with the plethora of orders sent in.

The bulk of the merchants report a fair stock of coal in hand, and the delivery trade is now at its height. The War Office, however, have laid hands on a large number of the horses and vans and the motor lories, and this, coupled with the enormous withdrawal of the "Reserve" and "Territorial" men, has had a telling effect upon the depôt work. Colliery prices are all withdrawn, and for the time being only hand-to-mouth prices are available; in every case, however, the prices are higher. From the colliery point of view there seems to be another serious problem to face in the near future; not only the shortage of men, but the shortage of timber for pit props, etc.

On Wednesday's market, when the buying and selling was at its height, the bell rang, and everyone uncovered to hear a short speech from G. C Locket, J.P., the chairman of the Coal Merchants' Society. He stated that the society had had a meeting, and decided under the present circumstances it would be unpatriotic to think of advancing public prices. He admitted that all the merchants had been bombarded with an unprecedented number of orders, and some from householders who never consume more than eight or 10 tons in the whole year, who had rushed in and ordered the whole eight or 10 tons at once. The announcement as to continuing "lowest summer prices" during this remarkable pressure was received with an ominous stillness, but the allusion to the patriotic sentiment, and to the folly of bolstering up the attempt to obtain higher prices, was received with immense enthusiasm.

The railroad companies have given notice that they can no longer take any further consignments to the usual relabelling stations, but that all coal so labelled will be kept at the colliery sidings until final destinations are forthcoming. The ordinary marshalling, or wait-order, stations are already terribly congested, and it is understood that the Admiralty transport department will require all the available area and facilities for the rapid movement of troops, etc. The control of the railways by the government has not been a surprise to anyone. Collieries relying upon the export trade, especially from the Humber ports, will undoubtedly soon have to reduce their output, or close down.—"Colliery Guardian."

FRANCE

In this moment of upheaval, it is naturally impossible to speak of commercial markets at all, since they do not exist for general purposes. It appears quite certain that the French Government has been quietly building up stocks to meet any eventuality, so that the feverish energy required from the armament suppliers will not be checked for lack of combustible. There are, however, very little stocks at the pits, and naturally the production, already vastly reduced, is liable to be stopped altogether in the North of France, although it is less likely to be interferred with in the Center and South, where coal is especially wanted.

As regards Paris, there is no immediate danger of a shortage of coal. The gas and electric lighting companies announce that they have sufficient stock to maintain their normal service for a considerable time—they do not specify just how long—while the retail dealers have sufficient to supply the domestic demand until the end of September.

The production of Béthune during the first six months has decreased from 1,222,510 tons to 987,704 tons, Courrières from 1,560,580 tons to 1,553,656 tons, Dourges from 731,910 tons to 713,960 tons. Drocourt is one of the few with an increased output, improving 9050 tons over last year to 337,430 tons.

There is, of course, no coal market in Paris and no change so far in prices even for retail, only deliveries are very hard to obtain, especially for the "one sack" householder, since most of the carters have gone to the front, and the wagons and horses commandeered for army transport. There is a long train of them passing my office as I write, laden with forage and baggage."—"Colliery Guardian."

COAL AGE

Vol. 6 NEW YORK, AUGUST 29, 1914 No. 9

There is a man at each works of every coal-mining concern who at one time or another sees every one and is personally acquainted with more of the men than the foreman or superintendent. He is the timekeeper.

A man like this, who keeps time, issues store checks, pays off, etc., is the point of contact between the company and the men. In a large sense, he is the personal representative of the company. He transmits the current of ill or good will that permeates the entire organization, and this depends simply on whether he treats the men curtly or courteously. It is through him that rightly, or not, the men acquire their ideas of the company's feelings towards them.

Let us draw a few comparisons from experience and see what part a timekeeper plays in the affairs of a large coal corporation.

A miner goes to the office where a curt timekeeper is in charge. The detail of his yardage earnings is not shown on his pay statement. The amount does not tally with his figures. The timekeeper pays no attention to the presence of the man whom he must know wants information of some kind or he would not be there. The miner waits patiently for a while and finally asks his question.

"All I know about it is what the engineers turned in," says the timekeeper.

"Don't worry me with *your* troubles."

The man goes away with a grouch and it takes him two or three days to see the engineer and get the detail of his yardage—the very data the timekeeper had on his file.

Did the company want that miner treated this way? Did they gain a friend?

At another operation where a courteous timekeeper is employed, one of the men comes to the office. The timekeeper is busy, but not too busy to smile and say "Hello, Jack, what's worryin' you?" The way is paved for the question.

"Sure I can tell you all about it," says the timekeeper and he does it to the entire satisfaction of the man. Did that miner feel friendly or unfriendly toward the concern? We'll leave it to you to say.

This time it happens at a Southern coal mine. Most of the labor is colored and the timekeeper, unfortunately for his company, thinks every negro is a "Nigger." One appears at the window.

"What's your trouble, Nigger?"

"No trouble, Cap'en, only I'se cut fo' de' sto' and yo' know I doan' do no tradin' dere."

"Ain't your name Henry Jones?"

"Yes, suh, but dere's anudder———"

"Well you're cut for the store all right."

"But, Cap'en, I ain't de right man, dere's anudder—"

"Oh, go on and talk to the storekeeper about it."

It took the negro just long enough to do that to keep him out of the mines that day and it was finally found that the stop list showed the charge against Henry Jones, rock-helper, instead of Henry Jones, miner; where the timekeeper entered it.

At another Southern mine where the right sort of timekeeper was in charge the negro was treated differently—like this:

"Hello, Henry, how's your watermelons this year?"

"Dey's sho' good, Cap'en, I'se gwine bring you—"

"What do you want, Henry?"

Henry tells him and in a moment the timekeeper looks over his list.

"You're a rock-helper, ain't you, Henry?"

"No, suh, I'se diggin' in the 14th West."

"Well it's on me, Henry, I cut you wrong this time. Hurry up and catch the man trip and come by tonight. I'll have it all fixed for you."

"Yas, suh! Thank you, suh!"

Henry cut more coal than usual that day simply because he was accorded the kind of treatment the Southern negro likes to have at the hands of his white friends.

Cases like this might be multiplied, but why do it? You have seen and heard everywhere just lots of such dialogues in your own experience. It will be enough to remember that just as sure as the payroll records the earnings of your men, just so sure do the character, temper and attitude of your timekeeper reflect—so far as the men can see—the attitude and spirit of the company. If the curt timekeeper is allowed to remain in charge, can you blame the men for feeling that the company likes his ways and wants him there?

Mine managers and superintendents should not consider that all their time and energy must be devoted to getting out coal, or to welfare work, which latter consists alone in building fences, schools, churches and playgrounds, and then saying, look what we've done for our people! Welfare work without a real moving human spirit is wasted energy.

You can have either a curt or a courteous timekeeper. It's up to you.

Ideas and Suggestions

[*Everyone who has followed the work of* COAL AGE *must be familiar with the paper's policy. We are primarily an engineering weekly. The bulk of matter published is technical in nature. However, there is no doubt in our mind that we are living in an age when present action must no longer be governed by past traditions. We feel deep reverence for all the great men and noble deeds that have set the industries of America on such a firm foundation, but ideas and beliefs must fit the times.*

We are coming to a democracy in commerce and industry just as we have in civil government. As a consequence, the mine engineer, superintendent and manager today have problems to solve, other than those mathematical in nature. No employer can be successful who does not feel a common sympathy for the men he directs. That is why COAL AGE *devotes so much attention to questions of an ethical and sociological nature. We would be doing only half our duty and fulfilling a small purpose if we were to deal with ventilation, pumping and the engineering principles of mining, to the exclusion of all our vital labor questions.*

It is for this reason we urge our readers to contribute articles along the lines of those published here and on the foreword page preceding. Do you know that we will pay as high as $20 for a suitable foreword? Do you know that some of our contributors net more than $500 a year for the writing they do in spare minutes. Perhaps you are fitted for such work. It isn't always the artistic penman or the fellow with a wonderful vocabulary who has a real knowledge of mining.

What we want are worth-while facts, not elegance of expression. We publish COAL AGE *for plain people who are best pleased with plain talk. We invite you to write for us, and we assure you of careful and considerate attention.*—EDITOR.]

The Value of Co-operation and Encouragement on the Part of a Man's Wife or Family

BY PENNSYLVANIA SUPERINTENDENT

Not long ago, a first-grade mine foreman in the bituminous region of Pennsylvania remarked, "I am free to confess that I owe a good deal of my advancement to my wife. If it had not been for her, I probably never would have studied and passed the examination for fireboss, nor would I have had the ambition to go on studying and trying to improve myself so that I could pass the examination for mine foreman.

"Now, mind you, my wife never had much of an education herself. She had to leave school while quite young and go to work. However, she seemed to have the ability to learn, and so when I began to study, she studied with me and often by her encouragement, kept me from giving up and resting content to drive a motor."

Near the same town in which this mine foreman lives, there is a young technical graduate, recently married, who is starting in at the bottom to work his way up in coal mining. His wife, also a college graduate, takes the keenest interest in the mining journal he receives, and usually she reads it each week. Her questions and requests for explanations of some of the articles she does not understand, often cause her husband to investigate something helpful and interesting that he has overlooked in reading the paper, and frequently to brush up on some technical matter that he finds he does not know quite as much about as he thought he did.

Considering the wide difference in educational opportunities of the persons concerned, these two instances taken together, show the advantages of a man's making the work by which he earns his daily bread of some interest in his home. Even in those cases where a man must study alone at home, a sympathetic understanding by the members of his family of the value of study is of great assistance. Moreover, if a person has the slightest desire to advance himself, a little encouragement will go a long way to fix his determination.

The value of study of any character is entirely dependent upon its being earnest, kept up at regular intervals and for definite periods of time. This is much more easily accomplished when a man has the coöperation, or at least the interest of his wife. The value of this coöperation has been demonstrated in many cases. Isn't it worth trying in a great many more?

Co-operation of Mining Factors

BY I. C. PARFITT*

The success of the coöperation of mine officials and employees in the solution of industrial problems by the submission and discussion of theories, facts and practical suggestions, will depend upon the amicable relations of the different elements and the degree of personal interest with which each is actuated.

I have always maintained and advocated that the more friendly the personal relations between the workmen and the officials, the greater will be the efficiency of the productive organization, but to establish such relations there must be mutual concessions.

THE COAL MINER HAS BEEN REGARDED AS AN INFERIOR BEING

The coal miner, from the establishment of the industry until the present time, has been regarded by his contemporaries as a being, mentally and morally, of an inferior species of humanity. That such a conception is erroneous, the true standard of humanity will verify, and its authenticity cannot be strengthened by any appeal to the fallacious theory of caste.

The prevalence of such an opinion arose from the social isolation necessitated by the nature of his labor and

*Jerome, Penn.

the retrogressive results of compulsory associations of a class whose standard of superiority was the measure of brawn and not brain.

Intellectual growth, except within very prescribed limits, was impossible to a class of people so situated as to be excluded from contact with culture and refinement, except what was intuitive, and who had the fact impressed upon them, in no equivocal terms, that the attainment of such was impossible because nature had not endowed them with the faculties required for such acquisition, but had designed them to be the vassals of a superior caste. It was urged upon them that to aspire after a higher mental and moral life, would be a violation of the dispensations of an all-wise providence.

While such conditions never existed in the United States in the same degree as they did in the countries of the old world, because the practical democratic principles of theoretic equality will not recognize the existence of any such distinction, yet they practically exist in such a degree as to form the chief barrier to the coöperation of employer and employee on the basis of an equality of rights and a mutuality of interests.

That this statement is not based upon any hypothetical or theoretical assumption, may be readily verified by any one who will take the trouble to investigate the ulterior motives that have actuated the opposing forces in our great industrial conflicts; the one has been dominated by the nonrecognition of rights; the other by the nonrecognition of superiority.

These motives can be made nonantagonistic only by a demonstration of the fact that the actual and vital interests of the two elements are mutual. The suggestion under consideration is a step in the right direction for the ultimate establishment of such a desirable sentiment.

The Motive of the Average Employee and Average Employer Is Purely Selfish

The ordinary worker does not recognize the pursuit of his occupation as a means to a universal end, but as a task that it is incumbent upon him to perform in order to maintain his physical well-being. His interest, so far as he has any, is limited to the compensation he receives for his services. He does not and cannot regard it as a means by which he may be enabled to cultivate his talents or display his genius, because he does not recognize the fact that his interests are the same as those of his employer. His motive is purely selfish. Labor performed under the incentive of such a motive, never has nor ever will, conduce to individual or collective happiness and industrial welfare.

To be a potent beneficial factor in coöperation, he must concede the same skill, perseverance, industry and honesty of purpose to his work as he would if it were his own individual undertaking.

The average employer, likewise, does not regard the business he has established as a means to an honorable and praiseworthy end, but simply as a medium through which he can utilize the labor (capital) of others for his personal aggrandizement. Primarily, he is actuated by the desire to accumulate wealth, and thereby come into the possession of power. His motive is also purely selfish.

He cannot be actuated by any other because he does not recognize the fact that his investment is only one-half, and the less substantial half of the combination. He fails to perceive that the interest of labor is equally as important to the existence and continuance of the industry as that of capital and that it should receive the same recognition. Such a business is a partnership of antagonistic interests, if I may be permitted the use of such an expression, and exists only by the operation of a mutually selfish principle.

The employer must acknowledge and concede the equality and rights of the means he employs.

Benefits of a Mutual Agreement

Leaving the ethical aspects of the subject and considering only the benefits that may accrue, from a strictly business standpoint, it is evident that the interests of both factors, though mutually selfish, may be materially benefited by a mutual discussion and agreement upon plans whose execution will result in increased stability of operation and financial returns. The employer will be benefited in an increased scope for the employment of his managerial and executive abilities by securing a more thorough knowledge of the technical and practical principles involved in the methods of operation.

He also obtains a more intimate knowledge of the general characteristics, mental caliber and executive abilities of his employees. That such knowledge is of inestimable value to an employer in supplying him with positive data as to the possession of the requisite abilities of those to whom the management of the operation must be entrusted, and in enabling him to select the most suitable, cannot, I think, be questioned.

The recognition and appreciation of the employee's abilities, even if it be only a verbal acknowledgement, tends to establish and nourish confidence and self-esteem and raises the recipient in his own estimation, making him a more valuable factor in the aggregation. Self-esteem or self-confidence is an absolutely essential element to success. To properly cultivate it is to confer a benefit; to disparage or ignore it is an offense.

In addition to this stimulus, the employee learns to respect his employer since he has condescended to meet him upon a basis of business equality, and there is no better way of breaking down the barriers of distinction and establishing a mutuality of interests than for man to meet man as a peer.

It is a natural law of our being to render more valuable service to one whom we respect than to one whom we fear.

Suggested Precautions

Don't allow men to ride electric locomotives.

Don't fail to protect the trolley wires at cross-overs and partings.

Don't fail to have wires promptly repaired after roof falls.

Don't work on live apparatus if it is possible to cut off the current.

Don't send an inexperienced man to work on or about live apparatus of any kind.

Don't rely upon gloves for protection, unless they are perfectly dry, free from holes, and without metal parts.

Don't handle wires carelessly, just because they are insulated.

Don't travel in the same entry with the trolley wire if you can avoid doing so.

Don't get your explosives near electric wires or in cars near the locomotive.

Don't allow packages of explosives to come in contact with the metal parts of cars.

Don't fail to report when you find that electric wires are down.

Don't install temporary lights; leave that work to the electrician.

A Visit to Altofts Colliery, England

By Samuel Dean*

SYNOPSIS—Altofts is the mine operated by W. E. Garforth. He has made several improvements, such as breaking away from the stepped longwall face, installing disk undercutters and conveyors 260 ft. long. His loaders average 9 tons per day. All the coal is cut in the shale; shale dust is sprinkled everywhere. Garforth believes that American room workings can be made almost explosion-proof.

It is worth while going a long way to visit Altofts colliery. It is here that W. E., now Sir William, Garforth, has blazed the trail that so many coal-mining men have followed. Many years ago the barriers of prejudice were broken down, longwall faces were crooked and worked by what is known as the step system, as shown below.

He made them straight and the coal was undercut with

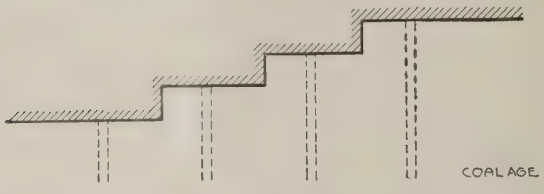

Fig. 1. This Method of Stepping Longwall Is Abandoned at Altofts

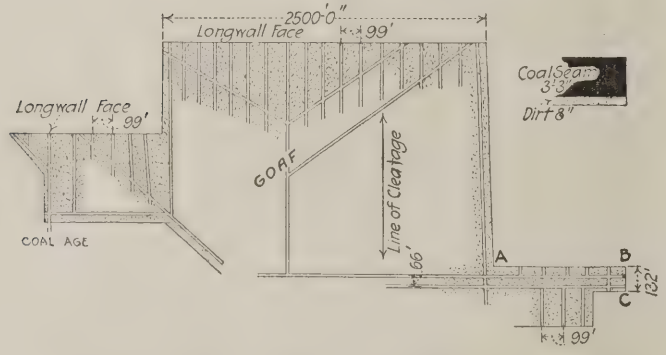

Fig. 2. Garforth's Method of Opening Up a Longwall Face

disk machines. Eminent mining engineers predicted failure, and said that the roof could not be held at the face, and now that success has been secured the roof is declared, in explanation, to be very favorable at Altofts.

Mr. Garforth had his own breathing apparatus (the WEG) patented and manufactured at a time when there were few such appliances in existence. He was one of the first to install a coal-washing plant. He designed and patented his own coal-cutting machines. Coal-face conveyors are used with great success in the thin seams he is working.

And what he has done in the way of preventing explosions and fires in mines is, of course, well known. He can look back upon a career of wonderful success, both scientific and commercial, and on account of his talents and modest disposition, and willingness to give others the benefit of his valuable experiences, he is held in high esteem by everyone who has met him.

*Delagua, Colo.

How Longwall Is Handled at Altofts

Fig. 2 shows the method of working a seam of coal 3 ft. 3 in. thick. The seam lies practically level, and wide bords or rooms, as on the right of the figure, 132 ft. wide, are driven out on the face of the coal with two gateways, set at 66-ft. centers. The space between ribs, excluding the gateways, is packed as tight as possible and there is never any trouble at the face. On the right and left of the bords longwall faces are started. From *A* to *B* shows one of these just opening. It is customary to pack tightly until the first weight has subsided, then spaces can be allowed between the goaf packs. The faces are worked on the butts because more lump coal is produced than when they are driven on the "faces" or parallel with the lines of cleavage. Compressed-air disk machines undercut to a depth of 5 ft. 6 in. in the

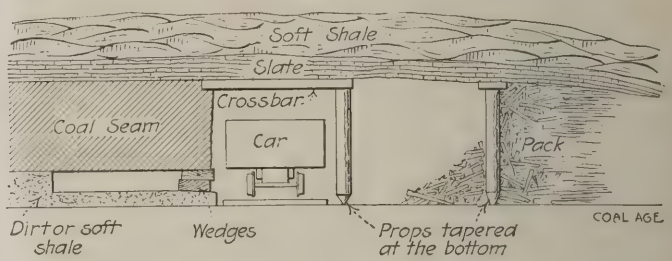

Fig. 3. Altofts Method of Protecting a Longwall Face

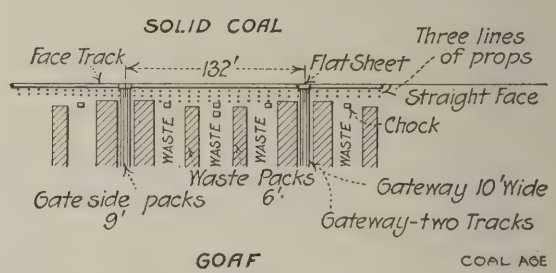

Fig. 4. Straight Longwall Faces at Altofts, Cut by Machinery

8 in. of dirt, and as a consequence there is no "bug dust" and the faces are automatically shale-dusted.

The Unstepped Longwall Face

Figs. 3 and 4 show the method of supporting a machine-cut face in a seam 4 ft. thick at a depth of 960 ft. As stated, the face is perfectly straight, and the timbering is maintained in straight lines. A few chocks of square timber are built, but these, with the props, are all withdrawn as the face advances. The packs are kept up as near the face as possible.

In 1882, Mr. Garforth made the following statement:

> The straight line of face affords the best line of fracture, and by allowing the subsidence of the superincumbent weight to be regular and to fall on the goaf thus taking the pressure from the coal face, working places are seldom stopped by weighting in, and there is less liability to sudden outbursts, as the pent-up gas may be liberated in small quantities and regularly dealt with. ("Trans.," Mid. Inst., 1882, Vol. VIII, page 36.)

And after 32 years his opinion is unchanged.

FIG. 8. SHOWS HOW SHALE DUST RESTS ON PROJECTIONS ON THE RIBS OF THE HEADINGS

FIG. 9. A COAL-DUST EXPLOSION AT THE MOUTH OF THE ALTOFTS TUBE

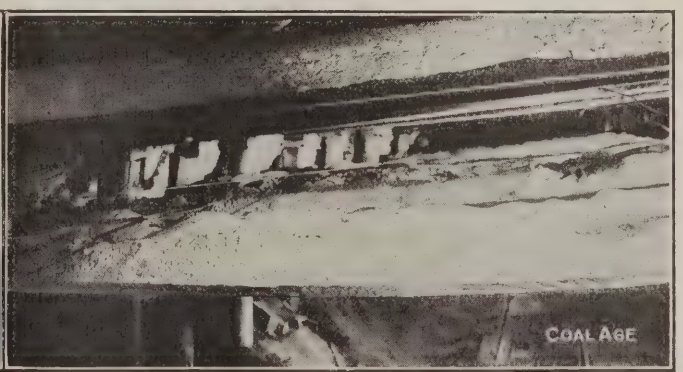

FIG. 10. SHALE-DUST SHELVES SPANNING THE TRACKS IN THE COLLIERY

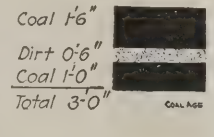
WORKING ON THE BUTTS GIVES BETTER COAL AT ALTOFTS



Further, by working his seams plumb on the end or "butts," or at right angles with the lines of cleatage, he secures the maximum amount of lump coal, so much so that there is a difference of 25c. a ton gained in the selling price over coal worked on the "face." He believes in an undercut running as deep as from 5 to 7 ft.

His miners have loaded machine-cut coal into mine cars, in these thin seams, for as low as 25c. a ton and have obtained higher wages than when working by hand at a much higher tonnage rate. The seams at Altofts vary from a little over 2 to 4 ft. in thickness. It is important in undercutting to remove the coal always to the same depth and not allow the machine to run in and out.

Instances could be quoted where a particular machine has given excellent results in one seam, while the same form of undercutter has caused inconvenience and loss in another mine, until a special machine has been adopted. The height of the undercutting, say in dirt, must be 5 in. or more, so that when the roof sinks the clearance is sufficient to prevent the coal from being wedged or crushed. Sir William favors the use of compressed air underground, but believes there are many mines which can be worked safely and with advantage by electricity. Since he introduced machines with a deep undercut, the use of explosives has been greatly reduced and in some cases abolished.

Why Longwall Is Advocated

He claims the following advantages for machine-cut straight-face longwall mining over the room-and-pillar methods: (1) Fewer men are required at the coal face, owing to the output per man being greater; (2) increased and more regular output per man; (3) less arduous labor by which the safety of the men is increased; (4) better quality of coal; (5) greater tonnage from a smaller area of coal field; (6) saving in timber; (7) reduced cost of production; (8) minimum danger to the overlying seams and surface property by a more regular settlement of the intervening strata, etc. A seam of the section adjacent is being worked with machines and face conveyors.

The machine cuts in the dirt, and the bottom foot of coal has to be shot up. Light charges are all that are necessary, only 2 oz. of permissible powder per 4-ft. hole. The gateways are at 270-ft. centers, the conveyors being about 260 ft. long. The miners or loaders break up the coal, load it on the conveyor, timber the face and remove any rock that may fall for 25c. per ton, and average 9 tons per man. The total output at Altofts is 3000 tons per day.

Coal-Dust Dangers

Sir William Garforth has taken great interest in the subject of the danger of coal dust for nearly 30 years. When giving evidence before the British Coal Dust Commission in 1891, he advised the use of shale dust for the prevention of coal-dust explosions.

Seventeen years later, in 1908, he was asked by the Coal Owners' Association to construct an experimental gallery, and the outcome was the famous Altofts tube, where so many tests were made proving the efficacy of incombustible dust. He based his original opinion on the teaching of nature. When leading the first exploring parties after the disaster in the Silkstone pit in 1886, he noticed great destruction in the haulage ways where there was coal dust, yet where the explosion had traveled roadways which contained quantities of shale dust formed by the feet of men and horses, there was no evidence of damage perceptible.

In some of the traveling ways at Altofts, the shale dust has been lying thickly on the floors for years, and has been raised in clouds daily by the men and horses going in and coming out, yet no complaints have been heard about lung troubles, and some of the old timers must have breathed a lot of this dust every day for many years.

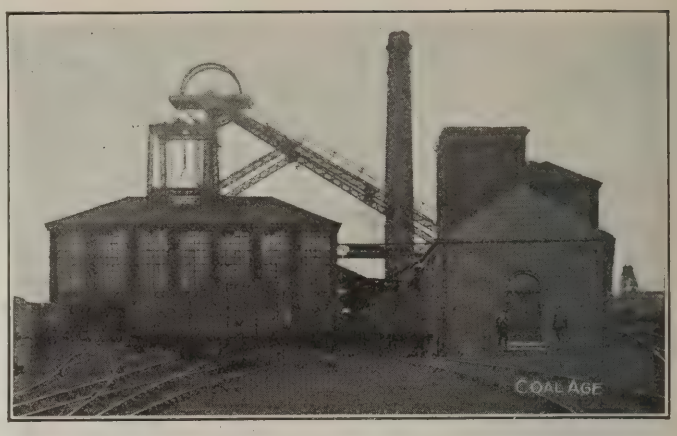


Fig. 11. One of the Shafts at Altofts Colliery

For over twenty years coal-cutting machines have been cutting in shale bands, and the exhaust from the engines and brisk air current has sent this dust along the faces, but it has never caused lung troubles and no complaints have been heard.

Tuberculosis Not Caused by Shale Dust

Occasionally scare heads appear in the mining journals pointing out the dreadful results of miner's consumption on the Rand in South Africa, caused by the inhalation of dust. It is the hard flinty material which causes the trouble, and this subject has been well studied and investigated by the eminent physiologist, J. S. Haldane, who said in 1910 that the dust used at Altofts for stopping coal-dust explosions is from soft shale and is certainly not of such a nature as to cause any anxiety as to the dangers of inhaling it, particularly as the amount inhaled must be small.

During the last six years, hundreds of tons of shale dust have been scattered along the haulage ways, traveling ways and returns at Altofts, but as yet it has not caused lung troubles. The only complaints heard have been from the boys who have done the shale dusting; after six months or a year they have asked for a change, and this could only be expected, as shale-dusting day by day may not be a delightful occupation, no more than is

Fig. 12. Large Quantities of Shale Are Placed on Shelves Hanging from the Roof of the Roadway

sprinkling with a hose in the main intake in the depth of winter.

Excess of Shale Dust

The rule at Altofts is to put shale dust wherever there is coal dust, and in all parts of the workings which I visited there was from two to ten times as much powdered shale as powdered coal. There are many dust-tight steel cars without end doors in use and the coal is not loaded above the top of the car. Before a roadway is treated with shale dust, it is thoroughly cleaned and as much as possible of the coal dust is removed.

I questioned Sir William Garforth as to the possibility of successful stone-dusting under unfavorable conditions. He made his reply and asked for the opinions of his general manager, Mr. Lloyd, and his manager, Mr. Harrison. I give the statement and query as I presented it and a summary of the solution as supplied.

Fig. 13 shows part of a typical room-and-pillar mine, and I made the difficulties as great as possible, stipulating that machines were employed at the face of each

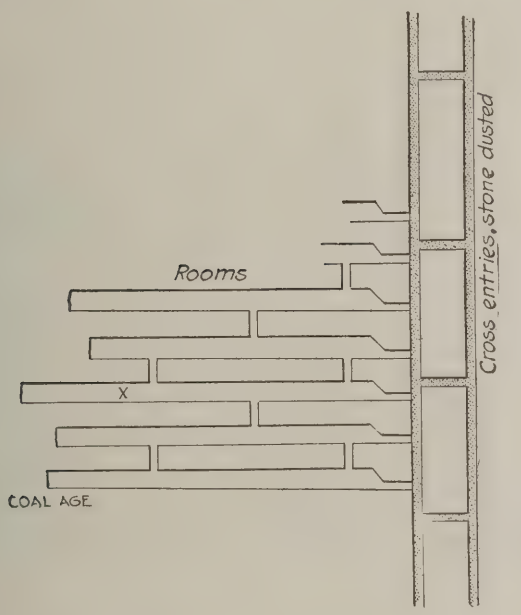

Fig. 13. Typical American Conditions in a Stone-Dusted Mine

room, that these cut in the coal, and that a large quantity of dust was raised which floated about and settled on the floor and projections. I assumed that the cross-entries were shale dusted, and said that there was little difficulty in keeping them in a safe condition, and I think even the opponents of the use of shale dust will agree with me here.

But I know that the opinion is that it cannot be applied at the face, and this factor was what I wanted to get cleared up. I assumed that an explosive mixture had been ignited by a defective safety lamp at the point *X* and asked what should have been done to prevent such an explosion from spreading and causing the deaths of several men?

Stone-Dusting in Room-and-Pillar Workings

Sir William replied that he would heavily shale-dust the crosscuts between the rooms to prevent the flame from spreading from room to room. Mr. Lloyd agreed but added that he would also shale-dust the room necks. Mr. Harrison went further and said that in addition to the crosscuts and room necks he would place as much shale dust as possible around the entrance to each cross-cut, so that a large amount of incombustible dust would be raised at the points so that the flame would, as it were, be nipped in the bud.

The man who ignites the gas, or the man who fires the shot will, in most cases, be killed, and also the men immediately about him. But those great disasters which cause the deaths of hundreds of men can be prevented, by the use of shale dust. By killing the flame we prevent the formation of those poisonous gases which are found in the afterdamp. And as a rule that explosion product is responsible for the majority of deaths in a mine explosion.

Experiments at Bruceton could prove whether the flame could be stopped by heavily shale-dusting the cross-cuts between rooms. I am of the opinion that the crosscuts should be wide enough and high enough to hold shelves.

Some statements having been made concerning the difficulty of shale-dusting large Pennsylvania mines like Marianna, Vesta, etc.; I wish to say that I have not visited any mine in the United States which is more suitable to the shale-dust treatment than Vesta No. 5, and this mine will in all probability be eventually the biggest producer in the country.

Heavy Coke Production in New Mexico

The quantity of coke made in New Mexico in 1913, according to figures compiled by E. W. Parker of the U. S. Geological Survey in coöperation with the Geological Survey of New Mexico, was 467,945 short tons, valued at $1,548,536. This was the maximum record both in quantity and value. Compared with the output of the previous year, it showed an increase of 54,039 tons, or 13 per cent. in quantity, and $191,570, or 14.4 per cent. in value.

All of the coke made in the state is from coal mined in the Raton field in Colfax County. This field is the southern part of the Raton Mountain coal region, which consists of the Raton field in New Mexico, and the Trinidad field in Colorado. The coal measures are continuous, but the producing areas are separated by a high divide near the Colorado-New Mexico line.

Slack coal is used in the manufacture of coke and as over 25 per cent. of total output of the mines yielding coking coal goes into slack, an ample supply for the coke ovens is available. All the ovens in the state are of the beehive type. At Dawson, however, 446 out of a total of 570 ovens, although of the beehive type in construction, are provided with under flues, through which the gases are conveyed to a large passage, back of the ovens, and thence to the power house. The heat obtained from the oven gases renders the use of other fuel in the power plant unnecessary.

This plant in addition to furnishing power for the operation of the mines for ventilation, electric haulage, the coal crusher, washery, etc., furnishes also steam heat to the offices, commissary, hotel, hospital and theater, and electric lights in the city of Dawson.

The Destruction of Forbes

By L. C. Paddock*

SYNOPSIS—Forbes was not protected by mine guards and did not belong to the Colorado Fuel & Iron Co. Yet it was destroyed by the "strikers" before the Ludlow battle. A short description of the incident, mostly in the words of R. Nickol, the superintendent of the mine.

On the 28th day of April about five o'clock in the afternoon an Italian called up his brother at the Forbes mine, which lies about 12 miles northwest of Trinidad, from the union headquarters at the latter place, telling his brother, who is a non-union man, that he had better leave the town because the strikers were going to come there that night and burn up the Forbes mine. Mr. Nickol, the superintendent, said:

"When I received this notice I sent three men to the lower end and three to the upper end of the town to guard the mine buildings, and I put the women into the mine tunnel and sent 12 miners there to protect them; we had no mine guards whatever and had to depend upon volunteers, and I and a few others went to the building where our telephone was stationed. We guarded all night and until about 5:30 in the morning.

"While standing in front of my house a large number of strikers who had taken their position on the hill tops above the mine building and dwelling houses began firing a fusillade of bullets at us and into the houses. These strikers had red bandana handkerchiefs tied about their heads.

A NEW USE FOR THE WHITE FLAG

"Among them was a tall man wearing an overcoat and bearing a white flag. This man seemed to be the leader and from time to time waved the white flag in the air, and as he did this the strikers on the hills fired their rifles; the air was full of bullets. One crashing through the sash went over my left arm; as I stepped into another room another came through the wall blinding me with the plaster dislodged.

"While standing near the door another bullet crashed through carrying splinters into my hands. Over 40 bullets passed through the house while I was there, and how I escaped being killed I do not know. The shooting continued from the miners on the hill tops; I could see the tall man still continuing to wave his flag and volley after volley of shots resounded almost constantly from this hill and from the other hills around the camp and this continued until about 6:45 a. m.; then they seemed to run out of ammunition.

"I then went to the mine tunnel where the women were; they were safe but crying and hysterical. From that point I saw great black clouds of smoke rising from the buildings in the vicinity of the upper portion of the camp. I and others went up there. As I approached it I saw three of the dwelling houses burning, saw the barn and other structures in the upper canon on fire; the air was thick with smoke and the heat was intense.

AS MUCH RUBBLE AS LUDLOW

"As I approached the three dwelling houses I noticed the body of a Japanese; he was lying on his back with his arm over his face. He was dressed in his underwear and had a bullet hole through his breast. This Jap and the others had worked in the mine for about five months.

"About 20 ft further on up the tram track I found the body of Edward Kestler lying near one of the burning buildings. Kestler was lying on his back and the flesh was burned off his legs, his head was burned and his face blackened, his clothes were burned off. Kestler was the mine engineer, about 45 years of age, married and had a wife and two children living in Denver. He had been working at the mine for about a year and a half.

"Next I found the body of Jack Smith, a coal miner. He had a wife and six children. He had been killed by a bullet, had been shot through the right leg just above the knee, his leg was broken and he was also shot through the head. The bones of a Japanese were found in a burning building. The flesh was burned off and the bones were so black and charred you would hardly recognize them as a human skeleton. Back of the rock supply house were the bodies of two other Japanese. Both were dressed in their underwear and each had been killed by a bullet. The substation was on fire.

EVEN THE MULES WERE BURNED

"Then I noticed at the barn there were the bodies of 24 mules and two horses in the places where they were tied, the bodies in every imaginable shape. Three mules and three horses out in an enclosure had been shot. We then went toward the 20-roomed rooming house which was in flames, and near the tipple at the lower end of the mine we found Newman, the blacksmith, lying on his back; all his head above his eyes and ears were shot away; he had been shot from behind by a soft-nosed bullet. His wife was with the other women in the mine.

"I found that all the buildings at the lower end of the town were burning and that the strikers had a fire-setting brigade, the members of which wore white strips of cloth over the shoulders down the front and back so that the strikers on the hills would recognize and not shoot them. After shooting awhile the firing brigade would be sent down by the invaders to set fire to the buildings. Some of the people, both of the men and women, were taken prisoners, and later escaped.

"I will not take time to tell you of the robberies and horrors they underwent. After killing nine people, burning

Body of the Blacksmith Newman after Forbes Attack

A Saloon for Avowed Anarchists at Aguilar, Colo.

*Editor, "Daily Camera," Boulder, Colo.

Note—This article appeared in the "Daily Camera," and we are indebted to that paper for the photographs which we here reproduce.

all the buildings, the 250 strikers marched back in broad daylight into the city of Trinidad."

The character of the people engaged in this ruthless war is well illustrated by the picture of the saloon accompanying this note. It shows a saloon in full blast near Aguilar which is in the same coal field as Forbes. It is known as "The 29th of July Saloon" which is significant as illustrating the temper of the foreign element. This drinking-place was so named because on July 29, King Humbert of Italy was assassinated by a fellow-citizen of the owner of the saloon. To kill those who are the heads of the state is the hope of anarchy. Men could sit in that saloon, drink beer and think of blood. Three times Lieutenant Ray Benedict with a detail of troops pulled down the red flags of anarchy on that drinking house.

The picture we present shows the flags in position prior to the last time they were pulled down. That saloon is now closed by federal orders. Is it too much to hope it will forever remain closed?

Extracts from a Superintendent's Diary

I have lately attempted to get a line on the papers that seem to be the most popular with our miners. Much to my surprise, I find that the honors are about evenly divided between two weeklies that I had not even heard of before. One is a rabid socialistic organ and the other is an anti-Catholic paper, also best described as rabid. A third paper which enjoys some popularity poses as a straight-out weekly newspaper, but its news is sensational in the extreme. Yellow journalism with a few streaks of red and scarlet.

Since discovering these weeklies, I have been reading them in good earnest, not only devouring the current issues, but getting all of the back numbers possible. And this is the opinion I have formed about them: They are simply great destroyers, they everlastingly hammer away at something, either a man's reputation or a company's shortcomings, or a church society's disgrace. They have no desire to build up, apparently it is so much easier to tear down. Furthermore, they attempt to make everyone dissatisfied with one's surroundings, but do not bother about suggesting means of bettering things. Any three current issues read in rapid succession would make the keenest thinker addle-brained. Compared to them, the Police Gazette and dime novels are soothing.

If the average miner has been looking to such papers for inspiration during many years, any overt act of theirs can be easily justified. The miracle is that not more of them are found in asylums.

If one can be convinced that the government is "agin" him; that his employers are "agin" him; that the daily papers are "agin" him; and even his God is "agin" him, what prospect has he of lying down at night to peaceful dreams. And what prospect has any of his neighbors of being able to live near him in peace and quiet.

I recall a statement made by one of our Bank Committee last week and I realize now where he received his prompting. He suggested that any person who was satisfied with his surroundings and refused to resent misfortunes, but considered them as acts of Providence, would soon die of dry rot.

Yet, these weeklies are very anxious that none of their readers should become victims of such a terrible state of mind, and the reason, therefor, is that they depend upon their subscribers' voluntary work for any increases in circulation. They want to excite them to a point where they can't sleep unless they have induced at least one of their fellows to also read the paper.

But the unfortunate part of the entire discovery is that I am powerless to change matters. If I should suggest to any of the men that such literature should be avoided, every man in the camp would hear of it and those who are not subscribers at present, would be annexed to the list immediately.

Possibly some day I'll undertake a small weekly of my own and circulate it in our camp strictly for the benefit of our miners. Perhaps some of our young men might take to my arguments and assist me to reach the old fellows who just now realize so vividly the danger of attempting to live in a peaceful and contented manner.

Recent Legal Decisions

Shipper's Liability for Freight Charges—The fact that the shipper of freight may not be the owner of it does not defeat his liability to the railway company for the amount of the freight charges, unless the company knows that he is acting merely as an agent in making the shipment. (Texas Court of Civil Appeals, Chicago, Rock Island & Gulf Ry. Co. vs. Floyd, 161 Southwestern Reporter 954.)

Construction of Docks in Streets—When a dock is constructed on a river bank at the end of a street without authority having been first obtained from the proper officers of the city, the public will be deemed to have a right of way over the dock to the water's edge. (New York Supreme Court, Westchester County Special Term; City of New Rochelle vs. New Rochelle Coal & Lumber Company; 144 New York Supplement 852.)

Shipper's Responsibility for Injury to Car—One railway company which delivers a car owned by another to a shipper to be loaded, under a joint traffic arrangement between the two companies, can recover against the shipper on account of any injury to the car, caused by negligence on his part or on the part of his employees. (North Carolina Supreme Court, Asheville & East Tennessee Railroad Company, 80 Southeastern Reporter 406.)

Responsibility for Safety of Derrick—Having furnished a derrick of standard make and in perfect condition, for use of employees in handling coal, an employer was not bound to keep it in proper adjustment, to avoid injury to the employees; that duty resting upon them, for whose use it was furnished. (New York Supreme Court, Appellate Division, Third Department; Pierce vs. Atlantic, Gulf & Pacific Company; 144 New York Supplement 330.)

Conjectural Causes of Injury—An employer cannot be held responsible for death of an employee, through coming in contact with a counterweight, used in hoisting a large coal bucket, if it is left wholly to conjecture how he came in contact with the weight. In the absence of proof as to the cause of the accident, the workman having been found dead in the shaft, the court refused to determine whether the counterweight was such "hoist" as is required by the laws of Wisconsin to be safeguarded. (Wisconsin Supreme Court, Hansen vs. Milwaukee Coke & Gas Company, 144 Northwestern Reporter 289.)

Taxation of Mineral Lands—Land granted by the United States to the Northern Pacific Railway Company was conveyed by the company, subject to a reservation in the company of all underlying coal, together with the right to use so much of the surface as might be necessary in exploring for the coal. Held, that the interest retained by the company, while the land remains unexplored, constitutes property taxable as an interest in land; the interest not falling within the provision of the Montana constitution to the effect that "mines," after purchase from the United States, shall be taxed only at the price paid the United States therefor, which in this case would amount to an exemption from taxation. "That several estates in the same land may be owned by different parties is recognized generally. One may own the surface, another the growing timber, and a third the minerals underground, and each estate be subject to taxation." (Montana Supreme Court, Northern Pacific Railway Company vs. Mjelde, 137 Pacific Reporter 386.)

The Purchase of Coal on Specifications--I

By F. R. Wadleigh*

SYNOPSIS—The first of a series of articles that will cover this subject in all its ramifications. This installment takes up the abuses and prejudices common to the B.t.u. system of coal buying. Well defined remedies for these are advanced; other preliminary phases of the question discussed.

Probably the first large contract made in this country for the purchase of coal on a specification basis was that of the Illinois Maintenance Co., who in 1902 bought 20,000 tons on a B.t.u.-ash-moisture basis for use in steam plants of various buildings. The Interborough Co. of New York was probably the first large consumer to buy coal on a strictly specification basis, with premiums and penalties, having put such a contract into effect previous to 1907. The United States Treasury Department adopted this plan in 1906, and its use has gradually spread to all government departments, with the exception of the Navy.

At this date, several million tons of coal are being bought on specifications, and the use of this method is increasing every year, although there is now a growing aversion to it on the part of coal operators and selling agencies. The *London Times'* engineering supplement of 1908 said of the B.t.u. system:

> There are few materials required in our manufacturing and carrying industries which are purchased on a large scale with such a neglect of common-sense rates and precaution, as fuels. The majority of our manufacturers still purchase fuel by this rule-of-thumb method which satisfied the last generation.
>
> A user is not purchasing so many tons of a solid of uniform composition, but should be purchasing so many units of heat in solid form, as a matter of convenience.

Kent, in his "Steam Boiler Economy" (1901), says:

> To buy coal on the reputation of the district in which it is mined is not as good a way as to buy it on a guarantee of quality as determined by an analysis for water, volatile matter, ash and sulphur, but it is the most common way.

Advantages of the B.t.u. Method

These quotations, from two well known authorities, sum up the question briefly and in a general way, but there are many difficult details to settle before we can arrive at a thoroughly satisfactory solution of the whole matter.

The principal arguments in favor of this system of coal purchasing are as follows:

1st—It places all sellers on a similar competitive basis as regards both quality and price.

2d—It enables more sellers to compete, by rejecting trade names and fields, thus broadening the competition.

3d—Systematic and constant analysis of the coal establishes a standard for plant operation and gives more uniform results, often effecting definite savings.

4th—Mine operators are compelled to prepare and mine their coal with greater care.

5th—Disputes as to the quality of coal may be easily adjusted or done away with.

6th—If inferior coal is shipped, the buyer pays only for such quality, while if a better grade than the standard is shipped, the seller gets a higher price.

7th—An exact and definite basis for cancellation of contract is provided for.

8th—By ensuring coal of a uniform quality, the work of the fireman is made easier and more skillful firing is possible.

9th—Valuable and useful information as to coals and their actual quality is acquired by both buyer and seller.

10th—It enables the seller of high-grade coal to get a price commensurate with the value of his product.

11th—It gives to the seller of low-grade coals a chance to compete with the better fuels.

12th—It often results in the adoption of better combustion methods, enabling the power plant owner to use, in many cases, lower grade fuels.

Disadvantages of the B.t.u. Method

1st—It will result finally in making the consumer pay more for his fuel by increasing mine costs and destroying the balance of price between poor and good coals.

2d—It will defeat the principle of conservation of fuel, by operating in favor of the high-grade coals.

3d—Natural variations in coal from the same seam or mines make it impossible for the mine operator to control or guarantee any fixed heating value.

4th—It is impossible for the sampling to be always accurate.

5th—Coal can be sold by the old method with less trouble and expense.

6th—Poorer fuels will not be so much in demand, consequently will remain unmined and often lost entirely.

7th—Greater saving to the consumer would ensue if he would abolish wasteful methods of using coal, instead of trying to save a first cost in buying.

8th—Any saving would be more than counter-balanced by the expense of having chemists for making analyses.

9th—Competitive bidding between coals of different heating values would be restricted.

10th—Sampling is generally done by the buyer; it is impossible for the seller to always have a representative present, and the latter is therefore entirely at the mercy of the purchaser as regards proper sampling.

Preliminary Consideration

The purchase of coal on specifications is a condition as well as a theory; a very practical condition, too, and one that demands careful consideration by both the buyer and seller. Efficiency, the slogan of the day, is required in purchase as well as in use; it should apply equally to both. A sane and impartial viewpoint is necessary in buying more than in anything else.

Too many buyers have looked upon the purchase of coal by specifications as a remedy for their own inefficient methods of use, to be glossed over by using only high-grade fuel, which will give good results, even with the most wasteful equipment and ignorant, cheap handlers. Many specifications are in use that were written from the point of view of the consumer only. They are

*Consulting Engineer, 426 Real Estate Trust Bldg., Philadelphia, Penn.

often loosely drawn up, badly worded, unfair and apparently looking only to getting the best article at the lowest possible price. In addition to this, they frequently leave out entirely, or dismiss in a few words, the most important thing—the sampling of the coal.

To buy coal intelligently on any basis, the buyer must first determine the kind and size most suitable for his particular plant. This can only be accomplished by actual working tests, and should be done before any contract, whether on a specification basis or not, is made.

The most efficient plant operation, at the lowest possible cost, is the basic consideration to the plant owner. As coal is a most important item, its purchase should be given the greatest care both by the one doing the actual buying and by the one responsible for its economical use, whatever may be his position.

No buyer should decide on specifications for coal to be used at his plant until he has considered carefully the following items and determined upon the kind of coal that will best suit his plant and conditions:

Boilers

1—Kind, capacity and arrangement.

Furnaces

1—Grates, surface and setting.
2—How operated, stokers or hand-fired.
3—If stokers, kind of and coal they will handle best.
4—If hand-fired, kind of grates and kind of labor available.

Draft

1—Amount available and how controlled.
2—Kind: Natural, forced or induced.

Load

1—Character; maximum, minimum and time.

Coal

1—Delivery at plant, method of handling, method of storage, how much.
2—Price at mines and freight rates.
3—Capacity of mines.
4—Conditions of delivery and movement from mines to plant.
5—Kind of cars to be used.
6—Moisture and its possible effect.
7—Volatile matter; its relation to furnace condition and smoke laws.
8—Ash; its amount.
9—Fusing temperature of ash.
10—Coking qualities.
11—Skill of firing.
12—Size.
13—Heating value.

What Coal Specifications Should Cover

The true object of the purchase of coal by this method is to ensure the buyers getting, during the life of the contract, the quality and kind of coal needed and a sufficient and uniform supply of it, at a fair price. These should be the main objects of all coal specifications.

To insure this, it should be specified:

1. Period of time covered by contract.

2. Kind of coal, amount needed and method of delivery; a standard analysis, as a description only.

3. The minimum and maximum of each constituent that affects the cost and efficiency of operation of the steam plant.

4. The standard price.

5. The scale of penalties or premiums to be charged up to cost of coal, which should be based directly on the losses sustained in plant operation from an inferior coal or the greater efficiency obtained from a better fuel.

6. The method of sampling to be used at each plant, giving also the amount of coal which each sample is to represent and the name of the person responsible for the sampling, who should be, whenever possible, the chemist who makes the analyses.

7. The method of getting at the final price, which should specify the amount of coal that each analysis represents, as a basis for payment.

One of the most important points about sampling is the question as to who is to do it. It would seem obvious that, as the buyer and seller are both interested, the sampling should be done by an outside party. But, in the operation of most contracts calling for sampling, the work is done by a representative of the buyer, whose chemists also usually make the analyses. To overcome this, there is generally a clause in the contract giving the seller authority to have a representative present when the samples are taken and analyses made.

Unfair Requirements Have Created Prejudice Against the B.t.u. Method

It is manifestly impossible, however, for the seller to always have a man on hand, and the practical result is that, as a rule, both the sampling and analysis are in the hands of the buyer. This is one of the reasons why many sellers object to this kind of contract, and there is no doubt that improper sampling by the buyer, whether intentional or not, has been the source of much trouble and many disputes. Even in the U. S. Government contracts, there have been serious complaints of the sampling methods, notably in the case of the coal bought for the Panama Canal work.

The most flagrant offenders in putting out unfair specifications have been the city and state institutions. As a general rule, they will find that their fuel costs have been higher than they would have been under the old system, as the coal sellers generally anticipated possible losses in their bids. Simplicity in the terms of such a contract should be insisted upon as most important.

The main point to be gained for the specification contract is the general acceptance of the main principle and acknowledgment of its value and fairness. Specifications have been too elaborate and in many cases coal sellers have bid blindly because they wanted the business, merely adding a few cents per ton to cover any possible loss that might be incurred.

Under the old methods, when a fuel has been chosen by a consumer and a contract made for a supply, he has generally concluded that his interests are protected as to quality by a provision that it must come from a certain colliery or collieries and from the same seam. Were this same consumer buying copper ore, he certainly would not consider this as sufficient grounds to insure that the ore would always be of the same value. Nor should such proviso be sufficient for the purchase of coal. That coals from the same seam may vary in quality is fairly well known, but that fuels from the same mine may also vary considerably is not so generally recognized.

Reliable Methods Will Produce Advantageous Results for Buyers and Sellers

As to the attitude of mine operators and selling agencies, opinions today are somewhat divided. Many of the large producers are quite willing to sell on a specification basis, provided they may be assured of fair treatment. Others are against selling on any such contract, and only do so when they cannot get certain large contracts in any other way. On the whole, a decided reaction has set in among coal sellers against the specification basis, and the same may be said about the large users and buyers.

To overcome this tendency, specifications should be so rearranged that the seller will see that it is to his best interest to handle his coal on this basis, and be assured that he will receive what is justly due him for the amount and quality that he supplies.

There is no question that the selling of coal by analysis has tended to make the mine operators more careful in the matter of preparation. Some of the mine owners who are not in favor of this method have issued statements to the effect that they are doing all they can to properly mine and clean their coal, and that selling on an analysis basis would not improve the quality. In some cases at least this has not been true; as a rule, they have given particular attention to shipments sold on specifications, either by selection of mines or by better inspection of the coal.

There has also been a decided tendency to add to the price of coal when bidding on a specification contract, usually from two to five cents per ton; this increase is partly to overcome any additional cost of preparation and partly in anticipation of losses due to penalties for inferior coal.

The first requisite to any universal adoption of this system of coal purchase is the establishment of confidence in the sampling and analyses. At present this is lacking in many instances, and quite often rightly so. This is due to the taking of samples by interested and ignorant employees, and also because the making of calorimeter tests is left to persons not specially trained in its use, whose work could not possibly be accurate enough to use as a basis for payment of coal.

Specification System in Europe

The purchase of coal on a specification basis is much more used in this country than abroad, although applied for years to some extent, and along certain lines, in Germany. It is now in use by a number of companies in England, Sweden, France and Italy.

Recently, the Chemical Subcommittee of the South African Engineering Standards Committee has submitted two valuable reports covering coal sampling, standards for analysis and sizing of coals for commercial use. This report is a valuable and interesting one, going into every detail of sampling and analysis, as well as sizing. Its length precludes printing here in full, but the following items are treated fully:

Colliery Sampling.
Sampling Ships' Cargoes.
Bunker Sampling.
Car Sampling.
Laboratory Treatment.
Moisture, Ash, Volatile.
Sulphur Determinations.
Calorific Value Determination and Details.
Standard Sizing of Coal.

The present status of opinion on the subject in England is indicated by the following editorial from the *Iron and Coal Trade Review*, under date of Mar. 28, 1913:

In another column we publish particulars of the coal contract specification and conditions, which have been agreed upon between the Associated Municipal Electrical Engineers of Greater London and representative firms of contractors in the London coal trade and also approved by the Society of Coal Merchants. As pointed out in our issue of Mar. 7 its most important feature is the recognition of the principle of selling coal in terms of heat units and the adoption of a scale prepared after careful and expert analyses, forming a basis of calorific values upon which business may be done under the new conditions. The seller is to receive a bonus should the coal prove to be above the standard and to pay a penalty should it fall below, in accordance with what is now the common practice in the United States.

It will be noticed also that a standard is given for each class of coal in regard to the percentage of small and that the buyer has the right of rejection if that percentage be too large. Moisture is also included, but not ash, which has been eliminated as superfluous, because a high ash content means decreased calorific value. Sulphur must not exceed 2 per cent., and that, of course, is important, since a high percentage is destructive to fire bars and undesirable in other ways as well.

Under this form of contract no particular colliery need be named, the contractor reserving the right to supply sized coals from any collieries in the districts indicated. This, of course, is a matter of indifference to the consumer since he has his calorific guarantee. The grouping of the districts has been done simply as a matter of convenience and for the sake of brevity. As to the way of taking and testing samples, that is briefly outlined, but we are informed that the whole matter has been put before the Engineering Standards' Committee with a view to formulating a standard system.

Experience alone will show how the scheme will work out in operation, for laboratory analyses are not always a reliable guide to practical results in boiler furnaces. Coal which proves satisfactory at one plant is often the reverse at another, so much depending upon the condition under which it is burned. Sellers will learn in time what prices to charge for the coals they guarantee and competition may be relied upon to prevent the general level being too high. It may be also that the table of standard values will have to be modified in one way or another; but in any case the new specification represents an earnest attempt to provide a practical basis upon which coal can be sold under guarantee.

The Colorado Strike Affects the Coke Output

The output of coke in Colorado in 1913 was 879,461 tons, valued, according to E. W. Parker, of the U. S. Geological Survey, at $2,815,134. The decrease as compared with 1912 amounted to 93,480 tons in quantity and $228,860 in value and was due entirely to the labor trouble and not to adverse trade conditions.

The principal labor disturbances were in Las Animas County, the leading coal-producing and coke-making region; this was responsible for a falling off in coal production of nearly a million tons and the whole decrease in the output of coke.

There are 15 coke-making establishments in Colorado which operate 3588 ovens, all of the beehive type. Six of these firms operating 726 ovens were idle throughout the year. In addition, 980 ovens were idle at plants which made some coke during 1913 so that the total number of idle ovens was 1706 or nearly half the coke capacity of the state. No new ovens were under construction at the end of the year.

According to returns made to the Geological Survey, the average value of Colorado coke advanced from $3.13 per ton in 1912 to $3.20 in 1913. These fluctuations are, however, more apparent than real. A large proportion of the coke produced in the state is made in ovens which are parts of plants including in their operations coal mining, coke making and the manufacture of iron and steel or the smelting and refining of the precious and base metals. For such plants, the placing of a value on the coke produced is an arbitrary matter and does not represent market conditions. Only about 30 per cent. of the total output of Colorado in 1913 was commercial coke.

The complete inclosure of all live parts within substantial grounded metallic outer coverings is the best safeguard against every kind of electrical accident.

The Labor Situation

SYNOPSIS—The eastern Ohio miners are trying to get a sympathy strike in Pennsylvania, but if it occurs the action will probably only extend to concerns mining coal in both states. The Vancouver strike is declared off. The old scale for 35 independent operators and their men in Colorado has been renewed. General scales are now completed for Washington, Oklahoma and Arkansas.

Everywhere in Ohio except in the eastern district, the mines are beginning to produce their normal output. During the past week more mines were put in operation in the Hocking Valley, Pomeroy Bend, Jackson, Cambridge, Massillon and Crooksville districts. Working conditions have proved satisfactory and little friction is reported.

The Ohio Industrial Commission has not yet been asked to decide the question of the percentage of impurities or the proportion of slack allowable in the coal as loaded by the miners. Both problems have been settled by agreement between miners and operators, at least for the time being. A docking system for impurities has been provided and it is working satisfactorily.

Officials Are Opposed to Miners Assembling

The eastern Ohio miners are anxious to return to work. Operators who have mines in that district profess to believe that the rank and file of their employees would return to the mines at almost any scale, but are kept in check by the officials of the miners' organization. The officials are strong in the determination to adhere to the 47c. rate for machine-mined coal.

In fact they have circulated a letter to their following in subdistrict No. 5, informing the members that "certain people, bosses or superintendents" might advise them "to call special meetings and to adopt certain measures in order to end the strike, not for" their "benefit, but for the benefit of the bosses." They urge them not to call any meetings of the local for the purpose of arranging terms of settlement unless they are officially notified to do so by the subdistrict officials. That such a notice as this, which is dated Aug. 15, has been found necessary is a sign that a sentiment for concession is somewhat generally present.

What the Eastern Ohio Operators Declare

The position of the eastern Ohio operators is well defined by Thomas L. Lewis in his Coal Mining Review, and is about as follows:

The miners were to negotiate for a scale in which the price was to be the same as before or else the equivalent of the price heretofore paid. Now the miners have taken this as if meaning that the price paid in Ohio, as a whole, shall be equivalent to that paid, as a whole, in the previous scale, though in different districts the change may give a higher or lower equivalent.

Thus in the Hocking district 72 per cent. of the coal output was paid for. The other 28 per cent. was handed over to the operator without payment. He paid for that 72 per cent., 69½c. per ton, so that it was as if he had paid 50.04c. for the whole of the coal. Similarly the Guernsey district produced 32 per cent. of screenings and hence only 68 per cent. of the coal was paid for. The operator paid 69c. per ton for the sized coal and that was equivalent to a price of 46.92c. for all the miner produced. In the eastern Ohio district the rate was 69½, but the free screen coal rose to 36 per cent., so the miner was paid on only 64 per cent. and the equivalent would be 44.48c.

The Miner Seeking More Than an Equivalent

Clearly, then, the miner in the eastern Ohio district is trying to better his position in making his new contract. Of course, it might give him a higher rate, yet less steady work and consequently small pay,. He is trying, however, that is clear, to get more than the equivalent of the former wage despite the fact that there is now less incentive for him to prepare lumpy coal, and that the companies, even in case of a rigid mathematical equivalent, would be subjected to loss from the change. But it is true that as the joint-scale committee on Mar. 24, 1914, failed to arrive at an agreement, neither miner nor operator is bound to seek the exact equivalent of the former scale rate.

The Hocking Valley Operators Won an Important Concession

On the other hand, the miner in the Guernsey district has been satisfied to go back to work at the mathematical equivalent or its close approximation and the miner in the Hocking Valley district has consented to accept 47c. instead of the mathematical equivalent, which is 50.04c. That is he has agreed to go back for a decrease of 3c. and more per ton or over 6 per cent.

Thus there were parts of Ohio where the miners' demands were not unreasonable, and here an agreement was soon made. But in eastern Ohio an equivalent was not sought, but a better wage instead. We must not forget, however, that the miner has this justification. He has realized that an unequal wage was being paid in Ohio under the lump-coal scale and he has determined to wipe out this discrimination. The eastern Ohio operators have profited by the larger amount of slack which they got without payment.

On the strength of this discrimination, like West Virginia and Tennessee, they have extended their field of operation and now if this difference is removed and wages are equalized, they must be content to occupy a restricted field, and those who work for them will find an almost universal law facing them and that is this: That an increase in relative wage will be more than balanced by a decrease in regularity of employment. Both miners and operators are likely to be sufferers.

The trick worked by the miners has been clever. They used the lowered equivalent in some districts as a pry to help them in others and they promised to make the 47c. rate binding on all districts alike. It remains to be seen whether they will keep their promises to the other Ohio operators or will follow the instructions of the Union as interpreted by the eastern Ohio operators and renew the scale with what the latter deem an exact mathematical equivalent, namely, 44.48c.

Both Miners and Operators Show Little Respect for the Equivalent

It is clear that while the miners are trying to get a rate of 47c., which is 2½c. above the equivalent of the old rate, the individual operators who are seeking to operate without a district scale are trying to pay them only 42½c. and 43c., which is 1½ to 2c. lower than the exact equivalent. In fact, the operators as a body still seem to stand firm on 41.12c. as the price they are willing to pay for run-of-mine machine coal. This is done partly because of the advantage given the Hocking Valley operators by the change, partly to assure against loss from poorer coal, resulting from a run-of-mine scale, and partly so as to put Pittsburgh coal operators in Ohio on a footing more nearly equal with that of the operators mining that bed at Pittsburgh.

The Blockhouse mine of the Dexter Coal Co., at Brilliant, which was operating under the 47c. rate, has been closed down. The receiver says that it was impossible to mine coal at that figure, the coal was so dirty and the rate so high. Of course, there may be other causes, but eastern Ohio operators consider that the failure to operate the mine with success points their moral satisfactorily.

To Strike in Pennsylvania

The miners are anxious to bring pressure to bear on the M. A. Hanna Co., the Youghiogheny and Ohio Coal Co., the Ohio and Pennsylvania Co., and others by promoting strikes at their mines in other states, which are filling the orders which would otherwise be filled in Ohio. The executive board of the United Mine Workers is said to have ordered these strikes, which shows that the board believes a contract is not a contract under certain eventualities.

The operators are anxious to begin producing in eastern Ohio, as their markets are rapidly being invaded by other districts and they fear they may not be able to recover them.

Peaceful in West Virginia

In West Virginia, there has been little trouble. The Four States Coal Co. is expecting that a peaceful result will follow its conferences and has made a temporary agreement with its men. In Maryland, a state not much disturbed by strikes, a small corporation, the Maryland Coal Co., at Lonaconing, has a dispute with its miners. They want 25c. per yd. for removing rock and have gone on strike.

The contract for Oklahoma and Arkansas, in district 21, has been completed by the conference in session at Kansas City. As noted last week, the Kansas contract has also been completed, and the Missouri agreement is practically finished. Thirty-two mines became idle on Saturday, Aug. 22, the men refusing to work without a contract, or quitting because of disputes within the union. It is believed that when the contracts are finally approved by the conventions of the districts on Aug. 31, the men will return to work.

Scales in Washington and Colorado

An agreement has been made in District No. 10, the operators and miners convening in Seattle, Wash. The old scale will be renewed, but the wages of firemen will be increased and free tools will be supplied company miners. The miner's convention will reconvene on the 25th to ratify the agreement. The miners asked for an increase in the mining rate, which they knew they could not get. There is no sense in making demands for the purpose of having concessions to offer. Neither operators nor miners should spar for points. It weakens everybody's faith in the justice of a cause if the parties presenting it habitually ask for more than they can expect.

Another agreement was one in Colorado made between the United Mine Workers of America and 37 independent coal operators. The wage scale was renewed, which had been in effect since Sept. 1, 1913. The operators came from all parts of Colorado, eleven being from the northern field and nine from the Walsenburg district, Huerfano County. Several were from Crested Butte, in Gunnison, and from Palisade in Mesa County. Some came from El Paso County and a few from Routt and Fremont Counties. So the settlement, if not important from a tonnage point of view, covered almost every section of the state.

Federal Troops Likely to Remain in Colorado

Federal troops are apparently destined to long service in the Colorado coal fields. The attempt being made by the administration to accelerate settlement will be found described in the editorial department. Nothing is being done toward reorganizing the state militia, the present numerical strength of which is below minimum emergency figures.

It is said that the European war has made demands upon about one-third of the coal miners in the southern field as subject to military service in the countries affected, but until Bulgaria and Italy mobilize, the statement seems excessive.

Judge Charles Cavender has ruled that 26 strikers, who are charged with murder, committed in the attack on the Chandler mines, Apr. 25, must stand trial. In his ruling, he denied a motion to quash the indictments and set trial for Oct. 5. Each defendant was required to file bond for $4000.

Coal operators of Colorado are issuing bulletins headed, "The Struggle for Industrial Freedom," in which replies are made to false statements that are circulated throughout the nation concerning acts of mine owners and the national guard. Bulletin 12 is a letter written by Governor Ammons, giving a short, straightforward history of the war and covering alleged brutal acts of militiamen and "gunmen." Bulletin 13 deals with the activities of "Mother Jones," as explained by Gen. John Chase, and is a direct refutation of the assertions made by one John Reed, who published, in the July "Metropolitan Magazine," his scurrilous version of the late disturbance as obtained from agitators and their allies. Copies may be had by applying to J. F. Welborn, 720 Boston Bldg., Denver.

In Vancouver, the strike has failed completely. It began May 1, 1913, and cost the Union more than $1,000,000 and now by a vote of the Union, the miners have surrendered.

Franklin Bache Still Undismayed

In Arkansas, the Bache-Denman Co. has desired permission from the court to open up two small mines, the Beck & Keiffer and the Griffith openings, near Prairie Creek. They say the mines can be opened in a few days and at small cost. They are near No. 4 mine, which was so completely destroyed by Union men in the recent riots. The unrest in that section is considerable, as the men refuse to go to work till a definite labor contract is signed. The attempt of Bache-Denman Co. to do anything without federal protection seems futile.

On Aug. 17, Judge I. C. Pritchard, of the United States circuit court of appeals, granted an appeal to the Supreme Court in the case of J. Mitchell, T. L. Lewis and W. B. Wilson, appellees against the Hitchman Coal & Coke Co., appellants.

The three appellees are, of course, past leaders in the United Mine Workers of America. By an opinion handed down on May 28, 1914, they were conceded the right to form a combination to induce miners in West Virginia to become members of the United Mine Workers of America and to secure the highest wages possible by peaceful methods. The Hitchman Coal & Coke Co. contests that right.

The Floodwood Power Station

About Oct. 1 a central-power station located at Floodwood, Ohio, in the Hocking Valley coal fields, will begin to supply current to a number of small municipalities and the coal mines. Later the service is expected to extend to Columbus and other cities of the central portion of the state. Mine refuse will be utilized under the boilers in connection with coal, and all fuel will be free of transportation charges.

An enterprise of this nature has been agitated for a number of years. It took definite form last spring, when Close Brothers, of London, England, took hold of the financing end, through their agent, F. C. Elliott, of Chicago.

Floodwood is a mining hamlet on the banks of the Hocking River, four miles from Nelsonville, the assembling point for rail shipment of nearly all the coal mined in the Hocking Valley. It is the center of some 60 coal-mining operations.

The concern, known as the Ohio Electric Securities Co., has 1000 acres of coal land adjoining the power station Coal will be taken direct from the mines located thereon and dumped into a hopper, passed through a crusher and elevated to bunkers which extend the full length of the boiler room It will then be spouted from the bunkers to the stoker hoppers. The same machinery is to receive the ashes from pits below the stokers and convey them outside or to cars located over the coal hopper.

A modern power house of steel, concrete and vitrified brick is now under construction. There are being installed three 1500-kw. Westinghouse-Parsons turbines, with a continuous overload capacity of 25 per cent. and a 50 per cent. overload capacity for two hours..

Surface condensers will be located immediately under the turbines. Two Alberger corliss dry-vacuum pumps, also the wet-vacuum pump and centrifugal circulating pumps, are to be located in the basement under the power units.

The exciters will consist of one 50-kw. 250-volt turbine-driven and one 50-kw. 250-volt motor-driven set. These are to be located on the main engine-room floor.

In the boiler room the installation will consist of three Flanner water-tube boilers, each normally rated at 627 hp., and Foster superheaters, the steam pressure carried to be 200 lb., with 100 deg. F. superheat. Green chain-grate stokers will be used, and each boiler will be equipped with a Sturtevant induced-draft fan.

Each complete unit is guaranteed and will be capable of being operated at 100 per cent. above normal rating. The boiler-feeding equipment is to consist of one 4-stage centrifugal pump direct connected to a turbine and one 4-stage pump connected to a motor. The feed water will be heated by a 3000-hp. Cochrane heater.

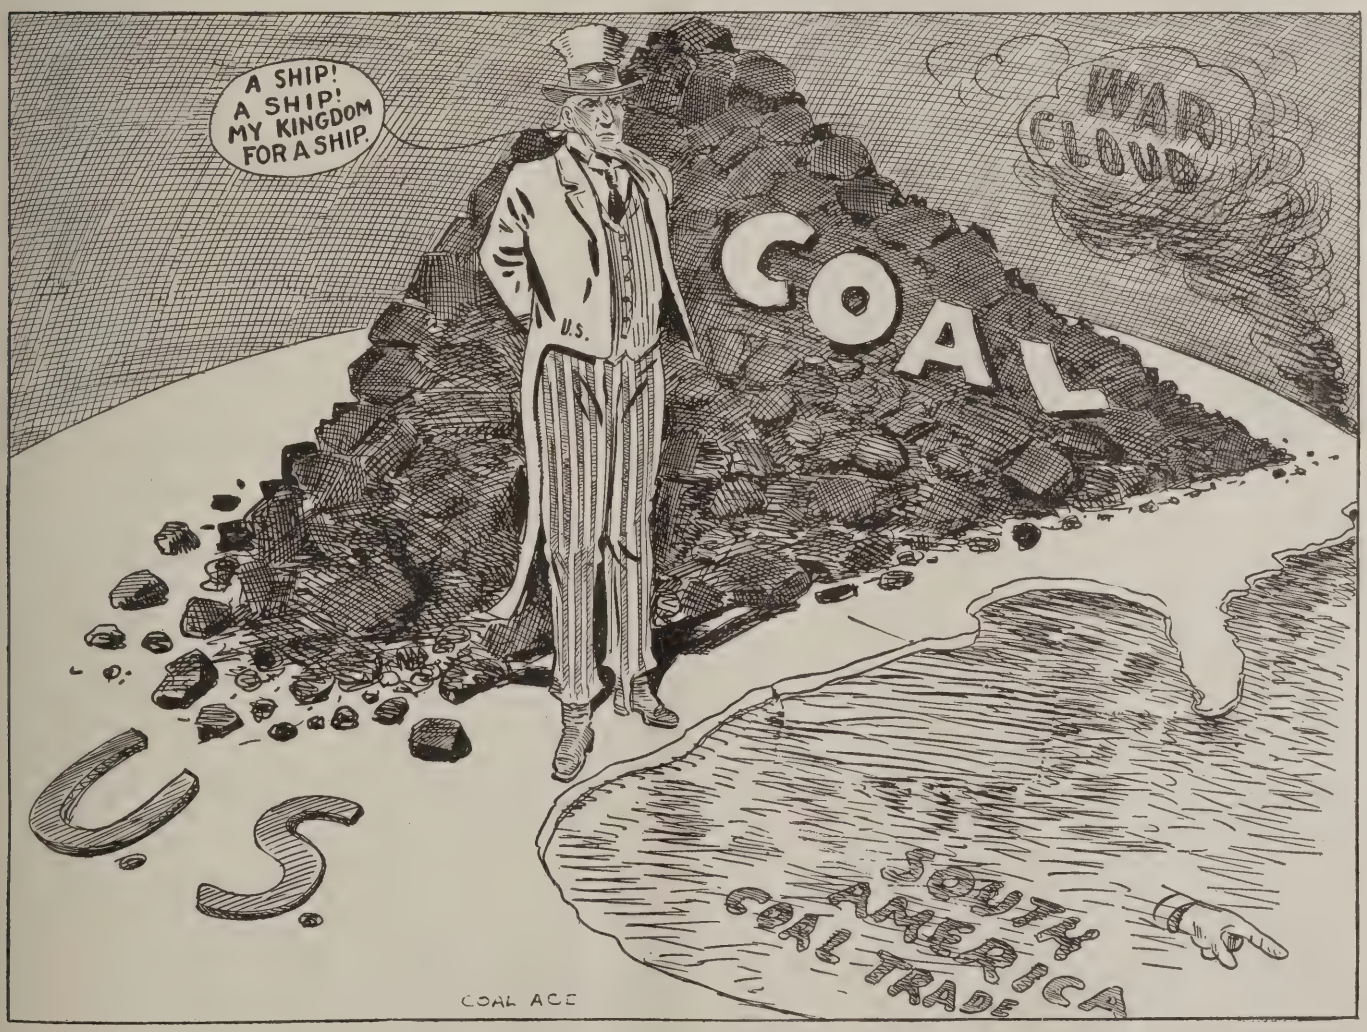
Current is to be generated at 11,000 volts, 60 cycles, 3-phase, and transmitted at that voltage to the mines and towns within a radius of 10 miles, and then trans-

formed down to the operating potential. Beyond the 10-mile limit, the current will be stepped up to 33,000 volts and transmitted at that pressure to the various substations, where it will be transformed down and then distributed. Electrolytic arresters will give ample protection against lightning disturbance.

Provision for Additional Equipment

The entire installation has been planned on the unit system, so that the building can be extended and additional equipment added from time to time as required without disturbing the operation of the plant.

Immediate consumption which awaits the opening of the plant, as now provided for in contracts and business already secured, amounts to over 5000 kw. Municipal contracts, including several county seats, have been signed up for a term of years. A number of mines have also entered into arrangements with the company, and a 15-mile trolley line will be supplied with power.



Within the general territory served by this central station are a score or more of big brick plants, one of which represents an investment of over $500,000. The great abundance of native clay, the deposits of which follow the coal measures, assures the further development of this industry, and will make an increasing market for electric power.

Anthracite Producers Burn Much Coal

An amount equal to nearly 12 per cent. of the anthracite tonnage shipped to market is consumed at the mines for steam and heat. This is shown by the latest report of the Bureau of Mines of Pennsylvania. In 1901 only 9.87 per cent. of the amount of coal shipped was consumed at the mines for these purposes. Ten years later, in 1911, the amount had risen to 11.47 per cent. while in 1912 it was 11.98 per cent.

Reduced to tons and dollars, these figures assume startling proportions. In 1901 the number of tons of coal shipped from the anthracite regions of Pennsylvania was 59,861,650, and the number of tons consumed at the mines was 5,912,900. In 1911 the figures were 79,775,010 and 9,152,073, respectively, while in 1912 they were 73,462,014 and 8,804,759.

Anthracite-coal producers are therefore, among the greatest consumers of their own product. At some of the deeper mines where much water has to be pumped over 25 per cent. of the coal produced is used for steam and heat. In order to operate all the machinery required, 531,289 hp. had to be produced by steam in 1912, as against 526,643 in 1911.

Plenty to Sell, but No Way to Deliver

Who's Who in Coal Mining

Josiah Keely

The Cabin Creek Consolidated Coal Co., in southern West Virginia, is one of the most successful operations in that little mountain state. The corporation as a whole reflects to an advantage the aggressive personality of its general manager, Josiah Keely. Mr. Keely is a "sure-enough" native of the state where his fortunes have been cast, for he was born at Charleston, the capital, in 1874, and received his first degree from the university at Morgantown, in 1896.

Josiah Keely is the sort of man who figures that the attainment of an education requires a life-time of study. It is not surprising, therefore, to find that eight

JOSIAH KEELY

years after he left the W. Va. university with an A. B. degree, he finished work at Harvard, entitling him to a still higher honor in the form of an A. M. degree from that famous seat of learning.

Following the completion of his undergraduate work at Morgantown in 1896, Mr. Keely was appointed principal of the W. Va. Preparatory School, at Montgomery. He continued in this capacity until 1907, when he decided to change his vocation from educational to mining work. Starting in as a billing clerk and payroll man for the Consolidation Coal Co., at Gypsy, W. Va., he soon obtained a valuable practical training in his new line of endeavor, at the same time completing the course of study in mining, outlined by the International Correspondence School.

Serving the Consolidation company for some time in various subordinate positions, he was finally appointed superintendent of one of their mines, which work well fitted him for his next job as assistant to the company's general mining superintendent.

After nine months' service in the last mentioned position, Mr. Keely was made district superintendent for the same company, at Acosta, Penn., leaving this place in January of this year to accept his present employment as general manager of the Cabin Creek Consolidated.

From 1902 to 1907, he was a member of the W. Va. State Board of Examiners. In 1905, he was treasurer of the W. Va. Teachers' Association, and is at present an active member of the W. Va. Mining Institute.

Johiah Keely is a broad-gage man. His early training and work in educational lines fitted him well for specialization in the coal field. Mine managers today must be able to understand something of human nature; they must be able to see and feel from the viewpoint of the man working at the face; they must be practicalists in the art of substituting themselves at all times for the men they direct—Mr. Keely is such a man, for he is the personification of modesty and humanity, with a sprinkling of perseverance to make the combination lasting.

American Mine Safety Association

The annual meeting for the transaction of business, presentation of committee reports, etc., of the American Mine Safety Association will be held at the Waldorf-Astoria Hotel, 34th St. and Fifth Ave., New York City, Monday, Sept. 7, to Thursday, Sept. 10, inclusive, in accordance with the following preliminary program:

Sept. 7—Morning—Meeting of executive committee and of other committees, in accordance with calls of chairmen.

2 p.m.—Address of welcome by city official. Reading of minutes of preceding meeting. Report of executive committee. Adjournment to give committees opportunity to meet.

Evening—Banquet at 7 o'clock.

Sept. 8—Morning—Business session. Committee reports. First-aid demonstration by team from Lehigh Valley Coal Co. Round table luncheon. Subject, "Encouragement of Training.

Afternoon and Evening—Excursion to Coney Island.

Sept. 9—Morning—Business session. Committee reports. Mine-rescue demonstration by team from Delaware & Lackawanna R.R. Co. Coal Department. Round table luncheon. Subject, "Safety Organization."

Afternoon—Visit American Museum of Safety.

Evening—Smoker at 8 o'clock.

Sept. 10—Morning—Closing business session and adjournment.

Afternoon—Boat excursion.

Following the close of the annual meeting those who can are expected to attend the annual mine-rescue and first-aid contest, to be held under the joint auspices of the American Mine Safety Association, the United States Bureau of Mines and the Coal Operators' Association of Indiana, at Terre Haute, Ind., Saturday, Sept. 12, at 10 a.m.

Guests, including ladies, are invited to attend, but will be required to pay for their accommodations at the banquet, smoker and boat excursion. Members will be required to pay for the banquet, but probably not for the smoker or excursion.

W. Hargreaves, a Yorkshire mining expert, says there can be no doubt every prudent and economical mine manager will consider the question of stone dusting at the earliest possible moment, for if ever a cheap form of insurance was put before colliery owners, this is the one. The mining industry will be greatly lacking in a sense of duty if it does not put itself into shape for taking action in advance of anything that may be suggested in the way of legislation.

Editorials

Expansion in the British Export Trade?

It will be a distinct surprise to many of the American operators, now investigating the possibilities of securing a foothold in the world's coal market, to know that England is likewise quietly laying plans for materially broadening the scope of her operations in this field. Germany, of course, has become a heavy exporter in recent years, but with her navy bottled up and acting purely on the defensive, British operators have little to fear from competition in that direction. Belgium is, of course, completely paralyzed by the incessant fighting within her boundaries, while France has insufficient coal to supply her own needs, and is a heavy importer herself.

In addition to this, the internal consumption of Great Britain will be heavily restricted, as a result of the general cessation of industrial plants, which will release large tonnages for use in other directions. It should also be remembered that the countries so far involved in the war take but a small proportion of the British coal exports—in fact, only as much as India and Australia alone. This means that there is still a large market for their production.

On the other hand, Great Britain is at the present time facing a number of severe handicaps, such as the heavy Government bond required on all foreign shipments, and the withdrawal of the Welsh products entirely from this business. It was upon the excellent quality of this latter fuel, considered by many the highest grade of coal there is, that Great Britain has reached her enviable position in the world's coal markets. The fact that it has been withdrawn entirely will now place some of the American fuels, such as, the Georges Creek, the Pocahontas and the New River grades easily in the lead among the fuels available in foreign markets.

Developments in the Export Trade

Among some of the most important developments in the world's coal markets, as a result of the European wars, has been the rigid restriction put upon foreign shipments by all of the countries involved, as well as a number of those still neutral at the present writing. Netherlands has closed down completely on all exports of coal and coke, and Italy has done likewise on foreign shipments of coal. Germany has gone even further, and prohibited not only the exportation, but also the transit, of all raw materials that might in any way be construed as munitions of war, including iron ore, coal, lignite, coke, and briquettes. Decrees have been issued in both Norway and Spain, prohibiting the exportation of coal, coke and mineral oil.

England has, of course, withdrawn her famous Welsh coal from the world's markets, prohibiting exportation even when consigned to neutral powers. Other varieties of the British product are understood to be still moving along certain channels. In this connection the exports of the United Kingdom, the current figures of which have just become available, are of particular interest to American operators. For the first seven months of the current year, the gross exports aggregated 43 million tons as compared with 44⅓ million tons for the same period in 1913.

The exigencies of war conditions have necessitated the adoption of rigorous measures which will severely handicap the British exporters. For instance, the Government now requires that bonds be deposited, aggregating three times the value of the consignments, hoping in this way to eliminate the possibility of the coal being diverted to the enemy. This measure met with such strenuous objection on every hand that it is probable that it may be somewhat modified so that more latitude will be granted consignees, about whom there can be no question as to their reliability.

The situation has been further complicated by financial difficulties involving credits. The English exporters have enormous sums owing them already on past business, and with a general moratorium in effect in all European countries, collections are at a complete standstill. But even in the face of all these enormous difficulties, the American exporter must not entertain exaggerated ideas as to his prospects, for England is still shipping much coal to foreign markets, and will gradually solve all the many problems that are now confronting her.

In view of the importance of the present export business, our next issue will contain a bibliography compiled by an authority on the export trade.

Impartiality

Now and again there comes with a letter of approbation from a reader, a request that we endeavor to be impartial. But it is not true impartiality he desires, but a blind acquiescent neutrality to all points of controversy. There is little use for impartiality of this sort in this world. Only those who take a definite stand for right can ever be successful, especially in the printing of a journal for intelligent and conscientious people. No one desires a wishy-washy defense of practices, which are known to be indefensible and of people who are acknowledged to be doing wrong, nor do they want a journal which avoids dangerous subjects on the ground that they are not technical.

But partiality must always be for the truth and for the right, and not for any special side in a controversy. Either the weaving of halos indiscriminately for opertors or the writing of untrue panegyrics of labor leaders is a type of partiality which is neither ethically nor commercially sound.

We have a mental blueprint which we desire to use as a guide in our framing. We hew with our adze to follow its lines and any chips knocked off other than those thus planned, spoil the whole value of the stick, and every

splinter left in place which the plan says should be removed, must be struck manfully away before the work is complete.

We could reduce the whole timber to kindling or leave it unhewn, but it is not our purpose so to do, and let us hope the blueprint we have made, the purpose of our labors, is as well schemed as it is well intended. To that purpose we are partial and let us hope that to it we will always give our unhesitating adherence. Those who ask us to take another viewpoint, ask of us to be false to our convictions, to make the paper an organ of this or that interest.

And when we hear that word "organ" comes the thought of a deaf man turning the handle of a hurdy gurdy. The tune is nothing to him; harmonies or discordant notes are alike to him so long as the money comes to his hand. We do not think of COAL AGE as the deaf man regards his organ. We want it to play our music, to exhibit our sense of harmony; though, to be sure, when other people would entertain the audience, we do not insist on our ideas of the perfect melody and refuse to them such liberties as we arrogate to ourselves.

The Mailed Fist

Sometimes a constitutional government finds its executive disposed to wipe away with one fell swoop all the protection that the constitution guarantees. In Colorado, the citizens passed sometime ago a law prohibiting the hiring of men outside the confines of the state to replace those who are on strike. Labor is a commodity just as is wheat or bread, but the voters of Colorado believed they could prevent their fellow citizens from buying that commodity in other states. In short, the workingmen of other states who had labor to sell were prohibited from selling it across the state lines. This it seems in itself made the "strike-breakers law" invalid.

But the United States Army has now replaced the state government in the strike districts of Colorado and has substituted its own will for both law and constitution. The following letter to a coal operator, similar to that sent to all union and nonunion operators in Colorado alike, clearly exhibits that the government despite the fact that it has a firm rein in its hands is now disposed to strengthen rather than relax its hold on the rights of the citizens.

In compliance with instructions from the War Department, dated Aug. 14, 1914, the following regulations on the employment of labor will be enforced in this district. Laborers recently hired who do not conform to these regulations will be discharged: (1) Miners must seek work at the mines. (2) Miners must not be gathered or brought in by operators. (3) Miners must be citizens of the State of Colorado. (4) Miners must have complied with the laws of Colorado which relate to miners.

I. WATERMAN,
Lieutenant-Colonel, 12th Cavalry,
Commanding U. S. Forces.

Now the definition of a man "recently hired" is open to question. All men hired since Sept. 23, 1913, when the southern strike started or even since the strike call in the lignite field in Mar. 31, 1910, might be included. The definition might even be put further back. It covers, however, a sufficiently extended period of time to leave in doubt the right to work of a large number of men in the mines, and if in force at the end of the present European war, may prevent any of the men from returning.

The first two rules are not new. They are interferences with the rights of workingmen and operators dating from last summer when the Department of War took charge of the situation. As we have said, they are clearly at variance with the constitution and could only be excused as a temporary measure.

The third rule is new. As perhaps a third of the men now employed in most mining camps especially in Colorado are not American citizens, they cannot be citizens of any of the states. If, therefore, they have applied for work and been hired recently in Colorado, they must be discharged. This regulation applies not only to miners, but to all the men working around the mine, even if they are in a degree skilled laborers. Mine foremen and engineers who are citizens of other states come under this head.

The new ukase, if the word "recently" is made to have a broad definition, will considerably reduce the output of Colorado and even if it is made to apply only to men hired since the rule went into effect, will prevent new men from being employed.

The administration has decided to destroy the opposition to the Union; it has determined to deliver the mines over to the United Mine Workers of America. We believe that the government of this country is not to be used to promote the private ends of any interest. Our good will toward a respectable unionism is not so strong that we believe the army should be invited to lift it into the saddle.

The Purchase of Coal on Specifications

Perhaps there is no single phase of the coal industry in which the practice and opinions have been so entirely contradictory as this much abused question of purchasing coal on a heat-unit basis. Fuel experts and specialists along these lines are generally in favor of the adoption of this method. But among the leading buyers and sellers of the country, there is a great diversity of opinions and the most significant fact is that we find the best informed men among the advocates on both sides.

By far the greater proportion of coal buying in this country is still conducted on the prestige of certain sections, seams or collieries; but on the other hand we find some of the most progressive companies such, for instance, as the New York Edison Co., refusing absolutely to contemplate fuel purchases on anything other than a strictly heat-unit basis. No doubt the abuse to which this system has been subjected, such as impractical specifications and ignorant sampling, supplemented by like analysis, is the direct cause of the bitter opposition which it has encountered in some quarters. Certainly, under these conditions, it may become exceedingly burdensome, if not disastrous, to the seller.

But whatever the merits of the contending theories may be, it has been deemed advisable to present an ultimate analysis of the problem. The initial article appears in this issue under the above title. The series will be written by F. R. Wadleigh, a man who has studied fuel problems in all the leading countries of the world and an accepted authority in this particular line. Discussions and comments from readers on the conclusion reached by Mr. Wadleigh are invited.

Sociological Department

First Annual First-Aid Meet of Utah Fuel Company

By A. C. Watts*

SYNOPSIS—The captains of the teams were not allowed to issue supplemental orders after the work of any team commenced. Two ladies' and one boys' team gave exhibitions of first-aid work. The report goes into detail as to the method of judging the contest. The rating of errors is not that of the American Mine Safety Association, possible demerits totaling only 53 points in 100.

To stimulate interest in, and increase the efficiency of, first-aid work among its employees, the Utah Fuel Co. has organized first-aid associations in all its mining towns. It is the intention of these organizations to educate the employees of the company, both under and above ground, in first-aid and helmet work, and to hold a competitive drill or contest annually at which time the Utah Fuel Co. will provide suitable prizes and medals for the winning team and will assist, in any way possible, to perfect and maintain a first-class first-aid organization at each of its camps. On the 24th of July, known and celebrated in Utah as Pioneer Day, the first of the series of annual meetings was held at Castle Gate, Utah. As this is a state holiday which is always celebrated with appropriate ceremonies, the First Annual First-Aid Contest partook of the nature of a celebration and reunion of old friends. It is hoped that these annual meets will serve to bring the employees of the company into closer touch with each other and establish an esprit de corps among them as well as increase the desire of all employees to learn how to care for injured fellow workmen.

Excursion trains were run from the three main districts, Pleasant Valley and Sunnyside in Utah, and Somerset, in Colorado, and brought large delegations. Altogether about 1500 visitors were present at the event and witnessed the contests. Bountiful and varied refreshments were served to all visitors, and accommodations provided for the convenience of women and children of whom large numbers were present. As the excursion trains rolled in they were greeted by bands of music and salutes of dynamite were exploded on the surrounding cliffs. When all had arrived the delegations marched to the baseball grounds headed by bands and with banners denoting the various teams and towns, and with placards boosting other places for the next meet.

The ball grounds are below the town and in the bottom of the cañon. Instead of the grass-carpeted commons and rolling tree-covered hills of the east it has the yellow clay and the bare, steep and rocky cliffs and sparkling mountain streams of the western mountains, but with the bright colored clothing of the women and the khaki and blue overalls of the contesting miners, the scene presented an equally picturesque panorama. The field for the contests was laid out on the baseball diamond and was surrounded by a rope enclosure, inside of which none but contestants and presiding officials were allowed.

Two rows of nine 12-ft. squares were marked with white paint and covered with brattice cloth. At the back of each row a wire was strung on pipe supports, and pennants having a red cross and the number of each team painted in black on them, were suspended at each square. To insure absolute impartiality in the judgment of events, no company surgeon or officials were allowed to have anything to do with the judging of the contests or allowed inside the enclosure.

The judges were:

Dr. F. R. Slopkanski, local surgeon for the Denver & Rio Grande R.R. at Helper; Dr. J. Dowd, of the Consolidated Fuel Co., Hiawatha; A. W. Dennison, in charge of the Consolidated Fuel Co. Rescue and First-Aid Work; H. H. Sanderson, superintendent, Consolidated Fuel Co., Hiawatha; J. S. Thompson, mining engineer of the Colorado School of Mines.

The supervising judges were: Roberts and Lanza, of the U. S. Bureau of Mines.

J. C. Snow was chief scorer and his assistants were W. R. Johnson, R. Wilstead, G. Conway, J. A. Thorpe, L. R. Evans and A. Elliott, of whom one was chosen timekeeper.

Eighteen teams, each of six men, competed. One man in each team was selected as patient. Castle Gate mines had 3; Winter Quarters, 5; Clear Creek, 3; Utah Mine, 2; Sunnyside, 3; and Somerset, 2 teams; besides which there were two teams of young women from Winter Quarters, and one team of boys under 17 yr. of age from Clear Creek, who gave exhibitions of exceptional skill, although they did not participate as competing teams. The young ladies will be presented with a silver loving cup.

The Squads in Review at the Castle Gate Contest

PRIZE WINNERS

The first prize for the team having the highest total average in all events was a handsome silver loving cup. The winners of the first prize in the separate events were given handsome gold medals, and the second prize winners pocket knives appropriately engraved.

The first prize belongs temporarily to the winning team, but permanent possession is obtained only by the team winning first place three times. This year the first prize was won by team No. 17 from the Castle Gate No. 2 mine, composed of:

Captain R. J. Henderson, American, machine runner; J. Ramage, American, machine helper; J. Wilson, American, driver boss; A. Wardell, American, driver; J. Lakin, English, coal inspector; J. S. Hreinson, American, machine runner; the total score being 216⅔ points.

The winner of the second prize was team No. 7 from Castle Gate No. 1 mine, composed of:

Captain J. Jones, English, mine foreman; H. Mather, English, rope rider; J. Cowan, American, machine runner; J. Yates, English, hoistman; H. Walker, English, driver; F.

*Chief engineer, Utah Fuel Co., Salt Lake City, Utah.

Levic, Austrian, machine helper; with a total score of 210½ points.

The first prize winner in the one-man event was E. H. Holland, of Sunnyside Team No. 2, and the second was J. Palmer of Sunnyside Team No. 1. The first prize winners in the two-man event were E. Lloyd and H. Stubbs, of Sunnyside Team No. 1. The second prize winners of the same event were V. Autzak and R. Etzell of Winter Quarters Team No. 3.

The first prize winners of the three-man event were J. Haddow, W. Edwards and V. Bain of Utah Mine Team No. 1. The second prize winners of the same event were A. Curtis, A. Michlog and G. Zambelis of Clear Creek Team No. 3. The first prize for the full-team event was won by No. 17 of Castle Gate No. 2 Mine and the second prize for that event by Team No. 7 of Castle Gate No. 1 Mine.

The following problems were given:

1. One-man event—A man is found in bad air, lying on his back, overcome after a gas explosion, with a severe laceration in palm of right hand, bleeding in jets. Rescue by shouldering, and carry 20 ft. to place of safety, treating.

2. Two-man event—A man is found with face and ears badly burnt, a dislocated shoulder and a sprained ankle. Treat and carry 20 ft.

3. Three-man event—A man is found under a fall of rock with a fractured jaw; also with a compound fracture of left leg 8 in. below the knee, with bone protruding on inside of leg—severe arterial bleeding. Treat.

4. Full-team event—A man is struck by a trip in the mine and found lying in the entry on his back, with back broken and simple fracture of both bones of right arm between wrist and elbow. Treat and carry on stretcher 50 ft.

The above problems were chosen by all the judges the night before the contest, and were written and placed in sealed envelopes, there being more than a sufficient number of copies to supply one to the captain of each team. The work of the teams during the contest was governed by the following rules:

SPECIAL RULES FOR CONTEST

1. A team is composed of 6 men, and the patient will be chosen from this number.

2. The teams will be numbered consecutively, beginning at No. 1, and as the captains obtain their number they will occupy their respective positions on the field.

3. The time allowed for each event will be as follows: For one-man event, 8 min.; for two-man event, 10 min.; for three-man event, 12 min.; for full-team event, 15 min.

4. All work of the first-aid teams will be carried on under the rules of the American Red Cross.

5. The judge will prepare his problems and deliver same in a sealed envelope to each captain. The captains will hold same in hand until signal is given by the judge and they will then open the envelopes and read the problems and instruct their teams. Two minutes will be allowed the captain for doing this before signal is given for work to begin.

6. In team events, the captain will control his team by giving audible commands. Such commands, however, must be given **before work is started** and no further instructions will be given while the members are performing their work.

7. At the conclusion of any event the captain will raise his hand and announce his team number. The team will remain at its post until relieved by the judges.

8. Each team will furnish its own material, which will consist of blankets, splints and other suitable articles. The triangular bandages will be the standard, although roller bandages may be used and will receive equal credit.

9. Splints, when needed, must be prepared on the field for each event. Specially designed splints may be used, but they must be assembled during the time of each event requiring their use; except that spinal splints may be prepared prior to the event.

10. In all events requiring resuscitation, rescue of the patient, and stretcher drill, the judges may require the teams to perform separately.

11. The recorders will announce the scores to the judges, and in case of a tie, the teams with the same scores will be compelled to participate in another full-team event. Those receiving the highest scores in this event will be accorded first, second and third places, respectively.

12. The chief, or first prize, consisting of a handsome silver cup, will become the temporary property, for one year, of the camp whose team will make the highest record at this contest, for full-team event, and will become the permanent property of the camp whose team may win highest honors three times.

13. In the event that any boy teams are present, they will be accorded time for an exhibition drill and contest after the regular contest is finished. Boy teams shall be composed of boys under the age of 17. A suitable reward will be given to the boys' team making the highest scores .

WOMEN'S TEAM FROM WINTER QUARTERS, UTAH

BOYS' TEAM FROM CLEAR CREEK, UTAH

14. Each judge will mark the team number, event, and discounts for each team judged, sign his name, and deliver his report to the recorder immediately after each contest.

15. No coaching or prompting from spectators or any member of the team will be permitted, and no practicing will be allowed on the field prior to the contest.

16. The contest will begin promptly at 9:30 a.m. on the baseball field.

17. The judges' scoring rules will be as follows: Each team will be given 100 per cent. to start with, and the following penalties deducted for the offenses noted:

TABLE OF PENALTIES

	Per Cent.
For failure to be aseptic	5
For not doing most important thing first	5
For inaccurate application of tourniquet	5
For lack of, or wrong artificial respiration	5
For failure to stop hemorrhage	5
For failure to treat shock	5
For assistance given by the patient	3
For captain's failure to command properly	2
For slowness in work	2
For failure to cover wound completely	2
For loose splint	2
For not padding splints properly	2
For loose bandage	2
For bandage too tight	2
For using "granny" knots	2
For awkward handling of patient on stretcher	2
For lack of neatness	2

18. The annual contest to be held at the various camps of this company will be decided by fair and impartial judges, and no official of the company will be permitted to take part in such contest or act as judges. Neither will any local physician or expert instructor be allowed to be a member of any team or act in capacity of judge. However, mine

FROM LEFT TO RIGHT: CHIEF SCORER SNOW, CHIEF SURGEON F. S. BASCOM AND J. C. ROBERTS

foreman and assistants, and local engineers and assistants, may be members of any team in their district.

On assembling on the field the judges drew lots to ascertain which teams they were to judge first. There being 18 teams and 6 judges, each judge had 3 teams to inspect. The numbers of the three teams allotted to each judge were consecutive so that the judge would not be obliged to run all over the field. Team captains drew numbers corresponding with the position they would take on the field.

There was one scorer for each judge. Each scorer was furnished with a "list of penalties and deductions for same," "scorer's record," pencil and writing tablet. The judges were furnished with "judges score book" and 'list of penalties and deductions for same."

The chief scorer made records of the teams occupying each numbered position, the mine or town they came from, the captains' and men's names, the home numbers of the teams, and also the numbers of the particular teams assigned to each judge, the judges' names and the event to be performed.

As the judges inspected the work they made notes in "Judges' Score Book" of the deductions of each team, and delivered same to the scorers who added up the deductions, calculated the net points for each team, wrote the names of the contestants on the scorer's record, signed their names, sealed the reports in the envelopes marked for the event, and delivered them to the chief scorer.

CONTESTANTS

Team No. 1
Team No. 2
Team No. 3

(Signed) .....
Scorer.

After judging three teams for one event the judges passed on to the next three teams (next higher numbers) in line, taking the scorers with them. For each event the same procedure was followed so that no judge could examine the same team twice.

FIRST-PRIZE WINNERS, ALL EVENTS, CASTLE GATE NO. 2 MINE

WINNERS OF SECOND PRIZE, ALL EVENTS, CASTLE GATE NO. 1 MINE

One set of blanks was given for each event.

For the one-man event, $\frac{1}{5}$, for the two-man event, $\frac{2}{5}$, and for the three-man event $\frac{3}{5}$ of the total was taken as the result. For the full-team event 100 minus the deductions was taken as the score. Thus the highest possible figure attainable was 220.

As the events were decided the sealed envelopes were handed to Chief Surgeon F. S. Bascom, State Coal Mine Inspector J. E. Pettit, and Chief Engineer A. C. Watts. The chief surgeon opened the envelopes, called off the score to the chief engineer who recorded them, and then handed them to Mr. Pettit, who verified them. Thus in a few minutes after the last events the results were known. These, however, were not given out until ties for first and second places in the first three events were announced and worked off, and then not until after dinner, which was served in the various halls of the town, and until after the judges had all met and gone over the results.

The problems given for deciding the ties were decided upon by the presiding judges just before work was started and read to the teams upon commencement of the work . They were as follows:

One-Man Event

For second place—Man is found under a fall of rock with both feet badly crushed and bones broken. Treat and carry 20 ft.

Two-Man Event

For first place—Man is found with compound fracture of right forearm 6 in. above wrist, severe bleeding and body burned over chest and stomach. Treat.

Three-Man Event

For second place—Man is found with dislocated left shoulder and a compound fracture of right thigh (intermediate) with severe bleeding. Treat.

The closeness of the contest is shown by the fact that eight teams tied for places in the different events. The total scores varied between $189\frac{1}{5}$ and $216\frac{2}{5}$.

FUTURE MODIFICATIONS

As this was the first attempt by the company to have a full contest there were, of course, some particulars which may not have been provided for as adequately as they might have been. General Superintendent Williams and other officials are now gathering suggestions as to the manner of handling future events with the idea that little slips made this time can be corrected next. For instance one of the superintendents has suggested that the field of contest be arranged in the form of a V with the wide end facing and close to the grand stand so that relatives and other interested spectators may have a better view of the whole proceedings. The announcements will be made through megaphones. The rules governing the contests will be revised with the assistance of outside experts so that a thoroughly standard set of rules may be formulated, and penalties enlarged. Also future contests may have mine conditions represented so as to create a more realistic scene of operation.

After dinner a closely contested and exciting baseball game between the Somerset and Castle Gate mines was played resulting in a victory for the latter team by a score of 5 to 4 During the game the results of the first-aid contests were announced and prizes awarded by General Superintendent Williams, who acted as chairman for the entire occasion.

Following the baseball game the football teams of Castle Gate and Clear Creek gave a fine exhibition of the favorite British pastime, resulting in a victory for the Castle Gate team by a score of 2 to 0.

The balance of the day until time for the excursion trains to leave was spent in general merrymaking. With fine weather the day was passed very pleasantly, and it is hoped will mark the beginning of a like series which will be looked forward to with eager anticipation.

This article would not be complete or do justiee to all if it did not acknowledge the good spirit which has actuated the employees of the company at the various mines. The officials take general pleasure in acknowledging that it was due to a very great extent to the energy, enthusiasm and faithful work of the men of the mines, many of whom made sacrifices in order to help the work, that the first-aid movement has started so auspiciously. In a large measure, the future of the movement will be due to the continuance of the zeal exhibited in the preparation and execution of the first meet.

The Education of Foreign Miners

SPECIAL CORRESPONDENCE

SYNOPSIS—The writer directs attention to the increasing number of foreign miners in Illinois and gives an account of a conference in that state. He details Peter Roberts' system of instruction by which the men are taught verbs first. Ear training precedes that of the eye. Men who do not know foreign languages can teach English to a class consisting of men of all nations.

An increasing number of non-English speaking men are entering the mines in Illinois. Formerly the coal miners spoke English, and were either American by birth or had come to the United States directly from England, Scotland, Ireland, Wales or Germany, where they and their forefathers had been engaged in mining. At present the bulk of the mining is being done by men from southeastern Europe; Slavs, Huns, Poles, Italians, Greeks and Lithuanians. These men when in Europe were mainly agriculturists, and although many of them had no knowledge of mining prior to coming to America, they are frequently put into the mines soon after landing, without preliminary training, and too often before they can speak or understand the English language.

For these men, the Illinois Miners' and Mechanics' Institutes have a special mission, to instruct them in the general principles of mining and in the rules and regulations for safety, and at the same time to increase their knowledge of colloquial English. In order to bring this important subject to the attention of miners, operators, teachers and others whose interest is centered in communities where a large portion of the population is made up of foreigners, the institutes offered, under the auspices of the Summer Session of the University of Illinois, a conference and short course on the education of people speaking foreign languages. This occurred at Urbana, Ill., from July 14 to 17, inclusive.

PROGRAM OF THE CONFERENCE

July 14. 10 to 12 a.m. Conference, R. Y. Williams, director of the Illinois Miners' and Mechanics' Institutes, in charge. "Helping Communities of Foreign-Speaking People." Prof. R. E. Hieronymus, community advisor, University of Illinois; Peter Roberts, secretary, international committee, Y. M. C. A.; John H. Ross, superintendent, Superior Coal Co.; C. H. Johnson, professor of education, University of Illinois; F. E. Held, assistant in German, University of Illinois.

July 14. 1:30 to 4 p.m. Conference. "Teaching English to Foreign-Speaking Men." Demonstration. Peter Roberts.

July 15. 8 to 9 a.m. "Requirements in Teachers Training Foreigners." Peter Roberts.

July 15. 7:30 to 9:30 p.m. Stereopticon lecture on "The Foreigner and His Need," with discussion during the last hour on "How Best to Meet These Needs." Peter Roberts.

July 16. 8 to 9 a.m. "Ethnic Factors in Immigrants to North America." Peter Roberts.

July 16. 4 to 5 p.m. "How to Start Work for Foreigners." Peter Roberts.

July 17. 8 to 9 a.m. "The Foreigner as an Asset to Industrial Communities." Peter Roberts.

CHANGE IN CHARACTER OF MINING COMMUNITIES

According to the census of 1890, less than 10% of

the mining population in Illinois were immigrants from southeastern Europe. During the decade 1890 to 1900 there was a change in the racial composition of the mine workers in Illinois due to the development of two additional sources of labor supply: (1) An influx of mine workers from other coal fields of the United States, (2) the arrival of immigrants from Southern and Eastern Europe. The migration from other fields in this country was made up principally of the English, Scotch, Irish, Welsh and Germans, who left the mines of Pennsylvania and other eastern mining states because of labor disputes and the pressure of races of more recent immigration who were entering the industry in those states. The European races which at the time were securing employment in the Middle West were north and south Italians, Lithuanians, Poles, Russians, French and Franco-Belgians, and a few Magyars.

More than One-Half Were Born Abroad

After the year 1900, the movement of immigrant races of Southern and Eastern Europe into the Middle West steadily continued, and was especially marked during the period 1902 to 1907, on account of the extraordinary development and the opening of new mining districts. During this period a movement of the races of older immigration out of the mines of the Middle West to other mining localities, especially those of Kansas and Oklahoma, under the pressure of the recent arrivals, was also noticeable. In 1910, it was estimated that slightly more than one-half of the total number of employees in the coal mines of Ohio, Indiana and Illinois were of foreign birth, and that almost three-fourths of the foreign-born belonged to races of Southern and Eastern Europe.

The situation at the present, therefore, as regards the racial classification of mining employees, is in strong contrast to that prior to 1900, and it is evident that since that year there has been a constant and increasing influx of races from Southern and Eastern Europe into the mines of Illinois.

An element of danger to those working in the mines is the fact that many of the recent immigrants do not speak English with any degree of fluency or understand it when rapidly spoken, and almost none are able to read or write the language. Because of these facts it is probable that the instructions of those in authority are frequently misunderstood. A mine foreman, for instance, tells an immigrant miner, in English of course, that his roof needs propping. The miner seems to understand, but does not, and in consequence a fall of top may result in injury to the miner. Printed signs used to indicate the presence of gas or other peril, are unintelligible to many of the foreigners.

Roberts' Method of Teaching English

A successful method for teaching English to foreigners has been developed by Peter Roberts, of the International Committee of the Young Men's Christian Association. The main feature of this method is to tell a story in a series of short, pointed sentences arranged in logical sequence so that the general flow of thought will not be broken. In this scheme the verb has been given great prominence, as it is the most difficult element of the language. The sentence is considered as the unit of language, contrary to the usual teaching that the word is the unit.

It is considered that the ear is the organ of language, and therefore the method is applied without the use of text-books, the pupils beginning to talk simple English sentences at once.

A sample lesson is given below—the first lesson in the general course:

Awake	I awake from sleep
Open	I open my eyes
Look	I look for my watch
Find	I find my watch
See	I see what time it is
Is	It is six o'clock
Must get up	I must get up
Throw back	I throw back the bed-clothes
Get out	I get out of bed
Put on	I put on my pants
Put on	I put on my stockings and shoes
Wash	I wash my self
Comb	I comb my hair
Put on	I put on my collar and necktie
Put on	I put on my vest and coat
Open	I open the door of my bedroom
Go down	I go downstairs

The Meaning of the Sentence Is Illustrated by Dumb Show

The instructor first divides the lesson into three sections, as indicated above. He then repeats to the class the verbs in each sentence of the first section, conveying to the men the idea that they are to repeat the words after him. When the class has become familiar with the verbs, the instructor repeats the first sentence, "I awake from sleep," using appropriate gestures to convey the meaning of the sentence to the class.

Several repetitions are sometimes necessary before the men grasp the idea, but finally the men can repeat the sentence themselves, while the teacher simply acts it. The second sentence is then taken up in the same manner; "I open my eyes," and when the men have learned to repeat this without assistance from the instructor, the succeeding sentences are taken up in order, the entire number which have been studied being repeated in order as soon as each one is learned.

The Lesson Chart Is Shown after Words Are Learned

It is found that about half an hour is required for the men to be able to repeat the entire lesson without the aid of the instructor. After this, a large chart containing the printed lesson is placed on the wall, and the instructor reads the first sentence, pointing to each word as he pronounces it. Soon the class understands that the printed characters represent just what they have been learning to say, and they repeat each sentence as the instructor points to it. After the entire lesson has been read over a few times, the instructor begins to skip around the chart, and the men read the sentences as he points to them.

Following the reading lesson, small lesson sheets containing both the printed and the written sentences of the lesson are handed to the men, and they are told that they are to copy the writing. It is found that the men who are able to write in their own language are the first to learn to write the lesson, even though the characters of the alphabet with which they are familiar are entirely different from those they are now learning.

Then the chart is covered up, and the teacher asks "What is the first sentence"? The men clearly do not understand, but when the teacher repeats the question, and then acts the sentence, they grasp the idea quickly enough, and soon the entire lesson is repeated, the in-

structor uncovering each sentence after the men have repeated it correctly.

Following a demonstration by Dr. Roberts with a class of Italians, only one of whom could speak any English, the method was discussed and heartily endorsed by the educators present at the conference.

Illinois Will Follow These Methods

Individual instruction in the method was given to the instructors in the Illinois Miners' and Mechanics' Institutes, in order that when they take up their field work in the fall, they may be able to assist the communities in which they are stationed, in educating the members of the community who cannot speak English. While the classes in mining will prevent these instructors from giving their attention to the work of teaching English to foreigners, yet they will be in a position to assist and advise those who do this work, thus fulfilling one of the objects of the Institutes, "to promote the technical efficiency of all persons working in and about the mines."

It is planned by R. Y. Williams, the director of the institutes, to publish a bulletin containing copies of the lectures given at the conference, with the discussions which followed them. A copy will be sent, on publication, to all persons interested in the work. Requests for the bulletin should be made to the Director of the Illinois Miners' and Mechanics' Institutes, Urbana, Ill.

The Woodward-Pettebone Meet

The Woodward-Pettebone Meet is a meet with the Woodward-Pettebone teams left out and this peculiarity is worthy of explanation. Last year the Woodward and Pettebone first-aid men decided to raise money for the construction of a hall by holding a first-aid meet, and they thought well to keep out of the contest so that there could be no suggestion of unfairness in the management of the field.

Their efforts have been entirely successful. Though most of the competing teams were from Delaware, Lackawanna & Western Coal Department collieries, there were some also from the Raub and the Temple coal companies. It is gratifying to know that despite the liberal prizes offered, the Woodward and Pettebone first-aid men are making these meets most profitable ventures.

On Aug. 15, no less than 21 cars, forming three trains ran over the Lehigh Valley R.R. to the meeting place, Harveys Lake, and carried between 3500 and 4000 people. A great improvement in technique over that exhibited last year was noted by the judges. The events for the men were as follows:

(1) Simple fracture of both collar-bones; punctured wound over left eye, and laceration of right ear. (2) A compound and simple fracture of the upper third of the left thigh and a punctured wound of the left side of the abdomen, about 6 in. above the upper fracture; bleeding from both wounds; also a fracture of the right elbow joint. (3) After an explosion of gas, a man is found unconscious and burned about face, neck, ears, chest and hands.

The boys' teams, of which there were two, did their work at the same time as the teams of men. Apparently, one of these teams was misled by seeing the men dressing a left leg as required and they also dressed that leg, though their own problem called for the right. One team represented the Bethesda church and only one of the teams came from a mine. This team represented the Truesdale Colliery. The boys' events were:

(1) Simple fracture of left collar-bone and laceration of scalp, also laceration of the palm of the right hand. (2) Compound fracture of right leg with bleeding, and two first fingers on left hand crushed.

Following these was a one-man event open to the captains of the teams or to any individuals they might name. This event was the making of a roller-bandage dressing of the left arm and chest.

To avoid ties, it was arranged that the most rapid execution should decide any equalities in rating, the most rapid of two teams whose work was otherwise of equal merit getting the higher award.

Auchincloss Colliery of the D., L. & W., took the first prize of $50, and each member of the team received a Baldwin acetylene lamp. The second prize of $25 went to the Harry E. colliery team of the Temple Coal Co. Two D., L. & W. teams took third place on dead reckoning, Truesdale No. 1 Slope and Truesdale No. 6 Slope, but the first being the more rapid, took third prize of $15 and the second, the fourth prize of $10. A Koehler safety lamp was awarded to the captain of each of the four winning teams.

The Bethesda Church team took the first prize for boys, which was $15. The Truesdale boys received $10. The captains' contest was won by Isidor Hochreiter, of Harry E. col-

The Prize Winners of Auchincloss Colliery of the Delaware, Lackawanna and Western Coal Department

H. G. Davis, General Superintendent, and H. H. Hitchins, Mine Foreman, at D. L. & W. Co.'s Auchincloss Colliery

liery; John Cummings, of the Shawneeites, made an equal rating, but was placed second, owing to his being slower than his opponent. Both received Koehler aluminum safety lamps as prizes.

The standing of the teams was as follows: Auchincloss, 98⅔; Harry E, 98; Truesdale No. 1 Slope, 97⅓; Truesdale No. 6 Slope 97⅓; Pyne 96⅔; Bliss, 96⅓; Shawneeites, 96⅓, Truesdale Tunnel, 96⅓; Storrs, 96; Raub, 95⅓; Avondale, 95; Central 94⅓; Temple Coal Co., 94.

The Bethesda boys' team received 97 points and the Truesdale, 96½. The captains' contest had the following result: Harry E. and Shawneeites, 99. Pyne and Avondale, 98; all others, 97.

The Terre-Haute Meet

The United States Bureau of Mines and the American Mine Safety Association will conduct a national first-aid and mine-rescue meet at Terre Haute, Ind., Sept. 12. The program is under the auspices of the Indiana Bituminous Coal Operators' Association with the coöperation of the United Mine Workers of America, District 11, and the American Red Cross. This is the first meet of its kind ever held west of Pittsburgh and is attracting the interest of the miners and operators of the Central West.

Contests of first-aid and mine-rescue teams and individuals will be held during the morning and afternoon. Individuals trained in the work will have an opportunity to compete in the morning and in the afternoon the teams will compete. All work will be judged by representatives of the American Red Cross, and will consist of treating scalp wounds, broken limbs, lacerations and other work requiring first aid.

Prizes will be awarded winners in the contests and as there will be several prizes, a large number of contestants is expected. The large Bureau of Mines explosion chamber will be brought to Terre Haute and erected for the day and in it mine-rescue work will be demonstrated. During the evening a smoker will be held for all taking part in the meet. Short addresses will be made by J. A. Holmes, director of the Bureau of Mines; J. P. Reese, president of the American Mine Safety Association; Governor Ralston and others.

Many teams have entered the meet through Dr. August F. Knoefel, of Terre Haute, vice-president of the Mine Safety Association. G. F. Powell, superinendent of Car No. 3, of the Bureau of Mines, has trained several teams in mine rescue during his trips through the state and several of these teams are expected to enter. Mr. Powell will be here on the day of the meet with his special car.

British Views on Oil from Coal

Special Correspondence

Considerable interest has been aroused in London regarding the reported plan of the government for acquiring a coal field from which to produce fuel oil for the use of the navy. One of the leading English experts on oil extraction from coal, when interviewed, disclaims any knowledge of such a government plan, but would not dismiss the project as impossible.

While doubtful of any large production of oil from coal on a commercial basis, he pointed out that as a war measure it might be practicable to obtain this fuel for the navy from some Lancashire, North Wales and Scottish coals. He explained that the only coal which can be expected to yield fuel oil on a commercial basis at present, is cannel coal, such as comes from the Irish cannel deposits at Ballycastle, near the Giant's Causeway, to exploit which a company was recently organized.

Apart from this use, cannel coal is at present a drug on the market, and there is no prospect of the deposit mentioned yielding anything like 400,000 tons of fuel oil per year. It might, however, be expected to yield possibly 20,000 tons annually.

If the government could secure a field of coal exceptionally suitable for the production of oil, the quality verging on cannel, it might be worth while acquiring as a war measure. It is doubtful, however, if such a field could be found sufficiently large to yield the quantity required for any considerable number of years. It is improbable that there are extensive fields of absolutely suitable coal in Britain.

A Coal-Field Acquisition Would Be a War Measure

It is not necessary, however, to consider the problem of fuel oil for the navy on a purely commercial basis. It would be a war provision and from that point of view many coal fields might become practicable. Welsh steam coal would be of no value, and ordinary house coal would not be of much use except as a last resort. For instance, ordinary Durham and Midland house coal would be at present out of the question unless a demand for certain byproducts, which does not now exist, could be created.

In Lancashire, on the other hand, there are coals which give a high yield of oil, although they might not be quite commercially practicable at present prices. This region has large deposits verging upon cannel. There are also some suitable measures in North Wales and some in Scotland.

The kind of fuel required for the navy is the heavy mineral oil that is often called "Diesel" oil. It is heavier than kerosene and until recent years has not been in demand. It is of a high flash point, the Admiralty specification requiring a flash point of over 200 deg. Fahrenheit.

To produce 400,000 tons yearly of such fuel, would require 5,500,000 tons of coal annually. The figures of extraction from such coal as may be found in Lancashire are about as follows: Maximum yield of crude oil per ton of coal, 30 gal.; oil suitable for navy fuel per ton of coal, about 15 gal.; 400,000 tons of oil equals 84,000,000 gal., and at 15 gal. per ton, this means 5,600,000 tons of coal.

The total amount of coal at present produced in the kingdom is about 250,400,000 tons. As has been stated, the most suitable deposits are found in Lancashire, Cheshire, North Wales and Scotland. The total production from these sections is as follows: Lancashire and Cheshire, 23,063,198 tons; Scotland, 39,500,000 tons; North Wales, 3,259,000 tons. This gives a total production of 66,000,000 tons of coal per year, from which the Admiralty's 5,500,000 might be found.

It may be taken for granted that the Admiralty is closely watching the development of all processes for the extraction of fuel oil from coal.

When quick burning briquets are wanted remember that large briquets are harder to light than small ones; the same is also true of briquets made of fine slack, or of very dense briquets. It is also worth noting that inorganic binders tend to make the briquet slow to fire. Increase of inorganic matter in the slack also gives the same result.

Discussion By Readers

The Ohio Situation

In reading the article entitled "The Labor Situation," COAL AGE, Aug. 8, p. 232, my attention was arrested by the following statement made in relation to the Ohio situation:

> The agreements in other sections being based on the promise that no concession would be made to eastern Ohio operators, the Union, it would appear, should make an equal concession to the other Ohio mine owners, should it permit the eastern Ohio operators to make a more favorable scale, etc.

If I understand the situation and am correctly informed, there was, in the beginning, a more or less distinct understanding on the part of the coal operators, to which the mine officials gave tacit consent, that the run-of-mine law was not to interfere with last year's scale of prices. The present situation would seem to indicate that this tacit agreement has either been lost sight of or is being purposely ignored by the mine officials.

According to the reported statement of Pres. W. R. Woodford, of the Pittsburgh Vein Operators' Association, of Ohio, published in the Wheeling *Intelligencer*, Aug. 7, the miners, in his opinion, were showing too much obstinacy at the present time, and had manifested the same disposition from the beginning of the strike, Apr. 1. It was this feature that made it impossible to reach an agreement with the operators at the recent Wheeling conference. Pres. Woodford is quoted as saying further:

> We have stated to the men and reiterated time and again that the operators of Ohio stand ready to meet the men, at any time, in a conference where a scale that will be the equivalent of last year's contract will be considered. I want to say that the miners of Ohio have earned more under the two years' contract that expired Mar. 31, 1914, than they ever did before in the history of the industry.

I understand that the miners' officials have averaged the percentage of slack made at the mines in the Hocking Valley, Cambridge, and eastern Ohio districts, as 28, 34 and 36 per cent., respectively, making an average in these three districts of $32\frac{2}{3}$ per cent. The last year's screened-coal rate was 69.5c. per ton of screened coal, which was $100 - 32\frac{2}{3} = 67\frac{1}{3}$ per cent. of the total output. To equalize this scale, on the run-of-mine basis, the mine officials figure that the payment should be $0.67\frac{1}{3} \times 69.5 = 47$c. per ton.

However, the injustice of this lies in the fact that the Hocking Valley miners have been reduced 2½c. per ton, while an advance of 2½c. per ton has been placed to the credit of the eastern Ohio miners, which allowances, as far as the operators are concerned, certainly give the Hocking Valley operators an advantage of 5c. per ton over last year's prices.

In closing, permit me to say that if the miners' officials have only been guessing at these figures and are not quite certain as to what the run-of-mine prices in the different districts should be, it would seem proper that they should appoint a scale committee to meet a committee of the operators in an endeavor to arrive at some fair settlement of the matter, instead of adjourning their meeting as hurriedly as was done at the recent Wheeling conference.

COAL OPERATOR.

Eastern Ohio.

An Important Feature of the Coal Industry

I read with deep interest the article by Eli T. Conner, published some time since, COAL AGE, Vol. 5, p. 912. Mr. Conner deserves much credit for the able way in which he has discussed a feature of growing importance in the coal industry. He is thus encouraging the public to think along lines in which they are vitally concerned, and in regard to which his years of experience in the producing end of the coal business enable him to speak with authority.

Mining men acquainted with conditions in the anthracite field of Pennsylvania are reluctantly compelled to admit that the methods of mining coal in that region have not been as carefully guarded, from an economical standpoint of extraction, as should have been the case. While, in a few instances, the percentage recovery of coal per acre has been quite satisfactory, in the large majority of cases wasteful methods have been employed, and considerable areas of coal have been abandoned for deposits that would better meet the requirements of the market and bring quicker returns on the capital invested. Viewed from the standpoint of the conservation of natural resources, the results are, admittedly, a disgrace to scientific mine management.

The burden resulting from these unhappy conditions falls not on the operators, but on the miners and the consuming public. They are the ones who must eventually pay, and are today paying for the economic errors of the industry. Such errors on the part of the management increase the cost of production; and the difference, instead of being deducted from the dividends or proceeds of the business, are either met by a curtailment of operating expense, or reduction in the price paid for mining, or they are added to the selling price of the coal. It is to be regretted that, in the operation of large industries, the question of maintaining dividends receives greater consideration than that of paying living wages to the miner and selling the output at living prices to the consumer.

The statement made by the late George F. Baer, and referred to by Mr. Conner, draws attention to a natural law laid down by Anderson, Malthus, Ricardo, Smith and other writers on political economy, which is to the effect that:

> The price of the entire supply of anything necessary for a community will be regulated by the cost of production of that portion of the necessary supply which is produced at the greatest expense.

This law is true today, because of the strong competition in the sales departments of the several coal companies operating in the anthracite field.

It must be remembered that the laws of economics are quite as fundamental and inexorable as the laws of science. Sir Isaac Newton would have freely admitted that the apple would not fall to ground if he had the power and the inclination to bind it fast to the tree. In like manner, any political economist, from Malthus down to the latter-day Mills, would be compelled to admit that *the price of the entire supply of anything necessary for a community is regulated by those that have the power and inclination to fix the price.* Suppose for a moment the selling price of anthracite coal, the wages paid the miner and the dividends declared were in the hands and controlled by a quasi judicial board, it is fair to assume that, with careful management in the operating end of the industry, a more equitable distribution of the returns would be possible; and capital, mine workers and the consuming public would be better served.

We may ask what does Mr. Conner mean to imply by quoting this statement in this connection. The logical conclusion to be drawn is that the price of anthracite will continue to rise, owing to these conditions, until controlled by some adjudicating power. Mr. Conner's suggestion is that the industry as a whole should be directed by a board of trustees or commissioners; and he says he makes this suggestion with a view to provoking discussion of the subject. In addition to the duties outlined by Mr. Conner for the guidance of such a commission, may I be permitted to suggest that they should prescribe the manner and the amount of taxes to be paid on all coal mined.

I would like to ask Mr. Conner if there is any reason why the commission he suggested should not be appointed, and whether or not the action recently taken by the government has in any sense divorced the railroad companies from their coal-mining interests? Surely, if the police powers of the state and nation can be invoked to regulate labor, the same powers should be available to regulate the transactions of capital. It would seem that this, and this alone, can effectually regulate and control the conflicting interests in the several mining districts of the country, so as to conserve the coal, and harmonize general labor and market conditions to the best advantage. Who can suggest a method by which these results can be effectively attained?

PROGRESSIVE.

Bluefield, W. Va.

Conservation of Surface Values in the Extraction of Coal

Referring to the letter on this subject, COAL AGE, Aug. 15, p. 277, I want to endorse what Mr. Parfitt has said in regard to the growing need of the adoption of means and methods, in the mining of coal, that will afford more general support to the overlying surface, much of which has a more far-reaching value than the mineral lying below.

Both coal and surface are valuable assets of present-day civilization and each must be so regarded. The principle of conservation does not apply to one of these assets more strongly than to the other. There can be no economy in sacrificing the value of surface holdings, in order to realize a temporary income from the mineral that underlies the same. The mining engineers of large coal companies must devise and put into execution more stable methods of mining coal.

A MINING ENGINEER.

Scranton, Penn.

The Coal Miner

I was glad to note the references made by Mr. Hanger, COAL AGE, Aug. 15, p. 278, to the proper treatment of miners by their foreman with a view to maintaining discipline in the mine. While Mr. Hanger emphasizes the need of certain punishment for any violation of the mining law or mine regulations on the part of the men, he states plainly that "In no case should a personal indignity be inflicted" by the use of epithets that only give rise to resentment.

In view of the many hardships and dangers that are the daily experiences of miners, a foreman should exercise the greatest thoughtfulness and kindness in dealing with their eccentricities. The public owe much to these men, many of whom have devoted their lives to the mining of one of the greatest necessities of civilization. Perhaps the majority of miners can look forward to *one* of two forms of death—being killed in the mine, or succumbing finally to that dread disease, miner's asthma.

It is these considerations that should command for the miner the highest regard in respect to his surroundings and necessities. The fact should not be forgotten or overlooked that his family and home are just as dear to him as to other men. He is as anxious to do well by those who look to him for support as is the foreman or superintendent, or others holding better and more lucrative positions. Enforced idleness, due to an accident in the mine or other cause, or such drawbacks and hindrances as the thinning out of the coal or a heavy fall of roof in his chamber greatly impair the miner's income, and call for due consideration on the part of the foreman in dealing with such conditions. The thoughtful word and kind treatment of a foreman go far to alleviate the troubles that fall to the lot of the miner.

There have been instances where the complaint of the miner that the roof in his chamber is "bad," has brought the harsh and thoughtless reply from the foreman, "You are no better to be killed than any other man." The request by a miner for a "better place," that he may increase his earnings to meet special expenses for which he is in no way responsible and therefore could not avoid, has, in many cases, called forth a curt and profane reply.

Such treatment of a miner by his foreman can only arouse ill feeling and enmity in the mind of the man who is compelled to work under difficult conditions. The ill feeling is due more to the fact that the miner realizes that his foreman has no sympathy for him in the matter, but regards him simply as a human machine. As a result, the foreman is often charged with favoritism. It is needless to say that such treatment on the part of the foreman produces very poor returns when there is urgent demand for coal, and it is necessary that every man do his best to increase the daily output of coal. The treatment the miner receives from his foreman does not encourage him to give other than the same in return. As a result, there is great lack of coöperation in the mine, and discipline is at a low ebb.

THOMAS R. PIERCE.

Scranton, Penn.

Permissible Electric Mine Lamps

Referring to the inquiry relating to schedule No. 6, recently sent out by the Federal Bureau of Mines, making certain suggestions in reference to the details of construction of electric mine lamps, COAL AGE, Aug. 15, p. 280, we believe it would only have been fair to the Bureau of Mines, as well as to others interested in the subject, had the name of the correspondent been attached to the inquiry. The reason for this is, to us, most obvious.

As indicated in the editorial comment following this inquiry, these suggestions may have been necessitated by the requirements, in the proper testing of the lamps submitted to the Bureau. The subject of electric safety lamps is a new one in this country, and we consider that extensive experiments will be required before standard methods can be adopted for testing, and standard instructions issued in regard to the use of such lamps.

We consider that the Bureau of Mines has been fair throughout, particularly so as regards the manufacturers who have submitted their products for tests to the Bureau. In every case, the engineers of the Bureau have spared no pains to give all the assistance in their power, to render the tests satisfactory and efficient. For these reasons, we consider correspondent's inquiry as unfair to the Bureau of Mines, as well as to other interested parties, and think that his name should not have been withheld, but should have appeared with the publication.

X.

——, Penn.

[As is well known, the Discussion department of COAL AGE is open to the frank and honest criticisms of all readers of the paper, and the discussion of any points and methods that are of practical interest. The purpose is to draw attention to matters, in regard to which an interchange of views and opinions will be helpful and of advantage. It is particularly desirable that personality shall be eliminated, and the writer of the contribution has the right to request that his name be withheld from publication, which request is invariably respected.

In the present case it is quite obvious that all manufacturers of electric mine lamps should appear incognito, in the discussion of a question that is of common interest to all, and which it is the province of the Bureau of Mines, as adjudicator, to decide. The publication of a name to such a contribution would appear, in some cases, as a bid for favor, while, in other cases, the criticism would unjustly prejudice the Bureau and render an impartial consideration, on their part, difficult.—ED.]

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

The following tables give the average specific gravities of most solids and liquids of importance in coal mining. The important mine gases are tabulated elsewhere.

Comparison of Standards—Hydrogen, air and water are the three standards commonly used in the determination of the specific gravity of gases, liquids and solids. The relative densities of these standards are as follows:

Air (dry) is 14.418 times as heavy as hydrogen, at the same temperature and pressure, volume for volume.

Water (max. density, 4° C.) is 773 times as heavy as dry air at 32 deg. F., bar. 29.92 in.; and 815 times as heavy as dry air at 60 deg. F., bar. 30 in., volume for volume.

SPECIFIC GRAVITIES AND UNIT WEIGHTS OF SOLIDS AND LIQUIDS

Substance	Average sp. gravity (Water = 1)	Average weight (Lb. per cu.ft.)

Inquiries of General Interest

Method of Working Underlying Coal Seam

I am interested in the problem of working a seam of coal 4½ ft. in thickness and lying from 35 to 40 ft. below another seam 9 ft. in thickness, which has been worked out and abandoned. I submit the accompanying vertical section showing approximately the geological features of the strata.

A Vertical Geological Section

As here shown, the seam of coal it is proposed to work is 4 ft. 6 in. thick, and underlaid with about 2 ft. of fire clay, beneath which is from 5 to 6 ft. of sandstone, again underlaid with the usual shale formation. Above this coal and between it and the 9-ft. seam that has been worked out and abandoned, the strata consist of from 35 to 40 ft. of soft shale and slate, interstratified with an occasional ledge of limestone, varying from 1 to 3 ft. in thickness. Above the 9-ft. seam there are from 100 to 140 ft. of soft shale, slate and clay, with occasional ledges of limerock.

The 9-ft. seam of coal was worked on the advancing room-and-pillar system, with the result that a large number of surface caves took place. From the nature of the strata forming the roof of the underlying seam, the same trouble may be expected in mining that coal. Indeed, owing to the increased depth of the seam and the liability of the pillars still remaining in the upper seam breaking through into the lower workings, the trouble will probably be experienced to a greater degree than in the mining of the upper seam. In this strata, a heavy fall of roof in the mine generally causes a break that reaches to the surface, and these breaks are of frequent occurrence. The same feature, however, eliminates the danger of a squeeze or creep occurring in the mine, which is a thing practically unknown.

It has seemed to me that the most practicable method of working this lower seam is to drive the entries to the boundary, and then work out the coal on the room-and-pillar retreating system, drawing all pillars as quickly as the rooms are finished. It is understood, of course, that ample provision must be made for drainage in every portion of the workings.

It should be stated that, unfortunately, no reliable survey and plan of the workings in the upper seam have been preserved or are available, and it would be impracticable to assume that the pillars in the lower seam can be kept vertically under those in the upper seam, the most of which have probably been removed. The greater portion of the mining in the upper seam was performed many years ago, when it was not considered necessary to mine the coal in any regular fashion or to survey and map the workings in an accurate manner. I believe this condition is not an uncommon one in many mining districts, and that its discussion will prove of interest to many readers who are mining coal under similar conditions. I hope, therefore, that this inquiry will bring forth many valuable suggestions.

G. E. Lyman, Mining Engineer,
Madison Coal Corporation.

Glen Carbon, Ill.

As subjects for discussion, the methods of working coal seams under varying conditions have proved most interesting. The methods and plans suggested have come from practical men who have worked out their details as the conditions in the mine required. Many of these methods are the results of long years of experience, coupled with a knowledge of mining principles that make them of great practical value. Many readers of Coal Age have profited by these suggestions, and much coal has been recovered that would otherwise have been lost for lack of a proper method or plan.

The case suggested by this correspondent represents, as he says, no uncommon occurrence in coal-mining fields. In response to his request, Coal Age will be glad to give space to a full discussion of the difficulties presented by these conditions, and the best method of overcoming them.

Problem in Algebra

Kindly solve the following, which is Problem No. 10, p. 270, of Wentworth's Higher Algebra:

"A," in running a race with "B," to a post and back, met him 10 yd. from the post. To make it a dead heat, B would have to increase his rate $47^3/_7$ yd. per min. But, if without changing his pace B had turned back on meeting A, he would have reached the starting point 4 sec. later than A. What is the distance from the starting point to the post?

Lincoln Place, Penn. Student.

Solution—Let r = B's rate (yd. per min.); $r + 47^3/_7$ = A's rate. Calling the required distance to the post, x, A travels $x + 10$, while B goes $x - 10$. These distances being proportional to the rate,

$$\frac{x + 10}{x - 10} = \frac{r + 47\frac{3}{7}}{r}$$

which reduces to

$$83x - 35r = 830 \qquad (1)$$

The 4 sec. ($^1/_{15}$ min.) B is behind A, at the finish, represents a distance $r/_{15}$ yd., to gain which required $r/_{15} \div 47^3/_7 = 7r/_{4980}$ min. In that time A has gone $x - 10$ yd; hence

$$x - 10 = \frac{7r}{4980}(r + 47\tfrac{3}{7}) \qquad (2)$$

Combining equations 1 and 2, gives finally for the required distance to the post, $x = 116^{42}/_{83}$ yd.

Examination Questions

Miscellaneous Questions

(*Answered by Request*)

Ques.—What is ascensional ventilation? State also the advantages and disadvantages of its use.

Ans.—In mining, the system known as ascensional ventilation is that in which the air enters the mine workings at the lowest point and from thence circulates to the rise, in its passage throughout the mine. In this system the downcast or intake communicates directly with the lowest part of the dip workings, while the upcast is located at the highest point of the rise workings.

The great advantage of ascensional ventilation in mining is derived from the fact that the intake air is usually cooler than the mine air. On passing into the mine, it shortly becomes heated and rises naturally to the higher levels, by virtue of its decreased density due to the increase in its temperature. Where a mine is properly arranged, there is no disadvantage in the use of ascensional ventilation, except it may be for a short time in the summer season when the outside air entering the mine has a higher temperature than that in the mine and conditions of ventilation are consequently reversed.

Ques.—Does a high velocity of the air current assist in producing an explosion, in a wet mine?

Ans.—A high velocity of the air current, by which is meant a greater velocity than what is required to properly ventilate the workings of the mine, is always favorable to the development and propagation of a mine explosion, this being true in either a dry or a wet mine. In a dry mine, a higher velocity of the air current means a larger quantity of dust carried in the air, greatly increasing the explosive conditions of the mine air. In either a wet or a dry mine, a higher velocity of the air current means a larger supply of oxygen per minute, which increases, to that extent, the possibility of the inflammation of gas or dust. In coal mining, the best ventilation is secured where the quantity of air supplied at the face of the workings is only sufficient for the complete removal of the gases generated in the mine, and where the velocity of the air current is sufficient for this purpose, but not such as to increase explosive conditions in the mine either from an excessive supply of oxygen or from the suspension of dust carried in the air current.

Ques.—Is there any danger in the installation and use of a gasoline motor in a mine?

Ans.—A gasoline motor is not an ideal motor for use in a coal mine. Under certain possible conditions, common to mining practice, the discharge from such a motor rapidly vitiates the mine air. Aside from this, the handling of a highly explosive oil, as gasoline, is always a dangerous factor in a mine, owing to the liability to fire or explosion. Notwithstanding these possible dangers, there are a number of gasoline motors employed for various purposes in coal mines throughout the country. The danger of their use is greatly increased by the possibility of a mine wreck when the gasoline tank might be injured and its contents take fire.

Ques.—In a mine subject to fires caused by spontaneous combustion, what is the first evidence of the existence of such a fire; and what steps should be taken to overcome the trouble?

Ans.—An experienced miner will detect the presence of a fire in the waste or abandoned workings, by the peculiar odor perceptible in the air current and which would escape the notice of one less familiar with coal-mining conditions. The presence of mine fires is also indicated by the heating of the walls inclosing the space where the fire is in progress. As time progresses and the fire gains strength, smoke and gases are produced in abundance.

The treatment of mine fires depends so largely on conditions that it is impracticable to outline a method of procedure that would be applicable in all cases. In the early stages of a gob fire, the burning material can frequently be removed and carried out of the mine. While such a fire may often be extinguished by water, the later heating of the waste material in the gob is greatly accelerated by the presence of the moisture and the trouble thereby increased.

Where it is possible to isolate the fire by building stoppings to prevent the entrance of air to that portion of the workings, the fire can often be smothered and extinguished by such means. In some cases, carbon dioxide (CO_2) has been injected into the inclosed area with good effect. Where a mine fire has gained considerable headway, and these remedies fail, recourse must be had to drowning the fire out by flooding the mine with water.

Ques.—Mention the particular characteristics of coal, in respect to chemical composition and texture, that render it more liable to cause an explosion, in the processes of mining.

Ans.—The bituminous and lignite coals containing from 30 to 40 per cent. of volatile matter are the most inflammable. When the texture of these coals is such as to produce a fine impalpable dust that is readily thrown into suspension in the air, there is the greatest liability to explosion in mines. Briefly stated, the liability to explosion depends chiefly on the inflammability of the dust and the fineness of the floating particles.

Ques.—State the advantages and disadvantages of large slow-running fans, as compared with small high-speed fans, in the ventilation of a mine.

Ans.—A large slow-running fan possesses a greater margin of expansion; or, in other words, possesses a wider range of capacity than a small high-speed fan designed for the same conditions. If an emergency arises in the mine calling for a large increase of air, the large slow-running fan is more capable of producing such increase than is the case with a small fan that is already running at a high speed in performing its normal work.

The chief advantage in a small high-speed fan is the reduction in the first cost or the cost of installation, owing to lighter foundations being required and a less weight of material being used in the construction of the fan wheel and its housing.

Coal and Coke News

Washington, D. C.

Advices brought to the Federal administration from competent sources are to the effect that, up to date, in spite of the dislocation of affairs caused by the development of war conditions, there has been but little effect on the revenues of railroads in consequence of the disturbance.

Thus, for example, in the case of the Chesapeake & Ohio Ry., it is stated that the earnings of the concern have not been at all affected by the war, but that coal loadings during a recent week since the opening of the war assumed record proportions, while those of the period just before and just after this exceptionally prosperous week were likewise very satisfactory. Other coal roads report similar conditions, notwithstanding that at some mines there has been a shortage of hands for operation, owing to the circumstance that many of the former operatives have been leaving this country in order to participate on one side or the other in war-like operations in Europe.

To some extent, it is stated here, the places of these men will be taken by operatives who have not heretofore been fully employed or who have been employed on part time and whose work has consequently not been a maximum. It is also believed that a certain number of men will be attracted back into mining from other occupations in which it is found that the war situation necessitates a reduction of running time or in other particulars limits the quantity of the output that can be furnished to the market. Some of these men are former miners who have been withdrawn by the more favorable opportunities in other lines of activity.

It also appears that immigration of laborers from nations which have heretofore furnished a considerable number of practical miners is likewise being resumed so that there will be some influx of European laborers that will offset the shortage caused by the withdrawal of those who have gone abroad to perform military service.

Plans for Coal Exportation

The action of the administration in urging upon Congress a war risk insurance measure, which has just passed the Senate, and a bill authorizing the President to purchase a large number of ships for the purpose of creating the nucleus of a steamship line, has been confessedly taken in part for the purpose of maintaining and facilitating our export of fuel, which, along with foodstuffs, constitutes conditional contraband under a good many circumstances.

It is stated by the administration representatives that there is every reason to suppose that much coal can be sold in South America, and that, assuming the new government line to be established as proposed, it will be the endeavor of those in charge to make exceptionally favorable rates to American coal presented for exportation to the Isthmus of Panama and to countries south of the canal.

None of these countries will be able to import coal from Europe, and it is supposed they will turn to the United States. Special attempt is being made to facilitate the financing of South American business generally, and the understanding now is that a substantial degree of success has been attained in making these arrangements. It is asserted at the Department of Commerce that particular inquiries are already being made in South America concerning the details of conditions surrounding the sale and shipment of consignments of fuel.

There is every reason to suppose that the war risk insurance bill will be adopted, thereby eliminating the probability of losses due to the seizure of fuel which is in process of transit from the United States to foreign buyers. More resistance is being offered to the passage of the ship purchase bill, but that also is believed likely to become law in some form before a great while. With the improving outlook as to foreign exchange, this is expected to relieve the export situation materially.

Many Bills Have Been Introduced

During the past week, there have been introduced or acted upon in Congress a number of bills affecting mining products and coal particularly in one way or another. One which has received some attention is represented by Representative Deitrick, forbidding the exportation of mining products, and reading, in part, as follows:

That it shall be unlawful for any person, firm, association or corporation to export any goods, wares, merchandise or products of the soil or mines; provided, however, that the President of these United States may from time to time permit the exportation of such articles and in such quantities as in his judgment the general welfare of the country will permit.

Sect. 2. That any person, firm, association or corporation, and any agent, director or officer who is found guilty of violating any of the provisions of this act shall be punished by a fine not exceeding $10,000 and by imprisonment for a period of not less than one year nor more than five years.

Sect. 3. That all cases arising under the provisions of this act shall take precedence of all other cases in the courts having jurisdiction thereof, and the President is hereby authorized to appoint such additional judges and all necessary court officers to secure the prompt trial and determination thereof, both in the courts of original jurisdiction and in any other court.

Sect. 4. That this act shall take effect upon passage.

An important measure relating to the disposal of coal and mineral deposits in Indian lands has just been passed by the Senate in the following terms:

That where the coal or other minerals contained in any lands embraced in any Indian reservation which has been opened to settlement and entry, have been reserved from disposition, the reservation of such coal and other minerals shall inure to the benefit of the Indian tribe or tribes to whom such Indian reservation belonged, and all proceeds arising from the disposal of such coal or mineral deposits as may be determined by law shall be deposited in the Treasury of the United States and shall be applied in the same manner as the proceeds derived from the disposal of the lands contained in the reservation within which such coal or mineral deposits are located.

The Senate has also passed an act providing for the purchase and equipment of a mine-rescue car to operate in the Southwestern coal fields especially. The bill for this purpose contains the following provision:

That the Secretary of the Interior is hereby authorized and directed to purchase and equip a mine-rescue car for advancing mine safety work in the Southwestern coal fields, with headquarters at Fort Smith, Ark.; and there is hereby authorized to be appropriated for the purchase and equipment of such car the sum of $10,000, and for the operation and maintenance of said car during the fiscal year 1915 the sum of $16,500.

The Senate has also passed and sent to the House of Representatives an important act intended to amend the act extending the homestead laws of the United States, and providing for right-of-way for railroads in Alaska. This amendatory act refers primarily to agricultural land, but has a direct bearing upon the coal situation in Alaska as seen in the change made in that part of the law which fixes the price of the land to be homesteaded, but exempts mineral and coal lands. Sect. 10 of the amended law, which is the provision bearing on this subject, reads as follows:

That any citizen of the United States, 21 years of age, or any association of such citizens, or any corporation incorporated under the laws of the United States or of any state or territory, now authorized by law to hold lands in the territories, hereafter in the possession of and occupying public lands in the District of Alaska in good faith for the purposes of trade, manufacture or other productive industry, may each purchase one claim only not exceeding 80 acres of such land for any one person, association or corporation, at $2.50 per acre, upon submission of proof that said area embraces improvements of the claimant and is needed in the prosecution of such trade, manufacture or other productive industry, such tract of land not to include mineral or coal lands, and ingress and egress shall be reserved to the public on the waters of all streams, whether navigable or otherwise.

PENNSYLVANIA

Anthracite

Bellevue—A fire on Aug. 19, in the Diamond vein of the Von Storch colliery of the Delaware & Hudson Co., shut off 15 workmen from the slope entrance and they had to go several miles in a roundabout way to escape. The city fire department extinguished the blaze.

Pittston—Fearing that a mine cave may occur at any moment, a portion of upper Williams St. was roped off on Aug. 20, and traffic on the street near the Erie R.R. crossing is barred. The spot where the cave is expected is guarded with a fence around it. Passengers on the trolley lines are transferred to cars at another point. The company officials expected the cave to occur at any time. It is believed that several properties will also be seriously affected by the cave.

Harleigh—A fire of mysterious origin totally consumed the boiler house of the Harleigh-Brookwood Coal Co. on Aug. 15, but the breaker, which is located nearby, was saved. The blaze, which started shortly before midnight, originated in the pump room in the extreme eastern end of the building. Two of the boilers next to the pump house were not in use at the time, and as only electric lights were used in the building, the management is at a loss as to account for the origin of the fire. Arrangements have been made for immediate repairs, so that work at the colliery can be resumed at an early date. The fire did not interfere with the pumps in the mines, as they are operated by electricity.

Sunbury—Judge Moser, in the Northumberland county courts, on Aug. 17, filed an opinion refusing to materially lower the assessments on 15,000 acres of coal lands, the taxable value of which has been fixed at $17,369,841 by the board of county commissioners for the three years ending with 1915. The rate for the previous three years had been but $7,674,212, which makes the increase approximately $9,000,000. Because of the ruling, increase in taxes to the county will be $120,000 for the three years. After the commissioners raised the valuation to that fixed by Judge Moser, the Philadelphia & Reading Coal & Iron Co, the Mineral R.R. & Mining Co., the Lehigh Valley Coal Co., owners of the bulk of the land, took appeals, and an exhaustive inquiry was made.

Bituminous

Punxsutawney—The Buffalo, Rochester & Pittsburgh R.R., which has been making heavy shipments of coal into Canada since the outbreak of the European war, must hereafter ship no coal to the Dominion except in Grand Trunk Ry. cars. This is a result of the government's neutrality embargo, and will bring the coal shipments of this road to Canada to about 100 cars a day, whereas it has been shipping in the last few weeks from 500 to 1000 cars a day.

Johnstown—W. M. Brown, superintendent, and two mine foreman, Thomas Townsend and J. C. Patterson, of the Miller shaft of the Shoemaker Coal Mining Co., have been held for court on charges of violating the state mining laws. The informations were preferred by State Mine Inspector Thomas D. Williams. Brown is alleged to have failed and refused to instruct his foremen to provide safe and available passageways from the mainway to the interior of the mine workings. The foremen are charged with failing and refusing to provide the animal and mechanical haulage roads in the mines with holes for shelter, 4 ft. deep, at intervals of at least 15 ft.

Bentleyville—The West Penn Lighting Co. has secured the contract for furnishing power to several mines being opened on the line of the Montour railroad. These are at McDonald, Bishop, Thompsonville and Hills, and the Henderson Coal Co.'s new mines at McPherson Mills. Three miles of line will be constructed to the last named mine, where current for 1100 hp. will be supplied. The West Penn company recently secured the contract for furnishing power for the Pittsburgh-Buffalo Co.'s Hazel mine, at Cannonsburg.
